SWEET CHERRIES.—These kinds may now be planted, and if they are to be grown on walls, the borders should be put in good order, by incorporating with the staple some moderately heavy fibrous loam, burnt earth, and old plaster or lime-rubbish, and if the staple is of poor quality, a little well-decayed manure will be of advantage. One great point is to keep the foliage clean and free from insects in the summer, and the planter should be careful that the shoots experience no rough usage, as this may subsequently lead to gumming and loss thereby of the main branches. Peaches, Nectarines, Plums, Apricots, and Cherries are all more or less liable to gumming. The following varieties of Cherries will be found to give satisfaction, viz., Belle de Orleans, River's Early, a fine black variety of good all-round properties; Frogmore Bigarreau, Governor Wood, Kentish Bigarreau, Napoleon Bigarreau, Elton, Black Eagle, Black Tartarian, Florence and Emperor Francis.

EDITORIAL NOTICES.

LOCAL NEWS.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

ILLUSTRATIONS.—Photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c., are particularly solicited.

NEWSPAPERS.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

Advertisements should not be sent to the Editor, but to the Publisher.

APPOINTMENTS FOR THE ENSUING WEEK.

MEETINGS.

TUESDAY, Nov. 15 { Royal Horticultural Society, at Drill Hall, James Street, Westminster, lecture at 3 P.M., on "Pelargoniums for Autumn Flowering," by Mr. Pearson, of Chilwell, Nottingham.

SHOWS.

TUESDAY, Nov. 15 { Royal Horticultural Society, at Drill Hall, James Street, Westminster.
Chrysanthemums at Plymouth (two days), Liverpool (two days), Reading, and Wimbledon (two days).

WEDNESDAY, Nov. 16 { Chrysanthemums at Hull, Rugby, and Sleaford (all two days); also at York (three days).

THURSDAY, Nov. 17 { Edinburgh Chrysanthemum (three days); Norwich Chrysanthemum.

FRIDAY, Nov. 18 { Stockport and District Chrysanthemum, and Chorley Chrysanthemum (two days).

SALES

MONDAY, Nov. 14 { Bulbs and Plants at Protheroe & Morris' Rooms.
Dutch Bulbs, at Stevens' Rooms.

TUESDAY, Nov. 15 { Orchids and Bulbs, at Protheroe & Morris' Rooms.
Sale of Nursery Stock at Barnham Nurseries, near Bognor, by Protheroe & Morris (two days).

WEDNESDAY, Nov. 16 { Bulb Sale, at Protheroe & Morris' Rooms.
Dutch Bulbs and Lilliums, at Stevens' Rooms.

THURSDAY, Nov. 17 { Plants from Belgium, Seeds, Bulbs, &c., at Protheroe & Morris' Rooms.
Dutch Bulbs and Lilliums, at Stevens' Rooms.

FRIDAY, Nov. 18 { Orchids and Bulbs, at Protheroe & Morris' Rooms.

SATURDAY, Nov. 19 { Bulb Sale at Protheroe & Morris' Rooms.
Dutch Bulbs and Lilliums, at Stevens' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—42° I.

The Chrysanthemum. The development of the Chrysanthemum within the last few years, though not to be compared in scientific interest with the production of the tuberous Begonia, is, in any case, very remarkable. The whole history of the plant, with illustrations of the wild species, has been repeatedly given in our columns, so that we need hardly enter into those particulars again, especially as such details are only likely to interest a few among the huge army of Chrysanthemum devotees. But even if we take the Chrysanthemum from the point of view of the ordinary lover of flowers, how great has been the progress since ROBERT FORTUNE first sent home the Japanese varieties, and what a welcome change has been arrived at from the stiff formality of the incurved varieties! Now, at least, all parties can be satisfied! Those of us who like the perfect symmetry of the large-flowered incurved forms can still indulge their proclivities; whilst others, who see their ideal of beauty in reflexed varieties, in the Anemone-flowered section, or in the Pompons, can each and all find what they want. This is

an immense advance upon the cruel despotism of the old florists. Some day—oh, may it be soon!—we may be similarly relieved in the case of the Show Dahlia. The formality of that flower, so much admired of some, is to others frightful. All can admire the colour; all can wonder at the plasticity of Nature, and the patient perseverance of the gardener, but it is only the few that can appreciate such a form. Now that the public has seen what can be done in the case of the Chrysanthemum, they will never remain contented with one single type of beauty when so many are open to them. The single Dahlias, the Cactus Dahlias, the Juarezi set, are all steps in the right direction, and, as we hope, indicators of future progress. But to revert to the Chrysanthemum. It is obvious that they are no longer to be judged by one inelastic standard, but that a special standard must be—indeed, is—applied to each section. The great defect of the old florists' standard was its purely arbitrary character. Its points and pronouncements were often unobjectionable, or even praiseworthy in themselves, but they had little or no reference to the flower itself. They would have applied equally well to something cut by a mechanic out of paper or velvet. The whole history and significance of plant construction, and the distribution of its colour; its marvellous life-history were entirely ignored, and rules were laid down as if we were dealing with pieces of tin instead of with living beings, with requirements and feelings, not so very different fundamentally from those possessed by ourselves. Yet, will those who think this an exaggerated statement tell us how and where they are going to draw the line between plants and animals, how they are going to distinguish between the sensibility to external impressions shown by the plant protoplasm, and the corresponding phenomena witnessed in the nerve tissue of the animal?

Depend upon it, the more fully we recognise the fact that plants are living beings—like ourselves—the better we shall grow them, and the purer our standard of taste will become.

The section of Chrysanthemums which is the nearest to Nature, and the one, therefore, that should be taken as the standard, is, of course, the Anemone-flowered group. There the ray florets and the disc florets are present as Nature makes them in the wild plant; and all we have to do is to follow her indications and emphasise those portions she makes prominent, and subordinate those which are of less importance in the economy of the plant. The construction of the natural flower is clearly adapted to the requirements of the flower as regards insects. The ray florets are the advertisement boards and signs to attract the notice of the passing insect. By developing the colour of these florets, then, we are following the natural indications.

But, it may be said, this standard is all right enough for the wild plant, but as gardeners, our requirements are quite different. We do not grow the flowers for the seed, except in some cases. We can propagate the plant by cuttings or layers, and are not solely dependent on the flowers, and therefore we can afford to dispense with the flower, as, indeed, we do practically, for many or most of our most admired "flowers" are partly or absolutely sterile.

The gardener must, it is true, cater for the whims and fancies of the hour. But he can gradually and indirectly improve the public taste by demonstrating that natural—shall we say, reasonable—forms and arrangements are necessarily the most beautiful of all; whilst the

monstrosities, cripples, and deformities which constitute the bulk of our fancy flowers, however remarkable as physiological illustrations, are not consistent with any great appreciation of floral anatomy, or with a high ideal of beauty. We have all of us a long way to go before we arrive at such a degree of perfection, but it is, at least, incumbent upon us to be always on the right road.

WASHINGTONIA FILIFERA.—We give an illustration this week (p. 591) of *Washingtonia filifera*, the magnificent Palm of South California and Arizona, from a specimen growing in the open air in the gardens of the late Dr. T. G. RICHARDSON of New Orleans. Both Dr. RICHARDSON and his amiable wife had for many years been very successful in introducing and cultivating what are regarded as hardy and half-hardy Palms, and their collection formed one of the most interesting and extensive in the Southern United States. They possessed numerous species of Phoenix, Sabal, *Chamaerops*, *Serronoias*, *Livistonas*, and *Rhapis* growing in the open air. These plants were able to undergo a considerable degree of cold during some winters, the thermometer falling in extreme cases as low as 20° Fahr. The only protection the more tender plants received, was an occasional covering of dry hay-bands placed round their stems and leaves. The subject of the present notice is a striking plant, and as it is comparatively new in collections in this country, a few words respecting it may be of interest. Mr. W. WATSON in the *Kew Bulletin*, 1892, p. 296, speaks of it "as one of the glories of the Riviera gardens." It was first brought to notice by Dr. C. C. PARRY, who discovered it in California in 1849 or 1850. It was first named *Brahea dulcis*. WENDLAND afterwards placed it as *Pritchardia*, and finally, the same author founded upon it the genus *Washingtonia*. Apparently, according to Mr. WATSON, it was not introduced into European gardens until 1875. Notwithstanding this, there are some large specimens of it on the Riviera. At Villa Valetta, on a sloping lawn in front of the house, is a grove of about sixty of this magnificent Palm. The rate of growth, under suitable circumstances, appears to be so rapid that the plant has evidently a great future before it in sub-tropical countries.

We are indebted to the kindness of Mr. HARRY PAPWORTH, Mrs. RICHARDSON's gardener, for this and other photographs of fine palms growing in her garden, and which we may at some future time publish in these pages.

ROYAL HORTICULTURAL SOCIETY.—The Council of the Royal Horticultural Society, sympathising with the efforts of various County Councils, technical institutes, schools, gardeners' mutual improvement societies, and other bodies to promote instruction in practical horticulture by means of lectures, demonstrations, &c., and in the hope of rendering such teaching more definite and effective, have consented to hold an examination in horticulture in the first week of May, 1893. The following is an outline syllabus, showing the nature of the subjects to which it is considered desirable that the attention of students should be drawn, but it is not expected that the whole should be dealt with in one short series of lectures and demonstrations; selection should, therefore, be made according to local circumstances, but a sufficient knowledge of the elementary principles will, in all cases, be required.

Examination in Horticulture.—The examination will be held simultaneously in as many different centres in England and Wales as circumstances may demand. The examination will be based on the outline syllabus of "Elementary Principles and Horticultural Operation and Practice" to be found below, but arrangements will be made so far as possible to frame the questions so as to cover the ground of any syllabus sent up for that purpose to the society before the first day of March. It will, however, in all cases, be absolutely essential for students to exhibit a sufficient knowledge of the "Elementary Principles" named in the syllabus.

Two sets of questions will be set: one of an elementary character, called the Lower Grade, and one more advanced called the Higher Grade, and those who intend to sit for examination must decide beforehand under which grade they will be examined, in order that a sufficient number of papers in each grade may be sent. In each grade 300 marks will be given as a maximum. Candidates gaining 200 marks and over will be placed in the first class. Those gaining 150 to 200 will be placed in the second class. Candidates failing to obtain half-marks (150) will not be classed. The Royal Horticultural Society will award a Silver-gilt Medal to the candidate gaining the highest number of marks in the first class in the Higher Grade, and a Silver Medal to the highest in the First-class in the Lower Grade, and will, if the

also send in the full name and address (with designation or occupation) of one responsible person for each proposed centre, who will undertake to supervise the examination in accordance with the society's rules. The duties of the supervisor will be as follows:—

- a. To satisfy himself that the room proposed for the examination is a suitable one for the purpose, and to see that a sufficient quantity of foolscap paper, all of one size, is provided for the use of the candidates.
- b. To satisfy himself that all candidates belonging to his centre have been duly acquainted with the place, day, and hour of examination. This may be done by communicating with the lecturer or with the secretary of the County Council, &c.

inform students distinctly of the exact hour at which all papers must be handed in.

g. To see that the following rules are strictly observed:—

1. Two and a half hours are allowed for the papers.
2. Students are not allowed to bring any books, paper, notes, &c., into the examination-room, nor to ask any questions whatever, save of the supervisor, who must exercise his judgment as to whether such question is one he should answer or not.
3. Students are not allowed to leave the examination-room on any pretext whatsoever after the papers have been distributed. In case of unavoidable illness, the student must be content either to hand in what he has already done, or to wait till another examination takes place.
4. Any student leaving the room before the full time allowed has expired, must first give up to the supervisor his written papers, together with the printed examination paper, which must in all cases be returned with the answers.
5. The papers of any students breaking these rules or found copying should at once be destroyed.
- h. The allotted time having expired, the supervisor will call on the students to fold up and hand in their papers, which should then be at once (before leaving the room), tied together securely with string. They should be posted to the Secretary, Royal Horticultural Society, 117, Victoria Street, Westminster, S.W., by the earliest possible post.
- i. The supervisor will, of course, not himself leave the room during the time of examination.
- k. The supervisor is requested to sign the printed paper sent with examination papers, and return it with them. This paper is to the effect that the rules of the Society have to the best of his knowledge been strictly observed.

If there should be more than 25 candidates at any one centre, an assistant supervisor will be required, and one additional supervisor for every additional twenty-five candidates. The Council reserves to itself the right to modify the application of these regulations as they may consider necessary, and all disputed questions of interpretation and procedure must be referred to them for final decision.

Elementary Principles, on which horticultural practice is based:—Soils, good and bad: their nature and composition; weeds and their indications. Requirements of Growth: water, heat, air. Seeds: nature of, duration of vitality in, and modes of germination. Roots: nature and functions of; fibrils and root-hairs, what they do, and how they do it; what helps and what hinders them. Stems and Branches: their nature, work, and uses; helps and hindrances to their work. Leaves: what they are, what they do; helps and hindrances to their work. Tubers and bulbs, leaf-buds, and flower-buds. Growth and Development: increase in size and changes of composition and structure; formation and storage of food materials. Flowers: their component parts, what they do; artificial fertilisation. Fruit: changes and development during ripening; forms and varieties, as, e.g., Apple, Strawberry, Plum, &c. Seed: formation of. Variation and selection. Names and orders of common garden plants, trees, &c.

Horticultural Operations and Practice.—Surveying and landscape gardening, elements of. Choice of site for a garden. Description and use of implements under each head. Operations connected with the cultivation of the land, with explanations and illustrations of good and bad methods: digging and trenching; draining, hoeing, stirring the soil, and weeding; watering, preparation of seed beds; rolling and raking; sowing, transplanting, and thinning; potting, planting; aspects, positions, and shelter

FIG. 90.—WASHINGTONIA FILIFERA, IN MRS. RICHARDSON'S VILLA GARDEN, NEW ORLEANS. (SEE P. 590.)

County Council or other body promoting the lectures wish it, deliver to their candidates certificates of the class in which they shall have passed. County Councils, lecturers, &c., wishing students to sit for examination must send in to the Society, not later than the first week in April, the total approximate number of students they will present in each grade; the actual number at each proposed centre will be required ten days before the examination takes place. Gardeners and students wishing to sit for the examination, but who have not attended any particular series of lectures, must send in their name and address to the Secretary, R.H.S., 117, Victoria Street, Westminster, not later than the first week in April, when they will be informed of the nearest centre at which an examination will be held. A small capitation fee will be charged for every student in order to partially defray the expenses of the examination. County Councils, lecturers, &c., must

- c. To receive the sealed parcel of papers which will be posted to him from London two clear days before the examination. N.B.—If the papers do not arrive by the first post on the day of examination, he should immediately telegraph to the secretary of the society, 117, Victoria Street, S.W.
- d. To preserve the seals of the parcel, unbroken, until he opens it in the presence of the candidates at the hour fixed for the examination to commence.
- e. To distribute one copy of the examination paper to each candidate according to grade. It is better that the candidates should be seated Higher and Lower Grade alternately, and not too closely together.
- f. The supervisor will then immediately read aloud the directions printed at the head of the papers, make a note of the exact time, and

staking, earthing, and blanching, &c. Propagation—Elementary principles: cuttings; budding and grafting, stocks used; layering, division, branch-pruning, root-pruning—old and young trees and bushes; training. Fruit culture: open air and under glass; small fruits, Apples and Pears, stone fruits, gathering and storing, packing and marketing; general knowledge of fruits, and selection of varieties. Vegetable culture: Tubers and roots, green vegetables, fruits and seeds, rotation of crops, and selection of varieties. Flower culture: outside and under glass. Manures and their application. Improvement of plants by cross-breeding, hybridisation, and selection. Arboriculture: trees and shrubs, and their culture. Insect and fungus pests, prevention and treatment.

Books.—*Primer of Botany* (MacMillan & Co.), Sir J. D. Hooker, K.C.S.I. *Botany for Beginners* (Bradbury, Agnew & Co.), M. T. Masters, M.D., F.R.S. *Plant Life* (Bradbury, Agnew & Co.), M. T. Masters, M.D., F.R.S. *Popular Gardening*, 4 vols. (Cassell & Co.), edited by D. T. Fish. *Epitome of Gardening* (Adam, Black & Co.), T. Moore and M. T. Masters. *Agriculture*, part i. and ii. (John Murray), W. Fream, LL.D.

ROYAL HORTICULTURAL SOCIETY.—The next meeting of the above will be held on Tuesday next, November 15. At 3 P.M. a lecture on "Zonal Pelargoniums for Autumn Flowering," will be given by Mr. C. PEARSON.

LINNEAN SOCIETY.—This Society met on Thursday, November 3, Professor STEWART, President, in the chair. Mr. W. B. BOTTOMLEY was elected. The Rev. Professor HENSLOW exhibited an instrument used in Egypt for removing the end of the Sycamore Fig, and gave some account of the mode of cultivation. The Rev. E. S. MARSHALL exhibited some hybrid Willows from Central Scotland, believed to be rare or new to Britain. Mr. C. T. DRURY exhibited some new examples of apospory in Ferns, namely, a specimen of *Athyrium filix-femina* var. *Clarissima*, with pinna showing development of prothalli by soral apospory, and a seedling, *Lastræa pseudo-mas cristata*, showing prothalli developed aposporously over the general surface of the frond (pan-apospory). Mr. J. E. HURTING exhibited some live specimens of the short-tailed field vole, *Arvicola agrestis*, and gave an account from personal inspection of the serious damage done by this little rodent upon the sheep-pastures in the lowlands of Scotland. Mr. A. B. RENDLE exhibited some seedling plants of the Sugar-cane, which had been raised in this country by Mr. VEITCH. The discussion on several of these exhibitions having continued until a late hour, a paper by Professor HENSLOW, "On a Theoretical Origin of Endogens through an Aquatic Habit," was by consent adjourned to the next meeting of the Society, which will be held on Thursday, November 17, in the evening, at 8 P.M., when the following papers will be read:—"A Theoretical Origin of Endogens through an aquatic habit," by Rev. Prof. HENSLOW, F.L.S., &c., and "On the Buprestidae of Japan, and their Coloration," by G. LEWIS, F.L.S.

HISTORY OF ENGLISH GARDENING.—The Hon. ALICIA M. T. AMHERST and Mr. PERCY E. NEWBERRY have in preparation a work on the *History of English Gardening*. The first part of the book—that dealing with the period extending from the Roman Conquest to the end of the sixteenth century—will be a republication [by permission] in chapter form, and with considerable additions, of the articles by Mr. NEWBERRY, which appeared in our columns in 1888, 1889, and 1890. The work will be elaborately illustrated, and will be published by Mr. QUARITCH early in 1893.

NATIONAL CHRYSANTHEMUM SOCIETY'S SUPPLEMENTARY CATALOGUE.—Those of our readers who are interested in Chrysanthemum culture will be glad to learn that the above has now been issued,

and may be obtained from E. W. ALLEN, 4, Ave Maria Lane, E.C., and R. DEAN, Ranelagh Road, Ealing, W. This list, which is complementary to that issued by the Society two years ago, will be found to contain all that is of merit amongst novel varieties from the older sources, but excluding for the present those which have been raised in Italy. The list is a sufficiently long one without these, containing, as it does, so many early large flowered novelties from French raisers, who are devoting much attention to this section. We learn from the preface that although the majority of new varieties are of foreign origin, home raisers have contributed not a few of the finest show flowers, and that their efforts in this direction are not likely to be relaxed. The collaborators of the new list are Messrs. E. C. JONES, G. GORDON, H. SHOESMITH, A. TAYLOR, and C. HARMAN PAYNE.

OPEN SPACES.—At the monthly meeting of the Metropolitan Public Gardens Association, the Earl of MEATH presiding, progress was reported with regard to the laying-out of the Duncan Terrace Enclosure, N., and Goldsmith Square, E. The usual arrangements being made regarding future maintenance, it was decided to undertake the laying-out of St. Mary's Churchyard, Woolwich, St. Thomas' Square, Hackney, and a playground at Kentish Town, at a total cost of about £1500, if sufficient funds could be secured for the purpose. Letters were read from the Kensington Vestry consenting to plant trees in Queen's Gate and Exhibition Road, S.W., adjoining the Natural History Museum; and from the Vestry of St. Botolph's, Bishopsgate, providing a sum of money for the improvement of the parish churchyard. Amongst other schemes under consideration were the acquisition of the "Copperas," Bromley-by-Bow; Buffalo Bill's site, Earl's Court, S.W.; the Eton and Middlesex Cricket Ground, N.W.; the Cross Bones Burial Ground, Union Street, S.E., and a playground in St. Matthew's Parish, Westminster.

THE LORD MAYOR'S SHOW.—To all who have a desire to see Britain grow her own fruits, the Trophy of Fruits, which formed one of the imposing features of the Lord Mayor's Show on Wednesday last, would give especial pleasure. The Worshipful Company of Fruiterers, with Sir JAMES WHITEHEAD, Bart., M.P., at its head, has done much to popularise fruit culture in this country, and the idea of a trophy forming part of the procession was a very happy one. The designing and carrying out of this idea was entrusted to Messrs. GEO. BUNYARD & Co., of Maidstone, and the result was exceedingly satisfactory. It is noteworthy that Mr. GEO. BUNYARD was afforded assistance by his brother Fruiterer, Mr. JOS. CHEAL, of Crawley, and by several other well-known Kent fruit specialists. It was constructed on one of Messrs. PICKFORD'S trollies, and upon a central stage with sloping sides, handsome fruits of most kinds and all British grown were exhibited. One of the corners was dedicated to each of the counties growing the greatest acreage of fruit, Hereford, Worcester, Devon, and Kent. We have not space to further describe this new feature of an old institution, suffice to add that such a trophy was produced (and without the aid of flowers of any description), that it added materially to the attractiveness of the show, and was worthy of the Fruiterers' Company, and of home fruit-growers generally.

MOOREA IRRORATA.—This handsome Orchid, described by Mr. Rolfe in our columns, and figured in 1892, vol. xi., fig. 73, forms the subject of a coloured plate in the current number of the *Botanical Magazine*, t. 7262. The flowers are brownish-orange, the lobes of the lip straw-coloured, and marked with purple stripes.

CARLUDOVICA MICROCEPHALA is an interesting addition to a very curious and beautiful group, allied to the Palms. It has a short stem (3 to 4 inches only), marked with the rings of fallen leaves, and bearing at the top a few stalked, wedge-shaped,

plicated leaves, deeply dividing into two lanceolate lobes. The spadix is stalked with two spathe at the top, and bears an oblong mass of flowers at the summit. According to Wendland, it is a native of Costa Rica. It flowers at Kew every year, and is figured in the *Botanical Magazine*, t. 7263.

CALOCHORTUS KENNEDYI, Porter.—The petals of this new species are brilliant scarlet, with a dash of yellow in it. Mr. BAKER speaks of it as the most showy of the many new species discovered since he published his monograph in 1875. The figure in the *Botanical Magazine*, t. 7261, is taken from a plant that flowered at Kew.

CHAMÆDorea STOLONIFERA, Wendland.—A dwarf Palm, with stems a yard high, as thick as the little finger, and producing numerous stolons at the base, by means of which the plant is propagated. The leaves are wedge-shaped, deeply divided into two lanceolate lobes. The small globose yellow flowers are sessile, on loosely branched spikes. It is a native of Southern Mexico, and is figured in the *Botanical Magazine*, t. 7265.

RANUNCULUS CARPATICUS.—A large-flowered species, with thick creeping root-stock, and palmately-divided leaves. The blooms are variable in size, but when large, render the plant very showy. Kew. *Botanical Magazine*, t. 2766.

NORTH OF SCOTLAND ROOT, FRUIT, AND VEGETABLE ASSOCIATION.—The annual exhibition of this prosperous association was held in the Drill Hall, Inverurie, N.B., on Saturday, the 5th inst. The entries this year—which may be termed a year of unusual disaster—numbered 609 as against 630 last year, when the Association reached its majority, so that in spite of the adverse climatic influences the entries had not fallen off much. The finances are also in a flourishing condition, there being a substantial balance to the credit of the account.

CORBRIDGE AND DISTRICT GARDENERS' MUTUAL IMPROVEMENT SOCIETY.—The second monthly meeting of the above, which was formed on September 27 this year, was held in the Town Hall, Corbridge, on Monday evening, October 31. Mr. A. OLIVER, the head gardener at Beaufront Castle, presided, and the attendance of members was good. Mr. BELL, gardener at Bythorn, read an instructive paper on "The Mechanism of Plants," which was followed by an interesting discussion, the chairman also making some appropriate remarks on the subject, and giving some good advice to the younger members. It has long been felt that a society for the improvement of gardeners was wanted in the district, and now that one has been started, and is in fair working order, it is hoped it will go on and prosper.

MESSRS. WM. FELL & Co.—This well-known Hexham firm, we learn, have again been favoured with an order for a large quantity of forest trees of various kinds from Her Majesty's Commissioners of Woods and Forests, to be planted in the Crown lands in the Isle of Man. They have also received a large order for fruit bushes from the Canadian Government for experimental purposes.

STOCK-TAKING: OCTOBER.—Since the last occasion for stock-taking, the Board of Trade has published a mass of figures concerning a year's trade of the country, and compared these with the previous ten years' record. The statistics are truly astounding, and should "give pause" to such as are inclined to "deplore the decadence of British trade," as they are pleased to term a momentary check. We learn that our trade has increased over fifty millions sterling in ten years, *i.e.*, from £694,000,000 in 1881 to £744,000,000 in 1891 (all told). In 1888 our trade with "the States" was £122,000,000; £139,000,000 in 1889; £143,000,000 in 1890; £145,000,000 in 1891. There is no getting away from these facts, any more than there is from this—that, population for population, our trade is enormously in excess of that of the principal "protected" countries, France and the United States. Not a word of comment is

necessary here, and so we proceed to consider the trade of the past month, placing before the reader the usual extracts from the "summary" of the imports for the month of October as prepared by the Board of Trade:—

IMPORTS.	1891.	1892.	Difference.
	£.	£.	£.
Total value for month	£36,873,829	£34,726,858	—2,146,971
§II.—(A.) Articles of food and drink—duty free	12,929,033	11,995,301	—933,732
(B.)—do., dutiable	3,323,452	3,165,473	—157,979
§VI.—Raw materials for textile manufactures (including Flax, Hemp, and Jute)... ..	5,423,318	4,444,693	—978,625
§VII.—Raw materials for sundry industries and manufactures (including wood and timber, hewn, sawn, split, dressed; vegetable materials, for paper-making, &c.)	4,038,042	4,272,368	+234,326
§IX.—Miscellaneous articles (including Clover, Grass, Flax, Rape, Linseed) ...	1,301,447	1,335,734	+34,287
(B.)—Parcel Post ...	59,452	55,519	—3,933

The decrease of imports amounts to £2,146,971 value; there was one working day less in the month, and this with the great reduction in the price of the Wheat imported, accounts for the apparent decline. The imports of Wheat from Russia are very small; those from America, simply enormous. No wonder agriculture is depressed, when we remember how much there is of placing all the eggs in one basket. In vain, it would seem, is attention called to the enormous ever-increasing imports of eggs, butter, cheese, &c.; useless to keep on saying that it is cheaper to import from Denmark or France, than to try to get in produce other than cereals. Surely, this state of things is a disgrace to all parties. It is our duty only to notice it. When trade between farm and market-place is properly regulated, there will be less cause for grumbling than now exists. The following extracts from the figures relating to imports of fruits and vegetables for the past month have their share of interest for those interested:—

IMPORTS.	1891.	1892.	Difference.
Fruits, raw:—			
Apples bush.	593,472	859,658	+266,286
Cherries "
Plums "	...	1,182	+1,182
Pears "	...	72,776	+72,776
Grapes "	...	277,852	+277,852
Unenumerated, ..	706,685	78,671	+628,014
Onions "	474,881	563,528	+88,647
Potatoes cwt.	44,135	115,857	+71,722
Vegetables, unenumerated, raw, ... value	£66,805	£72,461	+£5,656

We wait with patience for the disappearance of the word "unenumerated" from our little table.

THE EXPORTS

for the month of British and Irish produce foot up a total value of £18,725,460, or a decrease of £2,440,653, as compared with October in 1891. Anything but improvement here, it may be said, but there being five Sundays in October, gives one working day less, and that signifies a great deal; nearly as much may be placed to the account of diminishing invoice prices, or a loss of profit on work done not covered by cheapness of raw material. But we cannot get away from the fact that there is a heavy depression in trade, in textile fabrics and in metallic goods. This year does not stand an isolated instance of depression, we have had them before, and lived to laugh at foreborders of evil days. In Italy the signs are in favour of free-trading. Spain is discovering the error of its ways, and promises amendment in the matter of tariffs, and a great cry has gone up throughout the United

States in favour of true economy. Canada is learning how little she has to gain from her nearest neighbour, compared with what is to be had from England, and begins to incline a more willing ear to the blandishments of Sir JOHN LUNBOK. The rate of exchange on India is a serious drawback to trade, which can only be counterbalanced to any appreciable extent by a large increase in the output of gold in the near future. "Turns for the better" have before now set in very quietly; it is not at all improbable that they will do so again shortly.

CHRYSANTHEMUM SHOWS.—Several reports of shows have reached us at the moment of going to press, but which we must defer to publish until next week. The Crystal Palace Show, on November 4 and 5, appears to have been productive of fine flowers and keen competition in the more important classes, whilst the specimen plants were, in some instances, insufficiently developed. Stroud, Gloucestershire, held a good representative exhibition on November 3 and 4.

HOME CORRESPONDENCE.

SHOW STANDS FOR JAPANESE CHRYSANTHEMUMS.—In your last issue, E. Molyneux kindly gave dimensions for boards to accommodate the very large blooms now exhibited. I should say exhibitors would do well to adopt them where they can; but instead of making new cases for carrying the blooms, why not use the present boxes and stands for the purpose by placing the large blooms in the centre, and putting the smaller ones, and the incurved, round the outside of the stands? Room, I think, would be found for them all to travel safely. By so doing, only one or two boards would be required for the large Japanese, which, as he says, could be taken loose, the blooms being placed in them at the show. It is not every gardener's lot to have an estate carpenter at his call. Perhaps our friend "E. M.," who is always ready to impart practical hints, will say what he thinks of the suggestion. *Jno. Masterson, Weston House Gardens, Shipston-on-Stroud.*

ROOTWORK.—If a number of first-class gardeners, amateur and professional, were asked their opinion of rootwork, the majority would say, "Have nothing to do with it; it harbours fungus and plant vermin, and will give great trouble." Perhaps you will allow me to give my experience. More than fifteen years ago we had a fence in sight of the drawing-room, which it was desirable to hide by a pretty object. I had heard of a rootwork near here, and, on going to see it, was told of a gardener in the neighbourhood who had much experience and good taste in rootwork. I then consulted many friends, amateur and professional. Most advised against. One lady told me her rootwork had to be pulled down on account of a noisome fungus; but two quite first-class authorities (one professional, the other Mr. Berkeley) told me that they had seen quite successful rootwork, so I engaged the gardener, and, finding that he answered to description, gave him a free hand. A number of good-sized Spanish Chestnut and Oak trees had been cut down near us some years ago. We had the roots of these grubbed up, and found that the softer parts had perished, leaving the hard cores. With them the rootwork was built, and with its bark it was about 104 feet long, 23 feet broad in its widest part, 9 feet in its narrowest, and 6 feet high at its highest. The noisome fungus did trouble, but we dug it out carefully, and after a time saw no more of it. Slugs and snails were rather troublesome, but that they sometimes are where there is no rootwork. A good many Laurels had been planted to grow up and hide the fence, and also Euonymus, Box, and small trees. Fat Tommy, a fine cat known in the neighbourhood, and figured in your paper, lived for thirteen years in a tub running up and down, with a ring on a wire, to scare the birds from rare plants. Owing to other more pressing gardening work, the rootwork was neglected, and many Ferns took possession to the injury of other plants. Some of the earlier imported Azalea mollis, Abelia rupestris, Berberis stenophylla, Azalea amœna, and other small shrubs, made the rootwork pretty in spite of its being over-grown. Taking the hint from the success of the shrubs, we next made a small rootwork at our cottage-garden near, planting Osmanthus of all sorts, Skimmias,

the more tender Spiræas, Clematis, climbing Roses, &c.; this has a pretty effect, and the shrubs have thriven wonderfully. Our old rootwork here was next taken in hand, and, having a gardener who does not mind the trouble of snail and slug hunting, we grubbed up the laurels, all but a few of the ornamental trees, and all the Ferns, put in fresh soil among the roots, made a large bed of good soil on the level at the top, and planted all manner of alpine and herbaceous plants and small shrubs, our object being to show what a great number of plants can be grown in a small space—an answer to friends who say that their gardens are too small to do much in. So far the remodeled rootwork is a complete success, and much prettier (looking like a wild bank) than any rockwork of the same size that I have seen, the black old roots, most of them still quite sound, setting off the plants. At the bottom of the rootwork there is a bed of good loam full of fine Primroses, and in the bottom bays such plants as Ramondia pyrenaica, Shortia galacifolia, Cyclamens, Colechicum speciosum, Illecebros, Meconopsis Wallichii, Galax apophylla, Pulsatilla, &c. At one end of the rootwork is a bed in which slabs of stone are sunk with plants against and amongst them, and at the east end a quantity of burr-work, so as to try the different shelters close to each other. *George F. Wilson.*

BORAX AS A PREVENTIVE OF MILDEW, ETC.—In your issue of October 22 (p. 497) reference is made to Mons. J. Morel's experiments with borax and boric acid, and their effects on vegetation and fungi, and a hope is held out that they may become useful agents in checking, or completely subduing mildew. As I have had some experience with borax as a mildew annihilator, perhaps a few lines giving the results attendant on its use may interest some readers of the *Gardeners' Chronicle*. About ten years ago, I had to deal with a very bad case of mildew on Vines, and as I was a new-comer at the place, I determined to subdue it, if possible, and having previously used borax with good effect on Roses, I concluded that its application to the Vines was likely to produce the same result. I found, however, that although I could kill all the fungoid growth visible on leaves and stems by syringing them with tepid soft water containing three-quarters of an ounce of borax to the gallon, and washing it off with clean water before it got time to dry, yet in a fortnight the places which were silted before this solution was applied were as bad as ever. This led me to the conclusion that only the mildew on the external portions of the plants were killed, the mildew spores which had pierced the tissues remaining quite healthy. In order to still further test the efficacy of borax as an anti-mildew specific, I again syringed a portion of one of the Vines, and allowed it to remain, but this dose proved worse than the disease, for every leaf thus bedewed was quickly killed. I may add that, by frequent experiments previous to these, I found that a weaker solution of borax than the one given above proved ineffectual, and when used at a greater strength injury was done to the foliage. Nevertheless, in spite of the injurious action of borax on leaves, it might be of service in preventing fungoid growth within the soil, and thereby prove a preventive to the Potato disease. During the last seven years I have been experimenting with sulphate of iron, with a view to ameliorate this evil, if not to entirely overcome it, and so far results have been most encouraging. As this compound is a manure, which sulphate of copper is not, I am inclined to believe it will become more extensively used when its inimical influence on fungi-germs are better known. It is not a manure, however, to apply indiscriminately, as it is powerful, and more harm than good will follow a too free hand in its use. To anyone situated in low-lying districts, I would say—try this chemical on your Potato-land before the haulm shows itself above-ground, and compare the crops obtained from an equal space of "dressed" and undressed ground, noting both the quantities and the effects of disease on each. *R. C. H.*

RIVERS' LATE ORANGE PLUM.—I was much amused on reading the lament of a member of the *Gardeners' Chronicle* staff that he could not find evidences beyond an empty plate of this Plum at the recent meeting at the Drill Hall. It is not fair to the press that good things—especially those which receive Certificates of Merit—should in this way disappear; but in this case only half-a-dozen fruits were shown, and these barely sufficed to allow the members of the Fruit Committee to get a taste. Perhaps it may be as well in the future to

insist upon a sufficient number of fruits for tasting should be furnished. The Plum in question was just about the size and form of an ordinary Green Gage, of a deep yellow colour, but a severe clingstone. The flavour was very much that of Coe's Golden Drop. That it was presented so late naturally led to its receiving a Certificate; still, it would be interesting to learn under what conditions the fruits were produced, and kept so long from harm. *A. D.*

CHRYSANTHEMUMS AND ASPHALTED PATHS.—Respecting the question asked in last week's *Gardeners' Chronicle* about Chrysanthemums being injured by being grown upon asphalted paths, I may mention that we have for years grown our plants upon the sides of walks of this description, and have not seen the least appearance of injury arising therefrom, and anyone seeing our house of Chrysanthemums at the present time would be convinced that they had not suffered from any cause. The walks are composed of tar and ashes, with enough spar to tone the colour, and a slight bed of ashes is placed beneath the pots in order to keep them level. We have also grown Strawberries successfully in a similar manner, but perhaps I ought to say we have not placed plants of any kind upon newly-made paths of this description, and if we had, we might have quite a different tale to tell. Were your correspondent's paths freshly made when the plants were placed upon them? *Thomas Coomber.*

RAINFALL IN NORTH WALES.—It may be of interest to your readers to know what the amount of rainfall here has been for the past month of October, it having been exceptionally large, viz., 44 inches. *J. Barnard, Mostyn Hall Gardens.*

DUPPLIN CASTLE.—I have to thank "Vagabond" very much for his addenda to my notes on a visit on Dupplin. Intelligence so kindly supplemented is very appreciative. When I made my hurried visit to that fine place, I was under pressing circumstances, with something like two hours in which to walk from the railway station (Forteviot), and back. To parade such extensive grounds was impossible. Had I sent to press half the knowledge I carried in my cranium from Dupplin, it would have filled more than a page of the *Gardeners' Chronicle*. I therefore touched on the chief cultural objects—which is always most acceptable to practical men. The historical lore of this place is very varied and ancient; even centuries prior to the stated period when the forebears of the present noble proprietor turned the tide of war with flails, and when the leader was resting he exclaimed, "O'hech hay," and the prompt rejoinder was, "and Hay thou shalt be called." Perthshire is pre-eminently in the van with Scottish seats, rich in landscapes and arboricultural treasures, and I hope to make a second visit to Dupplin and enjoy its park beauties along with friend Browning, as a lover of landscapes ought to. I made the attempt some years ago, but got engrossed so much in the attractions of Invermay (not Inverary, as stated at p. 525), and other fine seats, that after walking from Perth to Forgandean to ford the river in early morn, I had the disappointment of not getting near Dupplin till late at night, and passed on footsore to my hotel at Perth, which I reached about midnight—vagabond like. I do not stand at trifles when fine gardens and fine landscapes are to be reached. *M. Temple.*

PLATANUS ORIENTALIS.—I lately saw a magnificent specimen of this at Barn Elms, Barne, Surrey. This tree, which is perhaps one of the finest, if not the finest, in the country, is 100 feet in height, with a girth of 20 feet at 4 feet 6 inches from the ground. Barn Elms is about 100 acres in extent, and is rich in trees and historical interest. *B.*

PEARS.—It is interesting to note the effects of tree-lifting and judicious root-pruning, a practice too often done with undue severity. When the roots of trees are deeply embedded in cold damp ground, they are very liable to crack, and in cold districts they ripen very imperfectly, while the flavour of fruit from such trees is very inferior. Preparation for lifting may be done the previous season by cutting round the roots, which causes an abundant growth of fibre, thus preparing the tree for its removal and replanting, which should be to the level of surrounding soil. Then sun and air can do their beneficial work. Taking note of some Pear

trees on low walls which did not ripen their fruit till we root-pruned them during the growing season in early summer, they have, even in an untoward season like the present, produced fine fruit of good quality. Some Marie Louise are equal to what we often have seen in South and Mid England. We have always observed that when a barrier to the descent of top-roots was made at planting time (by a quantity of brick and lime-rubbish made firm at the bottom), the trees grow clean and healthy, and the fruit is decidedly superior to that where trees root deeply. *M. T.*

NEPENTHES.—In some remarks in the *Gardeners' Chronicle* of last week upon *Nepenthes* (p. 561), exhibited by Messrs. Veitch & Sons, the name *Northisi* is stated to have been applied to a new hybrid *Nepenthes* (*Northiana* × *Curtisi*). Allow me to enter my humble protest against such a name as *N. Northisi* × ever being registered in *Nepenthes* nomenclature; the ending of specific names in "i," "iana," and "æ," have a recognised and well-known botanical meaning, which the above custom would tend to destroy or render nugatory. It is also requested in the remarks that the hybrid × must always be added. This is often also illusory, as in the same article, amongst a list of names, I notice *N. Hookeriana* ×, with the × at the end of its name; now the species recognised in gardens under this name is not a hybrid, nor is it only a variety, as some would have us believe, but a very distinct species, and if it had its proper name, would be called *N. Rafflesiana*, Jack., which name horticulturally it has accidentally been deprived of; this is figured on p. 553 of last week's *Gardeners' Chronicle* as *N. Hookeriana*. The hybrid *N. Hookeræ* × is a different plant, also known as *N. anerleyense* ×, and probably the *N. superba* × (*Fl. Mag.*, t. 434) introduced some years ago by the General Horticultural Company. The first Pitcher-plant with which European botanists became acquainted was a model of nomenclature, alluded to often by the late Sir Wm. Hooker. The "*Planta mirabilis distillatoria*" of Grignon certainly was a miraculous distilling plant. In 1840, Sir Wm. Hooker says:—"The word distillatoria, it will immediately be perceived, implies the secretion and concentration of the fluid in the pitcher. Thus, we see how admirably are the names of plants calculated in many cases to characterise some property residing in the plant itself, or to impress some portion of its history on our minds." Of course, your readers recognise in this plant the *N. distillatoria* of Ceylon. *W. Etherington Dixon, Assoc. Bot. Soc. Edin.*

THE FROST.—It would be interesting to learn what the temperature was during the past month of October. Evidently it is seldom that such severe frost is experienced so early in the season. We are assured on all hands that (in Scotland at least) we have no record of such low temperature so early in the season. On October 23 our lowest reading was 13° of frost; but I have been told that in other parts of Stirlingshire 18° of frost were registered. *M. T.*

NURSERY NOTES.

MESSRS. E. D. SHUTTLEWORTH AND CO., LIMITED.

This firm, which was formed into a limited liability company some two years ago, is about increasing the house accommodation at the Albert Nurseries, Peckham Rye, London, S.E., and now that the land taken up by the firm at Fleet in Hants has been got well under, and is proving exceedingly suitable for the cultivation of Roses, herbaceous plants, and many kinds of bulbs, it is intended that the London nursery shall be used only for samples of such plants, and that most of the land available for houses shall be devoted to this purpose, where large batches of Cycads, Palms, Ferns, and other plants, principally foliage, can be propagated for wholesale trade.

When visiting Peckham Rye a short time ago, we found the houses very well stocked with thousands of Palms and other things just ready for sale to the trade. These Palms can either be bought just after the first leaves are made, in

bundles before ever being potted, or they can be had in pots in different sizes. All the Palms, young and old, were looking fresh and healthy, and perfectly clean. Of course, as they are intended for the trade, the principal kinds present in any quantity are the different species of *Areca*, *Kentia*, and *Cocos*.

The finest feature of the place is, no doubt, the rare and wonderfully fine collection of Cycads, in two of the houses. These range from small and highly useful plants, in 7-inch pots up to large specimens, and all present the most healthy appearance, and are perfectly clean in every respect.

A large batch of *Dracæna Lindenii* is looking well, but not quite so well-coloured as it may be seen sometimes. Crotons are in considerable variety, but it is intended to increase both the stock and the collection as soon as possible; at present there are about fifty varieties catalogued. Some hundreds of young plants of *Gardenia* are looking first-rate, being of a bushy habit, and bearing healthy, deeply-coloured leaves.

Asparagus plumosus is also well represented by a good number of healthy, useful-looking plants, and not far from these are a few hundreds of useful plants of *Grevillea robusta*, in 6-inch pots. *Chrysanthemums* have not been grown to any extent, but it is intended to take up their culture as soon as more accommodation is ready for housing the same. One or two houses are devoted to Orchids, and a number of the more popular species are to be seen here. We noticed two or three nice pieces of *Vanda Kimballiana*, and there was a varied and miscellaneous collection of *Cattleyas*, *Cypripediums*, *Dendrobiums*, &c. Other plants such as *Callas*, Ferns in different species, *Azaleas*, &c., are being well done, and in more or less quantity are ready for the trade. The stock of herbaceous plants at Fleet is being rapidly increased, with a view to making it as complete as possible, and a good number of the more useful species, as well as many rare varieties, are already catalogued. Pinks, Carnations, and Picotees are said to be doing well, and it is thought that the firm will hereafter be able to make a specialty of them. Most of the houses at Peckham Rye are low span-roofed, something like 100 feet long by 18 feet wide, and the addition of three other such houses will give room for raising a very much larger supply of Palms and other such things than has yet been done.

SOCIETIES.

ROYAL HORTICULTURAL Scientific Committee.

NOVEMBER 3.—Present: Dr. M. T. Masters in the chair, Mr. Morris, Mr. McLachlan, Dr. Russell, Dr. Muller, Rev. W. Wilks, Prof. F. Oliver, Dr. Scott, Prof. Church, Dr. Bonavia, Rev. G. Henslow, Hon. Sec.

Injuries to Plants by Fog.—Dr. Russell observed that, with reference to carrying out any experiments, the subject must be regarded from two points of view; firstly, the object would be to make an exhaustive investigation into the action of fogs upon plants. This, to a considerable extent, the Scientific Committee has already done, as shown in Professor Oliver's published report, and in a second upon which he is now engaged. Secondly, taking a wider aspect of the subject, the points which would have to be considered would be the composition of fogs in general, their origin and extent, their comparative densities, the amount of sulphurous acid, the consequent diminution of light, &c. Such investigations would lead to the more universally important consideration as to the increasing unhealthiness of London in winter. To carry out this extensive programme would necessitate the selecting several stations, involving continuous observations, both during fogs and in clear weather. The whole would require a staff of paid analysts. Dr. Russell then gave some interesting statistics of observations carried out at Manchester by Dr. Bailey, which will in due time be published. One point to which he alluded may be here mentioned—namely, the amount of chlorides contained in "fog collections" washed out of the air. He himself had found a dense precipitate of chlorides even on Dartmoor,

whenever sea breezes blew in that direction. *Apropos* of this, Professor Church remarked that he had on one occasion detected 7 grs. of salt per gallon at Cirencester, which was about 35 miles from the sea. It is evident, then, that the presence of chlorides do not necessarily always indicate the presence of sewage. Professor F. Oliver observed that, regarding the injuries from a horticultural point of view, the question as to the best means of preventing the action of fogs was most important. He described three methods. The first, with which he was very favourably impressed as to its efficiency, although it would probably prove to be the most difficult and expensive, was as follows:—The primary condition for success is that the plant-house must be air-tight. As glasshouses, however, are usually and purposely constructed with air-spaces beneath the overlapping glasses, these would have to be stopped up. In a house properly constructed, like that erected by Mr. Toope, the external air entered below, and was passed through boxes containing charcoal. A draught is created by the heated air of the house, which escapes at the top by means of exhaust caps, which allow of the passage of air from but not into the house. No sulphurous acid whatever then succeeded in passing through the carbon into the house, the filtration appearing to be perfect. A second method suggested was by means of sprays of various kinds, and by sprinkling the floors, &c. This method has its disadvantages, and Professor Oliver did not express a favourable opinion of it. The third plan is simply to spread canvas over the house during the period of the fog to prevent its passing into the cracks and into the house. Of course, the stoppage of light might be, in some circumstances, a serious objection, but not greater than that occasioned by the fog itself. The really injurious element of fogs is undoubtedly the sulphurous acid-gas, and this has to be especially combated. A discussion followed as to what steps should be taken by the Society in the matter. It was generally felt that, as far as the Scientific Committee were concerned, they could not do more than undertake the first object mentioned by Dr. Russell; and this has, in fact, been done. The second and wider object, however, is more or less directly concerned with the former, though it may have a much wider scope. It was proposed, therefore, to make a statement as to what the Royal Horticultural Society has already done in the matter, and to invite the co-operation and assistance of other societies, such as the Meteorological; finally, to appeal to the County Council to take steps towards carrying out a more extensive investigation than the Society alone could possibly accomplish.

Termes lucifugus.—Mr. McLachlan corrected an error in the description of the white ant of La Rochelle, as to the size of the larvæ, in that they are really smaller than stated, being less than a quarter of an inch in length.

Artichoke Galls.—He also exhibited a specimen of this disease on the Oak, alluded to at a previous meeting. It is produced by *Aphilotrix fecundatrix*, of which the agamic generation is known as *Andricus noduli*.

Calanthe Allonga Tubers.—Mr. Morris stated that the tubers exhibited by him at a meeting in June, 1891, and supposed to be of a species of *Kæmperia*, now proved to be derived from the above-named plant, an old Carib food plant. The description and chemical constitution ascertained by Professor Church will be found in the *Journal of the Royal Horticultural Society*, 1891, pp. lix. and cviii.

Conifers.—Dr. Masters exhibited a branch of *Pinus pinaster* with erect cones instead of their being reversed. He mentioned that he had once noticed a similar occurrence in the Scotch Fir at Zermatt, Switzerland. The former had been described as a new species with the name *Lemoniana*; but it merely represented a retention of the youngest condition of the cone. *P. ponderosa*.—He showed cones of this tree, which are peculiar in having the scales deciduous from below upwards, as occurs in *Abies*. *Pinus excelsa*.—He also exhibited a branching cone of this tree.

Pyrus japonica, fruit.—Mr. Read sent Apple-like fruits of this plant, remarkable for their large size, being 7 inches in circumference and $2\frac{1}{2}$ in height, and very symmetrical in form. They were grown against a sunny wall in Ealing.

The "Glassiness" Apple.—A specimen of this translucent Apple was sent from Naples by M. D. Piperio, where it is considered one of the best eating Apples in Italy. Professor Ward examined and described it on a previous occasion. (*Journ. Roy. Hort. Soc.*, vol. xii., 1890, p. clxvi.)

NATIONAL CHRYSANTHEMUM.

CHRYSANTHEMUMS.—This large annual gathering of the south country growers was held, as usual, in the Royal Aquarium, Westminster, on Tuesday, November 8, and two following days. The place was bright with groups and tables filled with Chrysanthemums, which were made the most of that the ill-adapted building would allow. It was generally admitted that the cut blooms, for general excellence, had never been excelled, although there was none extra large, nor any stand of them that could be said to greatly out-rival its fellows, as has occurred in most years. The beautiful Japanese varieties were enhanced by the presence of several fine novelties, and both plants in groups, and as trained specimens, were as good as could be.

THE SOCIETIES' COMPETITION.

This competition being open to all Chrysanthemum or horticultural Societies (affiliated or not), and the 1st prize consisting of a very handsome Trophy and £10, one would naturally expect this to be one of the most popular of the numerous classes offered in the schedule. However, the anxiety of different Societies to secure the award is not very general, or perhaps the growers prefer to exhibit their best specimens independently, and for themselves. The conditions imposed are, that there shall be twenty-four incurved blooms, in not less than eighteen varieties, and twenty-four Japanese, these latter to be distinct, and that all exhibits be the productions of *bona fide* members of the Society under whose auspices they are exhibited.

Although the entries were few, the quality of the 1st prize collection was of the best, and reflected the greatest credit upon the Society and upon its members from whose garden they came. Perhaps the Japanese were the strongest feature, but at the same time the incurved varieties were as good as we have ever seen shown in this class. St. Neot's Amateur and Cottage Horticultural Society, Huntingdonshire, who were placed 1st on Tuesday last, were 2nd in the competition last season, and the Society, which was successful then with a very fine collection indeed, are 2nd this year. The blooms comprising the successful collection on Tuesday were from the gardens of the Earl of Sandwich, and A. J. Thornhill, Esq. Havant Chrysanthemum Society were 2nd, and their display was very creditable.

CUT BLOOMS.

Incurved.—The general average of the incurved blooms was quite equal to that seen on other occasions, though it was feared that the lateness of the season would tell against this section particularly. The principal class was for thirty-six blooms, distinct, and the 1st prize consisted of the Challenge Cup and £10. As last year, Messrs. W. & G. Drover were the most successful, and were placed 1st for a very fine stand of blooms, almost of uniform merit. Perhaps the following were the best:—Jno. Lambert, Lord Alcester, Queen of England, Mr. S. Coleman, Alfred Salter, Jno. Doughty, Jeanne d'Arc, and M. R. Bahuant; the 2nd position was secured by Mr. W. G. Ray, nurseryman, Teynham, Kent, amongst whose exhibits was a very pretty specimen of Jeanne d'Arc; Lady Dorothy and Princess of Wales were also very fine. Mr. Chas. Gibson, gr. to J. Wormald, Esq., Mordan Park, Mitcham, Surrey, was 3rd.

In the class for twenty-four incurved blooms, Mr. Shoesmith, with a collection of first-class flowers, secured foremost position, particularly fine were John Lambert, Empress of India, Golden Empress, Madame Darier, Alfred Salter, Mrs. Coleman, Miss M. A. Haggas, Princess of Teck, Lady Dorothy, and Refulgens. The 2nd prize went to Mr. Ritchings, gr. to Dr. Frankland, Reigate Hill, closely following; and the 3rd to Mr. J. Myers, gr. to the Earl of Sandwich, Huntingdon.

For twelve incurved varieties, distinct, Mr. Arthur Ocock, gr. to Mrs. McIntosh, Havering Park, Romford, was 1st, with a creditable collection. The varieties were Lord Alcester, Lord Wolsely, Mr. S. Coleman, White Venus, Golden Empress, Miss Violet Tomlin, Empress of India, Princess of Wales, Golden Queen of England, Jeanne d'Arc, Miss M. A. Haggas, and Golden Eagle. Mr. W. Collins, gr. to J. W. Carline, Esq., Ponsbourne Park, Hertford, was a good 2nd; and Mr. G. Agate, Chrysanthemum Nursery, Havant, was 3rd. Mr. Jas. Myers, gr. to the Earl of Sand-

wich, Hinchbrook, Huntingdon, staged the best six incurved blooms, one variety only, the kind exhibited being Empress of India; Mr. Jno. Hewett, gr. to H. B. Mackeson, Esq., Hillside House, Hythe, was 2nd, with Princess of Wales, and with Jeanne d'Arc, Mr. Jno. McKenzie, gr. to F. S. W. Cornwallis, Esq., Linton Park, Maidstone, was placed 3rd.

Japanese.—The competition in these classes was keener than for those of the incurved varieties, and the quality generally better. Perhaps a better average of Japanese bloom has never been seen at this show. The principal class was for forty-eight blooms, distinct, and the 1st prize consisted of the Holmes Memorial Cup and £10. This was well won by Mr. W. Herbert Fowler, Claremont, Taunton, and the following is a full list of the varieties included in his stand:—Sunflower, Louis Bohmer, Vivian Morel, Lord Brooke, Avalanche, Ruth Cleveland, Puritan, Mr. D. B. Crane, Mrs. Alpheus Hardy, R. Brocklebank, Mons. Bernard, Eustard White, Baronne de Prailly, Madame Marie Hoste, Mr. E. Beckett, Boule d'Or, Hamlet, Mons. Freeman, W. Tricker, W. H. Lincoln, H. B. Ironside, Col. W. Smith, Mrs. W. H. Fowler, Lady T. Lawrence, Mrs. J. Clarke, Japonais, Aida, W. W. Coles, Glorioso, Mr. R. Williams, Stanstead White, Gloire du Rocher, Lilian B. Bird, Etoile de Lyon, Miss Hartshorn, Madame Baco, Mrs. E. D. Adams, Mrs. Falconer Jameson, Ethel Paule, Edwin Molyneux, Mr. A. H. Neve, Mrs. Jno. Lang, Florence Davis, Mr. G. Bryceson, and Coronet. The 2nd prize went to Mr. J. Myers, gr. to the Earl of Sandwich, Hinchbrook, Hunts, who was a thorough good 2nd, and included fine blooms of E. Molyneux, Florence Davis, and Louis Bohmer. 3rd, Messrs. W. & G. Drover, nurserymen, Fareham; and 4th, Mr. Charles Gibson.

In the class for twenty-four blooms, distinct, Mr. W. Herbert Fowler was again 1st, with blooms of much the same quality as in the larger class, and of the same varieties. Mr. Charles Ritchings, gr. to Dr. Frankland, The Yews, Reigate, was 2nd; and he, too, had very excellent specimens, especially might be mentioned Boule d'Or, Jeanne Delaux, W. Tricker, and Stanstead White; 3rd, Mr. C. Ling, gr. to E. P. Oakshott, Esq., Orchard Lane, Ealing; and 4th, Mr. Robt. Petfield, gr. to A. J. Thornhill, Esq., Diddington, Hunts.

Mr. A. Ocock, gr. to Mrs. McIntosh, Havering Park, Romford, secured 1st place in the class for twelve distinct blooms, with creditable specimens of Vivian Morel, Avalanche, Madame J. Laing, Florence Davis, Stanstead Surprise, Sunflower, Mrs. Falconer Jameson, W. H. Lincoln, Excelsior, Louis Bohmer, Gloire du Rocher, and M. A. Carrière; Mr. Trinder, gr. to Sir H. Mildmay, Dogmersfield Park, with an almost equal collection, was 2nd; and the 3rd place was taken by Mr. M. Harding, gr. to Mrs. Joad Patching, Worthing.

For six white blooms, one variety only, Mr. Jno. Hewett, gr. to H. B. Mackeson, Esq., Hillside House, Hythe, with Stanstead Surprise, secured leading place; and Mr. Charles Cox, gr. to Jno. Trotter, Esq., Brickendon Grange, Hertford, was 2nd, with Avalanche; Mr. M. Harding, who also showed Avalanche, was 3rd.

Japanese Incurved.—Mr. Robt. Petfield, as last year, was 1st for these (but instead of for twelve blooms, the class now only requires six). The varieties were Edwin Molyneux, Japonais, Empire, W. H. Lincoln, Boule d'Or, and Madame C. Audiguier. Mr. Howe, gr. to H. Tate, Esq., Park Hill, Streatham Common, was 2nd; and Mr. Harding 3rd.

Large-flowered Reflexed.—For twelve large reflexed blooms, Mr. Geo. Carpenter, gr. to Major Collis Browne, Broad Oaks, Byfleet, staged well-grown flowers of King of Crimson, Cloth of Gold, Chevalier Domage, Dr. Sharp, Pink Christine, Peach Christine, Cullingfordii, Mr. Forsyth, and Golden Christine; the 2nd position fell to Mr. Jas. Myers, and Mr. Chas. Brown, gr. to R. Henty, Esq., Langley House, Abbots Langley, was 3rd.

Large-flowered Anemones.—The best stand of twenty-four blooms came from Mr. A. Ives, gr. to E. C. Jukes, Esq., Hadley Lodge, Barnet; Mr. Jas. Myers was 2nd, and the 3rd position fell to Mr. R. C. Notcut, Broughton Road Nursery, Ipswich. These were all good.

Large Anemones.—For twelve large Anemone blooms (Japanese excluded), Mr. Ives again took leading honours with Empress, Mrs. Jules, Benedict, G. and Alvéole, D-laware, Gladys Spaulding, Lady Margaret, Marie Laglaiz, Cincinnati, W. G. Drover, Thorpe Junior, Nouvelle Alvéole, and Gück; Mr. R. C. Notcut was 2nd, and Mr. Chas.

White, 6, Garden Terrace, South Vincent Road, Southsea, was 3rd.

Japanese Anemones.—Again Mr. Ives was 1st for twelve distinct blooms in this section, being followed by Mr. R. C. Notcutt.

Anemone Pompons.—There appeared to be no competition in this class, but the exhibit of Mr. Jas. Myers was very meritorious. It included twelve varieties, and three flowers of each variety.

Pompons.—For twelve distinct varieties, three flowers of each to be shown in bunches with foliage, the 1st prize went to Mr. Chas. Brown, gr. to R. Henty, Esq., for very pretty and fresh looking flowers, including Miss Wheeler, Madame Elise Dordan, Madame Martha, Golden Madame Martha, Sunset, Black Douglas, Comte de Morny, and Prince of Orange. Mr. Jas. Myers was 2nd, and Mr. J. Agate, Chrysanthemum Nursery, Havant, 3rd.

Amateur Classes.—The conditions imposed here does not allow of any paid assistance whatever in the culture of the plants. For twenty-four Japanese blooms, Mr. H. G. Featherby, Bleak House, Gillingham, was 1st; Mr. Thos. Lansley, Pinner Road, Watford, 2nd; and Mr. Chas. White, Southsea, 3rd. The whole of these exhibits were highly satisfactory.

Mr. Jno. Horril, West Street, Havant, secured 1st for twelve distinct incurved blooms; Mr. Chas. White took 2nd place; and Mr. Thos. Lansley, 3rd. The competition was very keen between these and other exhibitors. Mr. Jno. Horril was again 1st for six incurved; Mr. George Walker, Wimbledon, 2nd; and Mr. F. Durrant, 4, New Road, Ware, 3rd.

For twelve Japanese blooms there were many entries, and Mr. Thos. Langley, who was 1st, staged a first-rate collection of blooms, including some of the newest varieties, and very well grown; Mr. F. Hicks, Elstree, Herts, was 2nd; and Mr. Chas. White, 3rd. In the class for six Japanese, Mr. F. Durrant was 1st; Mr. Jno. Horril, 2nd; and Mr. F. Hicks, 3rd.

Mr. Agate, Chrysanthemum Nursery, Havant, had the best twelve single-flowered blooms, bright, showy, large; and Mr. Wells, nurseryman, Earlswood, Surrey, had the second best. Good variety of colour and form was noticeable in these last.

AMATEUR AND SINGLE-HANDED GARDENERS' CLASSES.

For twelve incurved blooms, distinct, Mr. James Heath, gr. to M. Gurry, Esq., Abingdon Place, Newmarket, showed well, and secured 1st prize, whilst the 2nd and 3rd prizes went to Mr. Charles White, and to Mr. Charles Hudd, gr. to L. Lœffler, Esq., Kensington, respectively.

Mr. John Little, Hylands, Romford, was 1st for six incurved, followed by Mr. James Heath and Percy Waterer, Esq., The Briars, Longfield, Dartford, Kent.

The twelve Japanese class was an unusually strong one, and, consequently, competition was severe, at least, amongst the best stands. 1st, Mr. J. Heath, gr. to M. Gurry, Esq., Abingdon Place, Newmarket, whose finest blooms were E. Molyneux, Maiden's Blush, Puritan, Stanstead White, Vivand Morel, Sunflower, a very even, fine lot of bloom; Whickham Jones, Esq., Leicester (?) Lodge, South Norwood, was 2nd, with the following extra-fine varieties—Etoile de Lyon, Sunflower, and Puritan; 3rd, Percy Waterer, Esq., The Briars, Lingfield, Dartford, with excellent blooms, but rather small.

In the competition for six Japanese varieties, diverse, 1st, Mr. J. Heath, with flowers, the best of which figured also in the previously-named class; 2nd, E. Mawley, Esq., Rosebank, Great Berkhamsted, Etoile de Lyon, E. Molyneux, Val d'Andorre and Avalanche were very fine varieties; 3rd, Mr. W. Jones, gr. to W. Hooper, Esq., Glens Mount, Sutton, Surrey, with V. Morel, J. Delaux, and A. H. Neve.

METROPOLITAN CLASSES.

For twelve incurves, diverse, 1st, Frank Bingham, Esq., 6, Bethune Road, Stoke Newington, with excellent blooms of M. R. Bahuant, Lord Alcester, C. Flammarion, Lady Hardinge, Empress of India, and Refulgens, a not over large, but an even good stand; 2nd, Mr. F. E. Wright, gr. to G. Troup, Essex Lodge, Upper Clapton; his best were Prince of Wales, Lord Alcester, Lord Wolseley, and Prince Alfred. F. Bingham was the winner of the 1st prize in the next class, that for six incurved blooms, his Queen of England, John Doughty, Lord Alcester, J. Lambert, Empress of India, and A. Salter, were excellent; 2nd, Mr. W. Davey, gr., Cedar House, with fine blooms of Golden Empress, Lord Alcester, Violet Tomlin, &c.; 3rd, Mr. Wright. The last exhibitor was likewise 1st for twelve Japanese varieties, also for six; whilst F. Bingham, Esq., was 2nd.

TABLE DECORATIONS AND BOUQUETS.

These were of the usual kind—some of really good quality and arranged in perfect taste, others not particularly commendable either for tasteful idea or effective execution.

For three vases or epergnes, Mr. Seale, Vine Nursery, Sevenoaks, was 1st, with pretty exhibits. He was followed by Mr. Walter Mole, Hemel Hempstead; and Mr. R. Potter, gr. to Sir M. W. Collett, Bart., St. Clare, Harsing, Sevenoaks.

The principal class, however, in this group was for a table of bouquets, wreaths, &c., illustrating the decorative value of Chrysanthemums, and here a very light and tasteful arrangement secured 1st place for Mr. J. R. Chard, Stoke Newington; Messrs. Perkins & Sons, Coventry, were a very good 2nd; and Mr. H. O. Garford, florist, Stoke Newington, was 3rd.

Mr. R. Potter was 1st for two bouquets of Chrysanthemums; Mr. E. Chadwick, Brighton, 2nd; and Mr. C. Lye, gr. to Sir Spencer Wells, Hampstead, 3rd.

GROUPS (OPEN).

These had to cover, or at least not exceed, a space of 100 square feet, quality and general effect to be the leading features.

Here, Mr. Norman Davis, nurseryman, Camberwell, was placed 1st, and although the greater variety of high-coloured blooms in the next best group pleased the more superficial observers, Mr. Davis' plants were the more nicely-graded down to the floor, more regular as regarded the outline of the group as a whole, and it had few, if any, partially-developed blooms. White, pale pinks, and yellows were the predominating tints. Messrs. Reid & Bornemann, nurserymen, Sydenham, had the second best group, and, as we have said, they failed to secure the first place, for a few obvious reasons; Mr. Stevens, St. John's Nursery, Putney, was 3rd, a good full compact group, principally consisting, as did the others, of Japanese varieties.

Six trained specimens. These were particularly fine plants—large, well grown, full of bloom, yet not too full, and provided with a fair quantity of foliage. Moreover, the training was a little more free than was once the mode, certainly a much-to-be-desired improvement. 1st, Mr. D. Donald, gr., Leyton, with the varieties Christine, Dr. Sharp, Bertha Rendatler, Margot, and Gloire du Rocher, &c.; 2nd, Mr. T. Brook, gr. to W. Reynold, Esq., The Grove, Highgate, whose specimens of Chinaman, B. Rendatler, Bouquet Fait, and Avalanche were worthy of admiration; 3rd, Mr. Wesker, with good plants and fine bold blooms, a little thinly distributed.

For four trained specimens, 1st, Mr. R. Clarke, gr. to W. Griffiths, 41, Palace Road, Streatham, S.W., his varieties being Source d'Or, Margot, B. Rendatler, Mrs. G. Rundle, the second and third being very fine plants; 2nd, Mr. Gilks, gr. to W. E. Freer, Esq., Elm House, Walthamstow, with well-trained and grown plants of Elsie, Bouquet Fait, W. Robinson, and Dr. Sharp; Mr. W. Davey was 3rd; his specimen of W. Robinson was finely bloomed—a fine coppery-coloured, showy variety.

In the best six standard class, the 1st prize fell to Mr. D. Donald, gr. to J. G. Barclay, Esq., Leyton, Essex, for nice specimens of Anne Cleburn, Cleopatra, Stanstead Surprise, Chioaman, and Bertha Rendatler, all furnished with foliage, and not stily tied.

Mr. W. Davey, Cedar House, Stamford Hill, was 1st for four standards of Stanstead Surprise, B. Rendatler, Hes des Plaisirs, and Margot; 3rd, Mr. W. Wesker, gr. to A. Horn, Esq., Tooting Beeches, with densely flowered tall plants.

The six trained Pompon competition, brought neatly-trained, fair-sized specimens of Marie Stewart, Rosivante, Sœur Melanie, &c., from Mr. F. Gilks, who was awarded 1st place, the 2nd being taken by Mr. W. Davey, and the 3rd by Mr. Wesker, whose Eynsford Gem and Nellie Rainsford were very commendable varieties and plants.

One specimen Chrysanthemum of any type, 1st, Mr. F. Gilks, with Christine; 2nd, Mr. Davey, with Stanstead Surprise; and 3rd, Mr. Wesker, with Mrs. G. Rundle.

The 1st prize for twelve plants for the dinner-table was taken by Mr. John Macgregor, gr. to Dowager Lady Hay, North House, Putney Hill, whose well-grown little plants, fresh-looking, and in the best condition, consisted of Croton, Prince of Wales, and others, Pandanus Veitchi, Aralias, Palms such as Geonoma, &c.; 2nd, Mr. J. Myers, gr., Hinchinbrook House, Huntingdon.

Mr. Myers' prizes for three best blooms of a new incurved variety not yet in commerce, 1st, Mr. Robert Owen, Floral Nurseries, Castle Hill, Maidenhead, for Robert Petfield, an English seedling, a fine

compact bloom of good depth, and with a smooth petal of good width. The colour is light purple. This lady gave a prize for the best new Japanese, same conditions. This prize was taken by Mr. W. Seward, The Firs, Hanwell, for a large rich velvety-crimson reflexed variety of the finest proportions and quality.

Messrs. Pitcher and Manda's prizes for the three best new Chrysanthemums (plants) raised from their seed. 1st, Mr. W. Gilbert, gr. to B. Le Mere Foster, Esq., Sennow Hall, Norfolk. The varieties (Japanese) consisted of likely-looking flowers, of, respectively, a red, mauve, and yellow colour.

MISCELLANEOUS EXHIBITS.

These consisted largely of Chrysanthemums, either as cut blooms or plants, and added much interest to the show, as well as tending to relieve the somewhat shabby appearance of the building.

Messrs. Pitcher and Manda, Hextable, had a group of novelties, including their G. W. Childs, E. Molyneux × Cullingfordi. It is of a deep rich velvety crimson—a fine variety; W. A. Manda, a canary-yellow variety from America; Lord Brooke, certificated in 1891—a seedling of a creamy-white colour; Primrose League, and some of lesser merit. The rest of their exhibit consisted of foreign and home novelties, and a great quantity of cut bloom.

Mr. H. J. Jones, Rye-croft Nursery, Hither Green, S.E., exhibited the novelties, C. E. Shea, a yellow-coloured reflexed Japanese, a flower of much graciousness—the white sport from Louis Behmer, with its hairs. It is pretty as such flowers go. Mr. E. Rowbottom, another new variety, has volute incurved florets, of a bright yellow. It is a seedling Japanese of 1891. This exhibitor had a tableful of plants, mostly consisting of novel kinds.

In the incurved section was May Tomlin, deep rose; Mr. Robinson King, noticed elsewhere; a white Japanese, named Gaetan Guelli, globular in shape, with twisted florets; Mr. R. Leadbeater, in the same style, but yellow; Florence Davis, Marie Hoste, Hetty Dean, and others, found a place on his table.

Messrs. E. D. Shuttleworth & Co., 256, Peckham Rye, had a table of plants, consisting of Palms, Dracaenas, Cyclamens, grasses, Bambusa, Crotons, Heaths, &c., a capitally grown lot of small stuff.

Messrs. H. Cannell & Sons, Swanley, Kent, had a magnificent tableful of cut zonal Pelargonium blooms, with the finest of trusses and most delicate colours. Their exhibit of Cyclamen in flower was very good for the time of year, and their very extensive one of Chrysanthemum flowers, stuck into dark green moss wide enough apart for each to be seen all round, was a lesson in exhibiting. Among the many single-flowered varieties was one with thread-like rays, yellow, an elegant thing. The rest consisted of the best old and new varieties in most sections of Mums.

Many zonal Pelargoniums were shown by Mr. G. Burnett, gr. to Mrs. Fenton, The Grange, Hillingdon; and fine orchard-house Apples by Messrs. T. Rivers & Sons, Sawbridgeworth. Mr. Wright, gr., Middle Temple, showed some naturally grown plants of Miss Rose, a single-flowered variety, good as a market flower. The plants had a good deal of merit as decorative objects.

The horticultural trade was well represented, but space forbids us to say anything further.

Messrs. Williams & Son, Upper Holloway, had a group of foliage plants, Orchids, &c. Messrs. Reid & Bornemann, Sydenham, some seedling Chrysanthemums. Mr. W. Seward, The Firs, Hanwell, also seedling Chrysanthemums. Mr. Jas. Dibben, Wickham Park Nursery, Brockley, seedling Chrysanthemums. Also from Messrs. Pearson & Sons, Chilwell, Notts; Mr. Chas. Black, Warren Garden, Hayes Common; Messrs. Carter & Co., Barnet; and Mr. A. Ives, Hadley Lodge. Good bunches of Gros Maroc Grapes came from Mr. Wm. Allau, Gunton Park Gardens, Tomatos from Mr. Geo. Featherly, The Nurseries, Gillingham. A collection of Apples from Messrs. Cutbush & Son, Highgate; also a collection of Heaths and foliage plants. Collections of Apples from Messrs. John Laing & Sons, Forest Hill, and from Messrs. J. Cheal & Sons, Crawley; also a number of cider and other Apples from Messrs. Gaymer & Sons, cider makers, Barham, Attenborough. Mr. W. Brown, florist, Richmond, exhibited tasteful wreaths and crosses. Mr. A. Newell, gr. to Sir Elwin Saunders, Fairlawn, Wimbledon, a table composed of foliage plants and banded plants. Mr. Jas. F. McLeod, gr. to J. Pierpoint Morgau, Esq., Dover House, Roehampton, a group of well-flowered Bouvardias; and Mr. Charles Brugzemann, Ville Franche-sur-Mer, some sprays of Chrysanthemum frutescens.

FRUIT AND VEGETABLES.

The show of fruit was a little more extensive than that of last year, and the quality was good, especially in the Apple classes. Mr. Chas. Ross, gr. to Col. Archer, Eyre, Welford Park, Newbury, was 1st, for six dishes of dessert Apples; and Mr. Thos. Turton, gr. to J. Hargreave, Esq., Reading, 1st, for six dishes of culinary Apples.

The 1st prize for six dishes of dessert Pears went to Mr. Gen. Goldsmith, gr. to Sir E. Loder Bart., Leonards Lee, Floreham; and the 2nd to Mr. W. Allan, gr. to Lord Saffield, at Gunton Park, Norwich.

Mr. J. H. Ridgewell, Histon Road, Cambridge, took 1st place for six dishes of Potatoes.

Grapes were shown in some quantity, and of good merit. Mr. W. Harman, gr. to the Earl of Denbigh, Nunham Paddock, Lutterworth, was 1st for three bunches of white, with Muscat of Alexandria; the 2nd place went to Mr. C. Griffin, gr. to A. Christy, Esq., Coombe Bank, Kingston-on-Thames; and Mr. J. Bury, gr. to C. Bayer, Esq., Forest Hill, was 3rd.

For three bunches of black (other than Gros Colmar), the 1st prize went to Mr. Allan, for very fine and well-coloured bunches of Black Alicante; Mr. A. Ocock, gr. to Mrs. McIntosh, Romford, was 2nd; and Mr. Howe, gr. to Henry Tate, Esq., Park Hill, Streatham Common, 3rd.

For Gros Colmar, the 1st prize was obtained by Mr. J. Edmunds, gr. to the Duke of St. Albans, Bestwood Lodge, Notts; Mr. Geo. Elliott, gr. to P. N. Graham, Esq., Hurst Side, West Molesey, 2nd; and Mr. E. Tantz, 1, Queen's Walk, Ealing, 3rd. Mr. J. H. Ridgewell was 1st for nine dishes of Potatoes, offered by Messrs. Sutton & Sons, Reading; and Mr. T. Haine, gr. to the Hon. D. R. Bouverie, Colehill House, Highworth, 1st for four dishes.

The entries for the prize for a collection of vegetables offered by the same firm were numerous, and the excellence of the exhibits was frequently remarked. Mr. Charles Gibson, The Oaka garden, Carshalton, was 1st; Mr. R. Lye, gr. to W. H. Kingsmill, Esq., Newbury, 2nd; C. T. Waite, gr. to the Hon. W. P. Talbot, Glenhurst, 3rd; and Mr. Charles Brown, gr. to R. Henty, Esq., Abbots Langley, 3rd. Messrs. Webb & Sons, Wordsley, Stourbridge, also offered prizes for collections of six vegetables, and the winners in this class were Mr. C. T. Waite, 1st; Mr. W. Pope, gr. to the Earl of Carnarvon, Newbury, 2nd; and Mr. R. Lye, 3rd.

CERTIFICATES, &c.

The meeting of the Floral Committee took place at 3 o'clock in the Library, Mr. E. C. Jukes, presiding, there being, as is usual at the November meeting, a large number of new varieties. First-class Certificates of Merit were awarded to Messrs. J. R. Pearson & Sons, Chilwell Nurseries, Nottingham, for Japanese Edwin Lonsdale, a large and fine bright pale red Japanese, with a silvery reverse, broad-petalled and full. To Mr. W. Seward, The Firs, Hanwell, for Princess Victoria, a large and full creamy-blush Japanese of great promise; and to Charles Shrimpton, a bright pale red reflexed Japanese, promising to make a fine exhibition variety. To Mr. Charles Bick, The Gardens, The Warren, Hayes Common, Kent, for Charles Bick, a bold and striking yellow Japanese, something of the character of Boule d'Or, but paler in colour; very promising, and La Deul, a very fine large bright rosy-red Japanese Anemone, which will make a good exhibition variety. To Mr. R. Cawte, Brookleigh, Esher, for Brookleigh Gem, a sport from Jeanne d'Arc, of a deep pinkish-rose colour, that promises well for an incurved exhibition variety. To E. C. Shea, Esq., Fooks Cray, Kent, for Miss Dorothea Shea, a large pale red reflexed Japanese, with buff reverse. To Messrs. James Carter & Co., seed merchants, High Holborn, for Rosy Morn, a beautiful soft pink Japanese, reflexed, deep, and full. To Mr. R. Owen, nurseryman, Maidenhead, for Lucy Kendal, a fine purplish-red Japanese, rich in colour, and for incurved Robert Petfield, a very promising variety indeed, in the way of Lady Hardinge, of good colour, and broad florets. To Mr. J. Agate, nurseryman, Havant, for Princess May, a large white Japanese, with long tubular petals, a little thin as shown, but said to be very fine indeed in quality.

Japanese L'Enfant des Deux Mondes, a white sport, from Louis Boehmer; also Mr. J. Whittle, a deep blush, broad-petalled Japanese, like H. A. Neve; Mermaid, a broad-petalled white incurved Japanese; and Pearl, a fine petalled white incurved, from Messrs. J. R. Pearson & Sons the committee wished to see again. A bronzy sport from the Anemone-flowered Glück, from Mr. W. Kaye, Wor-

cester Park, Surrey, the committee wished to see again; and the same request was made in respect of Duke of York, promising incurved Japanese, deep red, with silvery reverse, of the build of Comte de Germiny, from Mr. J. Dibbens, Breakspear Road, Bickley.

Japanese Miss Maggie Blenkins, a chestnut-red Japanese, with yellow reverse, from C. E. Shea, Esq.; also Japanese Charles Herrin, a large pale incurved variety, cerise-red, with silvery reverse. All these were promising flowers, and will come before the committee again.

The *Gardeners' Magazine* Medal, for exhibits of superior merit, were awarded to Mr. Arthur Ocock, The Gardens, Havering, for his 1st prize twelve blooms of incurved Chrysanthemums in Class 5, and for his 1st prize twelve Japanese in Class 8.

WATFORD CHRYSANTHEMUM SHOW.

NOVEMBER 1, 2.—The seventh annual show of the Watford Chrysanthemum Society took place on the above dates in the Agricultural Hall, Watford.

The show was well attended, and was above the average in merit, the Chrysanthemums being quite up to former years.

In the centre of the hall was a fine feature in the decorations of the exhibition—a varied group sent by the president, the Earl of Clarendon (gr. Mr. Myers). The Earl of Essex, and several other gentlemen, also sent extensive and well-assorted groups.

The prize list shows that Mr. H. Hucks Gibbs, M.P., Aldenham House, Elstree, took the greater part of the prizes, including fourteen 1st, three 2nd, and three 3rd prizes (amongst them being the award given by the National Chrysanthemum Society for the best six Japanese blooms). His chief prizes in division 1 (open to all comers) were for the best miscellaneous group of horticultural plants, twenty-four incurved varieties, twenty-four Japanese varieties, twelve Japanese blooms distinct, and also for the best cut bloom in the show.

Mr. C. R. Humbert (the Hon. Sec.) was successful in gaining the Silver Cup, value £5 5s. given for the best group of Chrysanthemums in the division, open to the United Kingdom, also the Silver Medal awarded for the best exhibit in the show.

In division I, open to all comers, the 1st prize for six Primulas, in 6-inch pots, went to Mr. S. T. Holland; and the 2nd to Mr. G. Lake. In the same division Mr. T. F. Blackwell won 1st prize for best twelve Japanese blooms, one variety, Stanstead White. This exhibitor also carried off the 1st prize for twelve incurved varieties, and 2nd for six Japanese blooms.

The prize for the best collection of vegetables was secured by Mr. T. F. Halsey, M.P.; the 2nd going to Mr. G. W. Williams. The former also secured 2nd prize for best collection of fruit.

The Piece of Plate, value £3 3s. (offered by Mr. W. Horton), to members, for the best group of Chrysanthemums, was won by Mr. W. B. Hawkins. The other chief prize-winners for groups were the Hon. R. Capell and Mr. C. J. Beer.

Mr. A. Scrivener again this year took the chief prizes for wreaths, crosses, &c.; whilst Mr. R. Henty gained three 1st prizes for cut blooms, for members, and the 1st prize for vegetables.

The other 1st prizes for vegetables were taken by the Rev. H. F. H. Barchell Heroe and Mr. James Fox. The value of the prizes amounted to £140.

PORTSMOUTH CHRYSANTHEMUM.

NOVEMBER 1, 2.—A very fine exhibition was held in Portsmouth Drill Hall, notwithstanding that there was a falling off in some of the classes, as we notice in most shows this year, owing to the unfavourable weather at the end of the summer; still, the display on the whole, in the cut-bloom division, was a very fine one, no less than 1200 blooms being staged, exclusive of Pompons, or single-flowered varieties. There was a wonderful display of hardy fruit, Grapes, and vegetables, such as has not before been seen in Portsmouth. Groups of Chrysanthemums were arranged at the sides of the Hall, with good effect. Mr. Hatch, gr., Victoria Park, won the 1st prize with a solid bank of bloom; Mr. Hunt, gr. to Sir W. Pink, Shrover Hall, Cosham, was 2nd.

Prizes were offered for a group of Chrysanthemums arranged with foliage plants—a commendable class. Here J. Burridge, North End Nursery, Portsmouth, won the 1st prize easily.

Plants for table decoration made a fine display. Mr. Ams, gr. to the Hon. Mrs. Elliott Yorke, Hamble Cliff, Netley, was 1st for twelve.

Double Primulas were excellently shown by Mr. Hatch, who was awarded 1st prize in the class for those plants.

Specimen plants do not call for comment, these being poorly represented.

Cut Blooms.—For forty-eight and thirty-six half incurved and half Japanese varieties, Mr. N. Molyneux, gr. to J. C. Garnier, Esq., Rooksbury Park, Fareham, was an easy 1st with solid medium-sized Japanese and well-finished incurved. Two of his varieties, viz., Princess May, a seedling white Japanese, with long narrow drooping florets, and the incurved Mrs. Mitchell, a buff coloured sport from Empress Eugénie, seem to be of great promise. There were five competitors. Mr. Neville, gr. to F. N. Flight, Esq., Twyford, was placed 2nd.

In the class for twenty-four distinct half-incurved and half-Japanese, Mr. Inglefield, gr. to Sir J. Kelk, Bt., Tedworth, Marlborough, was 1st with heavy blooms, and Mr. N. Molyneux, 2nd.

Japanese in twelve varieties were best staged by Mr. Agate, of the Chrysanthemum Nurseries, Havant; Mr. Hawkins, gr. to E. Laphorne, Esq., Gosport, being 2nd. Six competed. Mr. Hawkins was 1st for twelve incurved varieties; Mr. C. Steptoe, gr. to G. A. Gale, Esq., Horndean, was 2nd.

Reflexed varieties were best shown by Mr. H. Adams, gr. to T. S. Edgcombe, Hinton House, Southsea; Mr. Penford, gr. to Sir E. Fitz-Wygram, Bart., M.P., Leigh Park, Havant, being in the 2nd place.

Anemone-flowered varieties were staged best by the last-named exhibitor in the class for twelve, and Mr. Steptoe was 2nd. Mr. Hunt was 1st, for six incurved of any one variety, with neat examples of Princess of Wales; while Mr. N. Molyneux took a similar award for six of any one Japanese variety with solid blooms of Avalanche.

Pompons were a bright display, the best twelve bunches coming from Mr. Hatch; Mr. Agate being 2nd; but who, however, turned the tables on his opponent in the class for the same number of single-flowered varieties. Mr. Wells, Earlsfield Nurseries, Earlswood, Redhill, was 2nd. Mr. Hatch was 1st for fringed varieties in bunches of three. The premier incurved bloom in the show was a full, richly-coloured Golden Empress, shown by Mr. Inglefield; and Mr. Agate, with Stanstead White, won in the Japanese section.

Messrs. Perkins, Coventry, had the best Chrysanthemum bouquet; and Mrs. Conway, Havant, was unapproachable for the best arranged epergne, table decoration, and a vase of foliage and berries.

ASCOT CHRYSANTHEMUM.

NOVEMBER 2, 3.—At this exhibition, the groups of Chrysanthemums have for some years become a notable feature, and this occasion was not an exception, for nowhere else have we seen better groups; and, considering that the season has not been propitious to the grower, the results achieved were the more remarkable. In the class for the largest grower, Mr. Cowie, gr. to Kere L. Oliver, Esq., Whitmore Lodge, was easily 1st, with plants which were about 2 feet high in the front of the group, gradually increasing in height to the back, and the flowers and the arrangement of the plants were very good. Mr. May, gr. to Lady Isabella Krane, Sunningdale, was 2nd. In the smaller class, Mr. H. White, gr. to the Marchioness of Conyngham, Ascot, won the premier award without difficulty.

Groups of miscellaneous plants were largely shown, and tastefully arranged. Mr. Thorne, gr. to Major Joicey, Sunningdale Park, was 1st, with a very prettily-arranged table. Cyclamens, Chinese Primulas, and Solanums were also well shown, especially the first named.

Cut blooms were present in large numbers, and of good average quality. The principal class, that for thirty-six (i.e., eighteen incurved and Japanese varieties), distinct, for which a silver cup was offered; Mr. Page, gr. to H. P. Leschallas, Esq., Bagshot, was rather easily 1st, his blooms being very good. Mr. Sayre, gr. to Miss J. Dunning Smith, Ascot, was 2nd. These same exhibitors occupied similar positions in the class for twenty-four incurved, showing fairly good blooms.

Mr. Popple, gr. to the Hon. Lady Cowell Stepney, Wood End, was 1st for twelve incurved varieties; and Mr. Edge, gr. to Lord Harlech, Tetworth, was 2nd.

Mr. Woodhouse, gr. to Miss H. Belcher, Spring Grove, had the best six distinct varieties. For twelve Japanese, Mr. Cowie was successful, with

even, heavy blooms, well set up; Mr. Popple being 1st for six Japanese.

Reflexed varieties seem to have received a good deal of encouragement here; and for twelve distinct varieties Mr. May was an easy 1st, with richly-coloured flowers of moderate size; and Mr. Cole was 2nd. Mr. Joy, gr. to Mrs. Entwistle, Sunninghill, was the winner for the best six blooms of any one of the Queen section, with full, solid flowers of Empress of India; and Mr. Page was 2nd. The variety Avalanche won 1st and 2nd prizes for six of any one variety of Japanese, Mr. Page and Mr. Thorne being the winning exhibitors.

Mr. Joy was 1st for any Japanese variety, excluding white varieties, with E. Molyneux; and Mr. Page was 2nd, with Viviani Morel.

A class had been provided for twelve blooms to be put up with not less than 9 inches of stem above the board, Mr. Lane here winning easily.

The premier incurved flower in the show was one of Madame Darrier; as was one of Viviani Morel, in the best Japanese.

BOLTON CHRYSANTHEMUM.

NOVEMBER 4, 5.—The sixth annual exhibition in connection with the Bolton Horticultural and Chrysanthemum Society was held in the Town Hall last Friday and Saturday, and was visited by an exceptionally large number of people, over 900 paying for admission between the hours of seven to nine on the closing night. The judges were unanimous in declaring the exhibits, taken altogether, as the best they have seen this year. There were 38 exhibitors, and 157 entries. The 1st prize for group of Chrysanthemum plants, and the Society's Bronze Medal, was awarded to Mrs. J. K. Cross (gr., Walter Wainwright), and the 2nd fell to Mr. J. W. Makant, J.P. (gr., Henry Shone).

In section I, for a group of miscellaneous plants arranged for effect, the 1st prize fell to Mr. John Heywood, J.P., The Pike (gr., George Pawson); and the 2nd to Mr. Martin Musgrove, J.P. (gr., F. Pownall). In other classes, the principal prize-takers were Mrs. Haslam (gr., James Hicke), A. Heine (gr., Joo. Cragg), and Mrs. Shaw (gr., Chas. Jones).

PRESTON AND FULWOOD HORTICULTURAL.

NOVEMBER 5.—What was considered the most successful meeting of the year in connection with this Society was held on Saturday at the Preston Town Hall, and in honour of His Worship the Mayor, who is President of the Society, a specially attractive exhibition of plants and fruits was held in the Guildhall. The contributors included most of the best growers in and around Preston, and the exhibition was worthy of the occasion. The Society offered prizes for special productions, and the following were the principal awards:—First-class Certificate—Wm. Troughton, for varieties of Onions, Apples, and Potatos; S. H. Scott, The Lindens, for a bowl of hybrid Roses; Lord Latham, for a dish of twelve Potatos; Miss Farington, Tomatos; W. Troughton, six table plants, distinct; H. E. Page, twelve Japanese Chrysanthemums; and another for two bunches of black Grapes. In the open prizes, Wm. Troughton secured 1st, with Apples; and Lee Campbell (Herefordshire), was awarded 2nd. On Saturday evening a paper was read by Mr. Hathaway, gr. to Lord Latham, he having for his subject, "The Tomato." The Mayor presided.

MARKETS.

COVENT GARDEN, November 10.

[We cannot accept any editorial responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they fluctuate, not only from day to day, but often several times in one day. Ed.]

MARKET quiet. Prices unaltered. James Webber, Wholesale Apple Market.

SEEDS.

LONDON: Nov. 9.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Road, Borough, London, S.E., report to-day's market somewhat bare of buyers. In American Red Clover Seed, which just now is the favoured article, the recent advance is well sustained. There is no change this week in either Alske White or Trefoil. Rye-grasses tend upwards. Winter Vetches are in short supply; a spell of fine weather would greatly improve the demand. Königsherg Tares being very cheap and good, attract increased attention. Canary seed is steady. Spot Hempseed, being remarkably scarce, is advancing in price. Peas and Haricots are firm. Buckwheat, Zari, Millet, and Linseed, show no alteration. The Board of Trade returns give the imports of Clover and grass seeds into the United Kingdom for the last ten months of this year, as cwt. 228,259, value £488,590, as against cwt. 189,873, value £391,453, for the corresponding period of 1891.

FRUITS AND VEGETABLES.

SPITALFIELDS: Nov. 8.—Quotations:—Cauliflowers, 2s. 6d. to 6s.; Savoys, 2s. 6d. to 6s.; Cabbages, 2s. 6d. to 4s. per tally; Brussels Sprouts, 1s. 6d. to 2s. per half-sieve; Spinach, 1s. to 1s. 6d. per bushel; Seakale, 6d. to 9d. per punnet; Greens, 1s. 6d. to 2s.; Turnips, 1s. 8d. to 2s.; Carrots, 1s. 6d. to 2s. 6d.; Parsley, 1s. 6d. to 2s. per dozen bunches; Parsnips, 4d. to 1s. per score; Beetroot, 1s. 6d. to 2s. per half-sieve; Horseradish, 1s. to 1s. 2d.; Celery, 4d. to 1s. per bundle; Cucumbers, frame, 1s. 6d. to 2s.; Leeks, 2s. to 2s. 6d.; Cabbage Lettuce, 6d. to 8d.; Endive, 4d. to 8d. per dozen; Onions, English, 5s. 6d. to 6s. 6d. per cwt.; do., Spanish, 5s. 6d. to 6s. per case; do., Dutch, 4s. 9d. to 5s. 6d.; do., Belgian, 5s. to 5s. 6d. per bag of 110 lb.; Carrots, 25s. to 50s. per ton; Tomatos, English, 4s. to 5s. per peck; Pears, 2s. 6d. to 3s. 6d. per half-sieve; Apples, English, 2s. 6d. to 5s. 6d. per bushel; do., American, 10s. 6d. to 17s. 6d. per barrel.

STRATFORD, Nov. 8.—There has been an excellent supply of all kinds of produce at this market during the past week, and a brisk trade was done as under:—Cabbages, 3s. 6d. to 4s. 6d. per tally; Savoys, 3s. 6d. to 5s. do.; Greens, 1s. to 2s. 6d. per dozen; Cauliflowers, 1s. to 1s. 6d. do.; do., 4s. to 7s. per tally; Turnips, 1s. 6d. to 2s. per dozen bunches; do., 30s. to 40s. per ton; Carrots, household, 40s. to 50s. do.; do., cattle-feeding, 35s. to 40s. do.; Parsnips, 60s. to 70s. do.; Mangolds, 16s. to 20s. do.; Swedes, 20s. to 25s. do.; Onions, English, 6s. to 6s. 6d. per bag; do., Dutch, 4s. to 5s. do.; Apples, English, 2s. 6d. to 5s. per bushel; do., American, 12s. to 13s. per barrel.

BOROUGH: Nov. 8.—Quotations:—Cabbages, 3s. to 4s. 6d. per tally; Cauliflowers, 1s. to 1s. 9d. per dozen; Brussels Sprouts, 1s. 3d. to 2s. per half-sieve; Lettuce, 6d. to 1s. per score; Carrots, 2s. 6d.; Turnips, 1s. 6d.; Parsley, 1s. 6d. per dozen bunches; Onions, English, 6s. 6d.; do., Dutch,

5s. per cwt.; Horseradish, 2s. to 2s. 3d.; do., foreign, 1s. 6d. per bundle; Apples, English, 2s. 6d. to 10s. per bushel.

FARRINGTON: Nov. 10.—Quotations:—Tomatos, 3d. per lb.; Apples, American, 12s. to 15s. per barrel; King Pippins, 4s. 6d. per bushel; Wellingtons, 4s. do.; Wainuts, 4s. per peck; Grapes, 12s. to 15s. per box; Turnips, 2s. 6d. per bag; Onions, 5s. 6d. per cwt.; do., Spanish 6s. per case; Cabbage, 5s. per tally; Cauliflowers, 3s. 6d. to 4s. do.; Carrots, 50s. per ton.

POTATOS.

SPITALFIELDS: Nov. 8.—Quotations:—Bruce Magnums, 60s. to 65s.; Snowdrops, 60s. to 70s.; Reading Wonder, 50s. to 60s.; Hebrons, 50s. to 55s.; Imperators, 50s. to 60s.; Magnums, 50s. to 65s. per ton.

BOROUGH: Nov. 8.—Quotations:—English Magnums, 55s. to 65s.; Hebrons, 60s. to 65s.; Snowdrops, 60s. to 70s. per ton.

STRATFORD: Nov. 8.—Quotations:—Dark land, 50s. to 55s.; light land, 60s. to 65s.; Bruce Magnums, 70s. per ton.

FARRINGTON: Nov. 10.—Quotations:—Magnums, 60s. to 65s.; Snowdrops 70s.; Imperators, 65s. to 65s. per ton.

CORN.

Averages.—Official statement of the average prices of British corn, imperial measure (bushel) for the week ending November 5, and for the corresponding period last year:—1892: Wheat, 28s. 9d.; Barley, 27s. 7d.; Oats, 17s. 9d. 1891: Wheat, 36s. 7d.; Barley, 30s. 11d.; Oats, 20s. 6d.

HAY.

Averages.—The following are the averages of the prices at the various metropolitan markets during the past week:—Clover, prime, 80s. to 115s.; do., inferior, 46s. to 75s.; Hay, best, 80s. to 112s.; do., inferior, 26s. to 50s.; and Straw, 26s. to 44s. per load.

THE WEATHER.

[By the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fabr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

The districts indicated by number in the first column are the following:—

- 0, Scotland, N. Principal Wheat-producing Districts—1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, S.
- Principal Grazing, &c., Districts—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; (* Channel Islands.)

THE PAST WEEK.

The following summary record of the weather for the week ending November 5, is furnished from the Meteorological Office:—

"The weather varied considerably in different parts of the Kingdom. Over Ireland there were

several very fine, bright days; although during the latter part of the time there was frequent rain. Over the greater part of Scotland the conditions were generally cloudy or dull, with slight rain almost daily; while over England the weather was very rainy at first, then fine and dry, with local fogs, and finally rainy again.

"The temperature differed very little from the mean in any district. The highest of the maxima were recorded either on November 3 or 4, and ranged from 59° in 'England, S.,' 'Ireland, S.,' and the 'Channel Islands,' to 55° in 'England, N.E.' The lowest of the minima were registered either on the 1st or 2nd, when they ranged from 24° in 'England, N.E.,' the 'Midland Counties,' and 'England, S.W.,' to 31° in 'Scotland, N.,' and to 35° in the 'Channel Islands.'

"The rainfall greatly exceeded the mean in 'England, E. and S.,' and slightly in the 'Midland Counties,' 'England, S.W.,' the 'Channel Islands,' and over Ireland. In Scotland and the northern parts of England the fall was less than the normal.

"The bright sunshine was less than the mean in 'Scotland, N.,' 'England, S.,' and the 'Channel Islands,' but exceeded it in all other parts of the kingdom. In Ireland the excess was very large. The percentage of the possible duration which was actually registered ranged from 63 in 'Ireland, S.,' and 58 in 'Ireland, N.,' to 41 in 'England, N.E.,' to between 37 and 39 over the west of Great Britain, and to only 22 in the 'Channel Islands,' 18 in 'England, S.,' and 13 in 'Scotland, N.'"

NOTICES TO CORRESPONDENTS.

*. PHOTOGRAPHS, DRAWINGS, OR SPECIMENS.—We shall be pleased to receive from our Correspondents notes relating to interesting Gardens, together with Specimens or Illustrations of interesting Plants. Although circumstances prevent us in all cases from reproducing them, we are nevertheless glad to receive them, and as far as possible to utilise them for the benefit of our readers.

ARBOR VITE AND YEW: *J. W.* We do not remember any case in which stock has suffered from eating the former, although if eaten in large quantities it might have injurious effects. Deer will eat the shoots in hard weather without being injured by it. Yew, on the contrary, acts sometimes as a poison if eaten greedily by stock that have not got accustomed to it by moderately partaking of it. The wilted shoots are more dangerous than the fresh. Have you Meadow Saffron, *Colchicum autumnale*, growing in the pastures in quantity? This plant is frequently a cause of the loss of horses, cows, &c.

CATERPILLAR ON LIME TREES: *An Old Subscriber.* Before we answer you, we should like to inspect the caterpillar next year. It might be that of the goat moth or the buff-tip moth. The chrysalids winter in the soil under the trees, and might be forked out and collected at a little cost.

CHINESE SACRED LILY: *J. T. F.* Strictly speaking, not a "Lily," but *Narcissus tazetta*. A bowl filled with the bulbs in flower was figured in the *Gardeners' Chronicle*, April 13, 1889.

CHRYSANTHEMUMS DAMPING OFF: *C. T. C.* Keep the air of the house slightly warm, say 45°—50° by means of fireheat, and afford ventilation in considerable amount by opening the upper lights or ventilators, and afford a little at night. Be careful not to slop water about, and mop up that which runs from the pots when affording water. Let the plants stand quite two feet apart, and as near the glass as is convenient.

COCOS WEDDELIANA: *F. C.* When the plants reach mature age they will flower. It is not a rare occurrence.

CORRECTION: *Chrysanthemums* Charles Bonstedt and Vesuvius, reported on p. 565 to have come from Mr. H. J. Jones, were exhibited by Mr. Robert Owen, Castle Hill, Maidenhead.

IRIS GERMANICA: *J. A. Climpson.* There is no trace of fungi in the Iris, but plenty of maggots still in the rhizomes "all alive," and we think these sufficient to account for everything.

NAMES OF FRUITS: *E. B. G.* 1, Blenheim Orange; 2, Brownlee's Russet; 3, not recognised; 4, Warner's King; 5, Hollandbury; 6, King of the Pippins; 7, not recognised; 8 and 10, Beauty of Kent; 9, Dandelow's Seedling; 12, Hambleton Deux-ans; 13, Hanwell Souring; 14, Duckshill; 15, Ringer; 16, Reinette de Caux; 17, Mabbott's Pearmain.—Pears: 1, Beurré Superfin; 2, Beurré Clairgeau; 3, Verulam; 4, Beurré Bachelier; 5, too much decayed.—*M. Brodie.* 1, Pitmaston Duchess; 2, Van Mons Leon le Clerc; 3, Knight's Monarch; 4, Beurré Diel; 5, Duchesse d'Angoulême; Apples: 8, Hanwell Souring; 9, Brabant Bellefleur; 10, Minchall Crab; 11, Gravenstein; 12, Betty Geeson.—*E. G. Allen.* 1, Rosemary Russet; 2, Adams's Pearmain; 3, Striped Beefing (?); 4, Golden Russet or Rosemary Russet; 5, Cellini Pippin; 6 and 7, Striped Beefing.—*G. Southcott.* 1, King of the Pippins; 2, Cockpit; 3, not known; 5, Kerry Pippin.—*R. C. W.* Pear, Beurré d'Arenberg; 3, Apple, Barossa; 7, not recognised.—*H. R. Pears.* 1, Thomson's; 2, Beurré Bachelier; 3, Uvedale's St. Germain. Apples: 1, Margil; 2, past recognition; 3, Stirling Castle; 5, Non-such; 6, Warner's King; 7, Manks' Codlin; 8, Col. Vaughan; 11, Royal Somerset; 12, Court of Wick; 17, King of the Pippins; 20, Northern Greening; others not recognised.—*Reginald.* 1, King of the Pippins; 2, Alfriston; 3, Rymer.—*Pat.* Apple: The Queen.—*R. J. S.* 2, Devonshire Red; 3, Tower of Glamis; one Apple and two Pears rotten.—*John Julian.* 1, Duchesse d'Angoulême; 2, Marie Louise d'Uccle; 3, Doyenné du Comice; 4, Duchesse d'Angoulême; 5, White Doyenné; 6, Lord Lennox; 7, Adams's Pearmain; 8, Manks' Codlin.—*T. R.* 1, Beurré Rance; 2, Crassane; 3, 4, Marie Louise; 5, Easter Beurré; 6, Passe Colmar.

NAMES OF PLANTS: *H. M. P.* *Euonymus europæus*.—*F. P. D.* *Gossypium herbaceum* (cotton plant).—*W. T.* *Trapa natans* or its variety, *T. bispinosa*—The Singhara Nut.—*C. C.* *Maxillaria* sp. Send better specimen with bulb.—*A. G. H.* *Oncidium cæsum*.—*H. T. B.* *Cotoneaster frigidus*.

POWDERED SEEDLINGS: *Constant Reader.* Do not waste space and labour in growing these on to fruiting stage, unless you have a very high, big stove, as the tree will grow to a height of perhaps 25 feet. If you reside in a southern county (seaside), the plants will grow well and flower on a south wall, and may be trained either as a Peach (fan), or horizontally like the Pear. There are dwarf, double-flowered varieties, fit for pot culture, which are very pretty decorative greenhouse plants.

PYRUS JAPONICA FRUITS: *C. M. W.* The fruits are scarcely edible in the way that Apples are, but, like Crabs, they would make a nice preserve or jelly. By the way, Medlars, now in season, make a jelly when bletted, equal to that made of the Guava.

SEEDLING APPLE: *W. Davis.* A pretty-looking fruit, but too acid for dessert, and too small for kitchen use. There are so many good Apples now to be had.

SEED PODS OF CATTLEYA MOSSIE: *R. G.* Without actually testing the seeds by sowing them on a pan of sphagnum moss, peat, and crocks, it is not possible to determine which if any are fertile seeds. Usually there is a great deal of chaff to a very few good seeds in a pod of any species of Orchid ripened in this country.

COMMUNICATIONS RECEIVED.—*J. R. J.*—*P. N.*—*F. M.*—*W. E. G.*—*Arborist* (anonymous).—*R. C.*—*J. R.*—*H. D.*, Berlin.—*W. E. W.*—*H. F. C.*—*R. E.*—*E. CAMPBELL & CO., 116, TRONGATE, GLASGOW. ESTABLISHED 50 YEARS.

ESTATE SALES.

The Best County Medium for Advertising Sales of Estates is

THE "WORCESTER HERALD,"

ESTABLISHED 1794.

The Leading County Paper. Extensive circulation among the upper and middle classes in Worcestershire and adjoining counties. Advertisers would do well to forward for reference and distribution plans and particulars of Estates, Catalogues of Machinery, Furniture, Books, and other Property advertised in the Columns of the "HERALD."

Sales of Stock and Agricultural Effects.

The "WORCESTER HERALD" is the most effective organ for giving publicity to announcements of this class. It is the leading Agricultural Paper in the County, and Circulates most extensively among Agriculturists in and around Worcestershire.

Farms to Let.

Land Agents, Estate Managers, and all having Farms to Let would do well to advertise in the "WORCESTER HERALD," the Leading County Paper. Specially adapted for bringing such notices before Tenant Farmers. Large circulation. Moderate charge.

Situations Vacant and Wanted.

For producing results the "WORCESTER HERALD" is recognised as a specially good medium. Cheap Rates. Apply for terms.

SPECIMEN FREE. Price 2d. Published Friday for Saturday.

FIXED.

Full Particulars on application. Testimonials:—

From Mr. J. WILLARD, Head Gardener to the BARONESS BURDETT-COUTTS, Holly Lodge Gardens, Highgate, N., July 12, 1892.—"Dear Sirs, Having given your Improved Garden Gully a fair trial, I may say that it proves in use all that you claim for it, and in my opinion has, for the sides of walks and drives, many advantages over the ordinary grating. Perhaps the best proof I can give you of this is that, as opportunity offers, I intend to use them instead of gratings. Faithfully yours, J. WILLARD."—To Messrs. VINCE & VINE.

From W. WALTON, Esq., Secretary to the LONDON CEMETERY COMPANY, The London Cemetery Company, 29, New Bridge Street, Blackfriars, E.C., July 25, 1892.—"To Messrs. Vince & Vine, Highgate. I am very happy to testify that your Patent Garden Gully-Frames in lieu of the old-fashioned gratings answer admirably. They were by my authority fixed in a new pathway made in Highgate Cemetery, and in the recent thunder showers they were severely tested and were

THE IMPROVED GARDEN GULLY (VINCE'S PATENT).

This useful invention is a great improvement on the ordinary Garden Grating, and is especially suitable for hilly walks and drives. As they never get stopped by rubbish or sand they effectually prevent the washing away of the gravel in heavy storms, and they save half the labour in cleaning out the cesspools. The prices are:—

6-in., 1s. 6d.; 8-in., 2s.; 10-in., 3s.; 12-in., 6s. 6d.; 15-in., 8s. (The larger sizes are very strong for carriage drives.)

most effectual in preventing the scouring of the gravel. At the inspection my Directors were much pleased with them, and gave instructions that they were to be used when required at Nunhead Cemetery.—I am, yours truly, W. WALTON, Secretary."

From Messrs. CUTBUSH AND SON, Highgate and Barnet Nurseries.—"Highgate Nurseries, London, July 27, 1892.—Dear Sirs,—Referring to the Improved Garden Gully you fixed for us some months ago, we are glad to say it answers admirably. As you are aware, our Nurseries here are very hilly, and during the recent storms all the ordinary gullies were blocked, whereas yours was in good working order. We shall not hesitate to recommend the same to anyone requiring the gullies for sides of paths and carriage-drives, and we feel certain, when it is known, there will be a great demand.—We are, yours faithfully, WM. CUTBUSH AND SON.—Messrs. VINCE & VINE."

TO FLORISTS.—A thoroughly experienced and artistic FLORIST seeks a situation in a first class business.—**A. C., Gardeners' Chronicle Office, 41, Wellington Street, Strand, W.C.**

HOLLOWAY'S OINTMENT and PILLS.—Much watchfulness must be exercised at the present time, and the earliest evidences of ill health must be immediately checked, or a slight illness may result in a serious malady. Relaxed and sore throat, diphtheria, quinsy, coughs, chronic cough, bronchitis, and most other pulmonary affections will be relieved by rubbing this cooling Ointment into the skin as near as practicable to the seat of mischief. This treatment, so simple and effective, is admirably adapted for the removal of these diseases during infancy and youth. Old asthmatic invalids will derive marvellous relief from the use of Holloway's Remedies, which have brought round many such sufferers and re-established health after every other means had signally failed.

AWARDED TWENTY PRIZE MEDALS

AT INTERNATIONAL EXHIBITIONS AT HOME AND ABROAD.

KEITH'S PATENT BOILERS, THE "CHALLENGE," "VIADUCT," "PYTHON," &c.,

FOR HOT-WATER HEATING, "STAND FIRST," require no building work around them, are entirely water-jacketed, and heat from 50 feet up to 20,000 feet of 4-inch pipe respectively. Many thousands are in use all over the world, and the Boilers are unrivalled in power and economy.

Manufactured under 30 James Keith's Patents in Great Britain, United States, and Canada.

This Engraving "illustrates the most powerful form of Boiler that has yet been made for Hot-water Circulation."—Extract from Hood, on *Warming by Hot-water*, New Edition, 1891.

KEITH'S "PYTHON" BOILER, as illustrated, has 1,000 square feet of effective heating-surface, with 17½ square feet of fire-grate area, heats about 20,000 feet of 4-inch pipe, and is the Most Powerful and Complete Sectional "Special" Hot-water Heating Boiler in the World.

JAMES KEITH (C.E., Assoc. M.Inst.C.E.), Gas, Hydraulic, Heating, Ventilating, and Consulting Engineer. Established 1823. Contractor to Her Majesty's Government. 57, HOLBORN VIADUCT, LONDON, E.C., ALSO AT EDINBURGH AND ARBROATH.

Mountain ASH, Forcing RHUBARB, GOOSEBERRY and CURRANT TREES at lowest prices. JOHN PEED AND SONS, Streatham, S.W.

VICTOR POTATOS (SHARPE'S).

This favourite first early Potato, suitable for any Garden, indispensable for Forcing and Early Borders, and likely to take the first rank amongst first earlies for market use. Quality and yield all that could be desired. One well known market grower has this year had a yield of 15 tons per acre on a large acreage. London and Manchester salesmen speak highly of their quality, and report that Victors will keep their bloom and have a fresh appearance after being in the market some days, when other early Potatos have become discoloured and unsaleable.

The stock we offer is the true yellow-fleshed variety and not the white variety, which is often substituted. Price per cwt. and ton. State requirements to

W. W. JOHNSON & SON, Seed Growers and Merchants, Boston, Lincolnshire.

FERNS A SPECIALITY.

ILLUSTRATED CATALOGUE of FERNS (No. 22), 2s. post-free.

It contains 150 Illustrations, and an immense amount of interesting and instructive matter of great value to all Fern Cultivators.

SPECIAL AUTUMN LIST NOW READY, FREE ON APPLICATION.

W. & J. BIRKENHEAD, F.R.H.S., FERN NURSERIES, SALE, near MANCHESTER.

WE have just received the following, which we think will convince all how well all our Plants succeed from one end of the earth to the other:—

"THE HAMILTON TRIBUNE" (Australia), October 5, 1892.

"Mr. H. S. James, the Curator of the Hamilton Public Gardens, says he has received a valuable consignment of Chrysanthemums from Messrs. H. Cannell & Sons, at Swanley, in Kent. There are seventy-five plants, and only two of them were damaged, the rest being in splendid condition, and amongst them are several very expensive specimens, one plant rejoicing in the name of Duck Parker."

Messrs. D. HAY AND SON, Montpelier Nursery, Auckland, New Zealand.

October 8, 1892.

"Dear Sirs.—We have very much pleasure in stating that we received the plants, and we do not think we shall lose one, they appear so fresh. We are much pleased, and enclose you another order, which we will thank you to send on as before."

The "MOUNT GAMBIER STAR" (South Australia), October 5, 1892.

"The champion bloom in the show was Cannell's 'Swanley Yellow,' a grand flower, large, symmetrical, and measuring seven inches and a quarter across. There were numerous other blooms almost equally as large, and one or two larger, but none combining all the good qualities of that from Swanley."

Mrs. BOREHAM, San Antonio, Puerto Orotava, Teneriffe, Canary Islands, November 4, 1892.

"I have much pleasure in informing you that the plants have arrived in most excellent condition, far better than I have ever had any before. If they do not thrive the fault will be mine."

W. H. S. BELL, Esq., Attorney, Johannesburg, South African Republic, October 14, 1892.

"The Chrysanthemums reached me in excellent condition."

H. CANNELL & SONS, SWANLEY, KENT.

EXHIBITIONS.

THE IMPROVED GARDEN GULLY (VINCE'S PATENT).

This useful invention is a great improvement on the ordinary Garden Grating, and is especially suitable for hilly walks and drives. As they never get stopped by rubbish or sand they effectually prevent the washing away of the gravel in heavy storms, and they save half the labour in cleaning out the cesspools. The prices are:—

6-in., 1s. 6d.; 8-in., 2s.; 10-in., 3s.; 12-in., 6s. 6d.; 15-in., 8s. (The larger sizes are very strong for carriage drives.)

FIXED. Full Particulars on application. Testimonials:—
 From Mr. J. WILLARD, Head Gardener to the BARONESS BURDETT-COTTES, Holly Lodge Gardens, Highgate, N., July 12, 1892.—"Dear Sirs, Having given your Improved Garden Gully a fair trial, I may say that it proves in use all that you claim for it, and in my opinion has, for the sides of walks and drives, many advantages over the ordinary grating. Perhaps the best proof I can give you of this is that, as opportunity offers, I intend to use them instead of gratings. Faithfully yours, J. WILLARD."—To Messrs. VINCE & VINE.
 From W. WALTON, Esq., Secretary to the LONDON CEMETERY COMPANY, The London Cemetery Company, 29, New Bridge Street, Blackfriars, E.C., July 25, 1892.—"To Messrs. VINCE & VINE, Highgate. I am very happy to testify that your Patent Garden Gully-Frames in lieu of the old-fashioned gratings answer admirably. They were by my authority fixed in a new pathway made in Highgate Cemetery, and in the recent thunder showers they were severely tested and were

most effectual in preventing the scouring of the gravel. At the inspection my Directors were much pleased with them, and gave instructions that they were to be used when required at Nunhead Cemetery.—I am, yours truly, W. WALTON, Secretary."

From Messrs. CUTBUSH and SON, Highgate and Barnet Nurseries.—"Highgate Nurseries, London, July 27, 1892.—Dear Sirs,—Referring to the Improved Garden Gully you fixed for us some months ago, we are glad to say it answers admirably. As you are aware, our Nurseries here are very hilly, and during the recent storms all the ordinary gullies were blocked, whereas yours was in good working order. We shall not hesitate to recommend the same to anyone requiring the gullies for sides of paths and carriage-drives, and we feel certain, when it is known, there will be a great demand.—We are, yours faithfully, WM. CUTBUSH and SON.—Messrs. VINCE & VINE."

MESSENGER & CO.'S New CATALOGUE of Greenhouses and Heating Apparatus,

Just issued, will be found the most complete, practical, and reliable guide to all about to build, alter, or heat Greenhouses. Illustrations of every description of Glasshouse, from the largest range of Winter Gardens to the simplest forms of Portable Greenhouses, Plant Protectors, and Garden Frames; also of all the best kind of Boilers, Hot-water Pipes, and all appliances for heating. This Catalogue, possessing hundreds of illustrations of all the latest improvements in greenhouse building and heating, is on a scale never before attempted. It should be in the hands of every one interested in gardening, as it contains many practical hints on the subjects of which it treats, the result of many years' experience. **Price, 2s. post-free.**

A large number of the illustrations are taken from greenhouses erected by us in various parts of the country; an inspection of this Catalogue shows, therefore, buildings the efficiency of which has been well tested by actual use. The advantages possessed by us enable us to carry out work with the utmost promptness, and in the very best style, at prices which defy competition. Surveys made, and gentlemen waited on in any part of the country. Plans and Estimates free on application.

J. W. SILVER, Streatham & Norbury Nurseries, S.W.

THE COLORADO BLUE SPRUCE,

PICEA PUNGENS GLAUCA.

Handsome specimens, 2, 3, 4, 5, and 6 feet high. These are all of the *Blue* type, and undoubtedly the finest Plants in Commerce. They are all Seedlings, the plants usually met with being grafted on the Common Spruce Fir.

ANTHONY WATERER,
KNAP HILL NURSERY, WOKING, SURREY.

CHOICE SEEDS

JAS. BACKHOUSE & SON

Beg to invite the attention of Gardeners and Seedsmen to the following:—

BACKHOUSE'S EBOR PEA.

This is an excellent Pea of the Ne Plus Ultra class. Whilst possessing all the good properties of the best type of Ne Plus Ultra, it is from two to three weeks earlier; a characteristic which both in private and market gardens must cause it to be largely grown as a main-crop Pea.

Per pint, 2s. 6d.; per half-pint, 1s. 6d.

BROCCOLI. Backhouse's Winter White Protecting.

This popular sort has stood the test of twenty years' cultivation. Obtained originally from Snow's Winter White, it is now in season from January to March. Its pure white heads are well protected by enfolding leaves—enabling it to stand 15° to 20° of frost without injury—and supplying the table at a time when vegetables of delicate flavour are exceedingly scarce.

Per packet, 1s. Per ounce, 2s. 6d.

BRUSSELS SPROUTS. Extra Select Dalkeith.

We have much pleasure in recommending this as the finest type of Sprouts we know. First-class Certificates were awarded it at the York Chrysanthemum, Fruit, and Vegetable Shows in 1888 and subsequent years. It is of vigorous growth, with densely set, compact sprouts; most prolific, firm, and hardy.

Per packet, 6d. Per ounce, 1s. 6d.

YORKSHIRE FAVOURITE MELON.

Having grown this Melon for some years, we have much pleasure in recommending it for general cultivation. It was raised by Mr. W. Boosal, Manager of our Harrogate Branch Nursery, by hybridising William Tillery with Read's Scarlet-fleshed. The result is a handsome beautifully netted, well formed, scarlet-fleshed fruit of excellent flavour, unsurpassed for Table or Exhibition. If not so large as William Tillery, it is of good Exhibition size (3 to 4 lb.), and of superior appearance and quality; and as such we anticipate it will be in great request, and become a permanent favourite with cultivators.

Price per packet, 2s. 6d.

The above can be obtained wholesale of:—
Messrs. HURST AND SON, 152, Hound-ditch, London.
Messrs. NUTTING AND SONS, 106, Southwark Street, London.
Messrs. JACOB WRENCH AND SONS, London Bridge.
Messrs. COOPER, TABER & CO. (Limited), 90, Southwark Street, London.
Messrs. DICKSON, BROWN AND TAIT, Corporation Street, Manchester.
Messrs. HARRISON AND SONS, Seedsmen, Leicester; or of

JAMES BACKHOUSE & SON, SEEDSMEN, YORK.

SPECIAL TRADE OFFER,

at reduced prices, as follows, all fine healthy trees:—
500,000 RHODODENDRONS, from 2 to 4 feet.
ASH, Common, 3 to 4 feet, 4 to 5 feet, 5 to 6 feet, 7 to 8 feet, 9 to 10 feet.

Mountain, 3 to 4 feet, 6 to 7 feet, 9 to 10 feet, 10 to 12 ft.
BEECH, Common, 3 to 4 feet, 4 to 5 feet, 7 to 8 feet, 10 to 12 ft.
BIRCH, 9 to 10 feet, and 10 to 12 feet, fine.
CHESTNUTS, Horse, 3 to 4 feet, 5 to 6 ft., 8 to 9 ft., 9 to 10 ft.
ELM, 3 to 4 feet, 6 to 8 feet, 9 to 10 feet, stout.
LIMES, red twigged, 6 to 7 feet, 8 to 9 feet, 9 to 10 feet.
PINES, Weymouth, from 2 to 6 feet, various sizes.
POPLARS, 3 to 4 feet, intermediate sizes up to 10 feet.
PRIVET, oval-leaf, 2 and 3 feet; evergreen, 3 to 4 feet.

A FULL-PAGE WOOD ENGRAVING, by W. J. WELCH, illustrating THE GARDENS of the ALCAZAR, SEVILLE, Is presented as a Supplement in this week's issue. Subscribers should see that the Supplement is supplied with their Copy. Full-page Illustrations will frequently be inserted in this paper without extra cost.

THE

Gardeners' Chronicle.

SATURDAY, NOVEMBER 19, 1892.

THE GARDENS AT SEVILLE.

[SEE SUPPLEMENTARY ILLUSTRATION.]

THE lover of all that is beautiful and natural in gardening will find Seville alone worth journeying from England to see. True as it unquestionably is that the climate of Andalusia possesses every quality favourable to the luxuriance of tropical vegetation, it is a much more potent factor in Spanish floriculture that with the Spaniards the love of flowers is a passion, compared to which their religion is only a minor matter. The Spanish woman, young or old, rich or poor, does not consider herself properly dressed without having in her hair a bright flower or two, which, with her inevitable mantilla and fan, seems to endow the plainest of them with the quality termed by Spaniards *la sal*, an untranslatable expression, by which is meant a mixture of *nonchalance*, vivacity, and an infantine grace, utterly foreign to our northern characteristics. A Camellia, a *ramillete*, or small bouquet of Roses, or a small bunch of *claveles*, are, one or the other, nearly at all times available for one real (= 2½d.) or less.

It is, however, the gardens of the famous Alcazar at Seville, rather than the extravagant, if excusable, passion for cut flowers, that form the subject of the present article. It may be mentioned here, however, that public gardens in Southern Spain are very few, and, as a rule, very poor, and in every instance possessed of what may be termed the demon of utilitarianism, which sells every flower that can be converted into hard cash. The gardens attached to private houses differ in nearly every respect from those in this country. They are, like nearly everything else in Seville and other large towns in the province, essentially oriental, redolent of the *Arabian Nights* stories, and just as impossible to realise in the minds of those who have never seen them as the stories in that famous collection of marvellous deeds. It is neither in the front nor at the back of the houses that the gardens are found, but in the *patio* or courtyard, with its marble pavement, the inevitable colonnade and fountain encircled with Bananas, Lemon trees, and other foliage effects, occasionally relieved with a few bright flowering plants. It is not so much a matter of quantity or rarity as it is of general harmony; for the charming *tout ensemble* is due rather to extraneous circumstances than to anything else.

The populous parts of Seville, or, to give it its much more euphonious Spanish name, Sevilla, are Moorish, and the houses on either side of the streets were erected long before cabs, omnibuses, and other vehicles were introduced. The result is that, as in our own Grub Street, where—

“(But that bards are never friends), Bards might shake hands from adverse windows.”

But inconveniently narrow as are these streets or *calles*, they are nearly always gay to profusion with flowers. From the top down to the first floor, the little verandas are gay with small Bananas, Pelargoniums, and other plants; whilst at times some luxuriant climbing plant throws quite an arcadian glamour over the most poverty-stricken and dingy outlook. The plants one sees most frequently in the windows and balconies are various kinds of Amaryllis, but more especially regina, belladonna, and formosissima, whilst the Tuberose is a very deservedly universal favourite; Pelargoniums or Geraniums and the Jasmine are met with on every hand, whilst the sweet-scented Verbena, Aloysia citriodora—which, by the way, was named in honour of Maria Louisa, mother of Ferdinand VII., King of Spain—is seen in every nook and cranny. Narcissus, Tulips, and other bulbous plants are common enough in season. Occasionally one gets a glimpse of Poinciana pulcherrima and *Abrus precatorius*, and of one or other of the Plumierias; but the list of exotic plants grown in and around Seville would, if compiled, be striking in its extreme brevity. The Sevillanos, as a whole have, however, gone on very contentedly for centuries with their extremely narrow selection by way of exotic plants, and the most casual visitor cannot but agree that they produce charming effects with a very few things.

In the suburbs of this and other large towns and cities in Andalusia, we meet with examples where the foreign element has been introduced, and the introduction is in keeping with the hideous architectural incongruities of which the tourist in Spain has so many illustrations—the grafting of the ornate devotional Spanish upon the severely plain massive and harmonious phase of art peculiar to the Moors at their best periods. Here, at Seville, for example, we have an emphatic illustration of this kind of incongruity in the Duc de Montpensier's garden; its formal Italian style, introduced with the cinque-cento fashion, which was so much favoured from the time of Carlos Quinto down to the middle of the last century, when it was rendered still more hideous by the mania of Philip V. for everything *à la Louis Quatorze*. Now, as a matter of fact, these fashions or modifications of fashions are no more suitable to Andalusia than the Chinese method of gardening is to Great Britain; and wherever they occur they only strike one as hideous anomalies. They may be suitable—and scarcely anybody with an eye to artistic effect will admit even this apposition—to a northern climate where art has to a certain extent to supply some of the deficiencies of Nature, but in a place like Seville anything approaching formality in gardening is out of place. For here the hedges are formed of Myrtle, and the walls of suburban gardens are literally covered with Orange, Lemon, Citron, and Lime trees, all growing together with a prodigality and with an effect truly delightful to the English visitor.

But from a horticultural, as well as from an historical, point of view, the chief interest and glory of Seville centres in the Alcazar. And here, after passing through the narrow, paved streets of the city, and the splendour of the Moorish palace, one can easily imagine oneself in fairyland. Readers of that mad book, *La Vida y Hechos del Picaro Guzman*, originally published in 1599, fully a century and a quarter before *Gil Blas*, will recall the description of these gardens in the ninth chapter of the first book. "You have," writes the author, "probably been in the gardens of the Palace of

Seville, and you know what is called the upper and the lower part of the garden; there are two gardens, one upon the other; the upper one, supported upon arcades, is on a level with the first storey, and can only pass for a small parterre; the under one, which is larger, was then only open to the noblemen of the Court, who were free to enter it at certain hours. The upper garden was for the ladies only, who there took their walks to show themselves to the knights, with whom they conversed over the balustrade, which rises to a leaning-height all round the garden." The Sevillanos boast that—

"Quien no ha visto Sevilla
No ha visto maravilla;"

and there can be no question about the fact that those who have been to Seville and have not seen the gardens of the Alcazar, have missed one of the most charming spots in the peninsula. The Alhambra at Granada, is matchless in its grandeur, in its poetic associations, and it has

FIG. 91.—SEEDS OF CARICA, GERMINATING WITHIN THE FRUIT. (SEE P. 612.)

been, rightly as we think, termed "the loveliest spot on earth." But the Alcazar of Seville and its gardens have a scarcely less fascinating halo, for they represent the brightest and the most elegant of the Moorish period. To those who have visited the place, and can comprehend the passionately-devoted phase of the Moorish character, will readily believe that it was the city most beloved of the Moslem, "who planted it on the banks of the Guadalquivir to dream life away amid the enchantments of refined taste, and on which he lavished his gold and genius to adorn and his blood to defend and fortify."

Begun in 1181 by the Toledan architect, Jalubi, the Alcazar has gone through the inevitable course of changes which have not been uniformly for its benefit. So far as the gardens are concerned, the hand of Don Pedro the Cruel (1369—1379) made them practically as they stand to-day. The first impressions of the gardens, as the visitor leaves the palace (which during the past few years has been renovated at a great expenditure of money

and a severe economy of taste), is one of disappointment at the cinque-cento taste, with its ponds and closely-clipped hedges of Box and Myrtle. But Nature, being allowed to have pretty much of her own way, has overcome the formalities of art in a most effective manner. The Rose trees (mostly white), the Palm, the Palmetto, Scarlet Pelargonium, Pomegranate, Oleander, Magnolia, Cypress, and Coral trees flourish here in great profusion. The *baños* or baths, are partly hidden by Orange and Citron trees; and from one of the former which looks certainly the oldest tree in the place, said to have been planted by Pedro the Cruel, the guide, with an eye of course to an increase in the "tip," presents (as in the case of the present writer), the autumnal tourist with one of the fruits. In every shady corner and wall of the garden, the *Culantrillo de pózo*, or Maidenhair Fern, grows with the greatest vigour. The gardens here are full of interest, the most interesting indeed in Andalusia, and the present indolence and apathy of the Spaniards in the matter of restoration and improvement, is, so far as regard the gardens of the Alcazar, a matter of great thankfulness to those who have witnessed elsewhere the extremely vulgar taste in which "restorations" have been carried out. They are much more beautiful and interesting than those of the Alhambra, and it is not at all difficult to believe the old chronicles in which they are recorded to have been the scene of many a wild and daring outrage, intrigue, ambition, love, hate, and revenge. But the most curious "show thing" in the gardens consists of an extremely ingenious but simple arrangement, by which hundreds of jets of water spring up from between the tiles of the pathway.

This half-eastern and half-medieval garden, so full as it is of inconsistencies and anomalies, presents very many points of interest to the horticulturist. Its possibilities may have been fully recognised by the Moors, but the pernicious taste of their successors have done much to spoil what is even now undoubtedly the most charming place of its kind in Southern Spain. *W. Roberts.*

SCILLA LINGULATA (THE TONGUE-LEAVED SQUILL).

This pretty and free-blooming autumn-flowering Squill came to me this summer from Messrs. Dammann, of Naples, under the name of *S. bipartita*, a name quite new, and unknown to me, but which, on being referred to the learned head of the Royal Herbarium at Kew, was at once pronounced to be only a synonym for the plant figured by P. J. Redouté, under the name of *S. lingulata*, on plate 321 of the sixth volume of his splendid work, *Les Liliacées*, an opinion in which I most unhesitatingly concur, after having carefully compared the flowers and foliage of my plants with the plate referred to. Messrs. Dammann, however, demur, asserting that *S. bipartita*, which is a native of Morocco, though nearly allied to, is still botanically different from *S. lingulata*, which flowers with them about a month earlier in the autumn, has smaller clusters and flowers, and is a native of Oran. In answer to which I can only say, that whatever a botanist may think of them from a horticultural point of view, they are one and the same plant. Whatever may be its correct name, the plant now in bloom in my greenhouse makes a very ornamental potful, and blooming at this rather dull and flowerless time of year, is all the more valuable. The colour of the flower is somewhat a lighter shade of blue than *S. bifolia*, and the clusters of flowers are considerably larger. My five bulbs produced eight spikes of flower. *W. E. Gumbleton.*

ROUND BIRMINGHAM.

(Continued from p. 558.)

THE FIRS, WARWICK.—A short run from Birmingham brings us to the ancient county town of Warwickshire, situated on the sleepy willowy Avon, beside which the towers of the massive Warwick Castle rear themselves from their foundation of solid rock. Near by are the gardens of Major Mason, a gardener at heart, and one who in times gone by was on the Council of the Royal Horticultural Society. With an old-fashioned garden of moderate pretensions, and a number of Orchid houses filled with good and interesting plants, the Major and his wife, who takes an equal interest in the gardens, are never at a loss for pleasant recreation. In this collection there seem to be no hard and fast lines as to what shall be grown and what excluded, for samples of most things which are to be had are acquired without question if there is a reasonable probability of their producing pretty flowers. As in other gardens, however, some things are special favourites, and the quantities which are grown far exceed those on trial or those not so well liked. For example, in one of the houses are hundreds of fine sturdy plants of *Lycaste Skinneri*, chiefly bought as fresh imported plants. Out of them some magnificent forms have bloomed, and all are in grand health, which is worthy of remark; for notwithstanding increased facilities for getting and growing *Lycaste Skinneri* in recent times, many utterly fail with it, although some ten or fifteen years ago it was considered one of the plants which everyone could grow. Of the varieties of *Odontoglossum crispum*, *O. Peccatorei*, and other of the handsomer *Odontoglossums*, too, there is a large quantity at The Firs, and that in magnificent condition, the plants being so firmly rooted that any of them would bear lifting by the bulbs, which are hard, clean, and of that bright green which denotes the best of health. Mr. Beale, the gardener at The Firs, is justly proud of his Orchids, and especially of the *Odontoglossums*, *Cattleyas*, and *Lælias*, and other big batches of favourites.

In the large *Cattleya*-house, in two divisions, the specimens of *Cattleyas* and *Lælias* are in fine health, the show of flowers depending mainly on *C. Bowringiana*, and the many and beautiful forms of the new importations of *Cattleya labiata* "autumn-flowering," some of which are far superior to the plant of the original true old autumn-flowering *C. labiata*, which is in bloom in the same house, and which cost twenty guineas, while the fresh importations would not average more than that number of shillings. So much for trade enterprise, which by the outlay of the necessary funds, and the application of the required knowledge, has brought a charming winter flower, which so many of slender purse have longed for in vain, within the reach of all, and by the better forms introduced placed the small amateur of today on a better footing than the rich man of a few years ago in regard to this plant. In this house the *Vandas* are doing well, and one strong plant of *V. suavis* has a large seed capsule procured by crossing it with *V. teres*, which should in time afford good results. *V. cœrulea*, *Cattleya superba splendens*, *C. el dorado*, *C. maxima*, *C. Trianae*, *Lælia grandis tenebrosa*, *L. superbiens*, and the *Miltonias* are very fine. Among the last-named are in flower a fine lot of *Miltonia Clowesii grandiflora*, and one large plant of quite a new type—*M. C. gigantea*, with very large and richly-coloured flowers, the segments broad and blunt, and not acuminate as in the old forms.

Among a host of interesting things, we found many fine *Cypripediums*, some of them in bloom; a large quantity of the showy *Dendrobiums*, specially well cultivated; a full collection of *Angraecums*; a grand lot of *Odontoglossum citrosimum*, and a sturdy plant of *O. coronarium Chiriquense*, which flowers well. Among other fine plants in bloom, we noticed *Maxillaria grandiflora*, *M. venusta*, all the forms of *Lælia pumila*, a beautiful specimen of *Nanodes Medusæ*, *Oncidium macranthum*, some species of *Masdevallias*, *Vanda Kimballiana*; the extremely rare and pretty *Saccolabium paniculatum*, with two five-branched spikes of its pretty white and pink flowers, and in

one of the lobbies a noble specimen of *Crinum amabile*, which, with *C. Mooreanum*, is used for decoration indoors, and with regard to which and other *Crinums*, Mrs. Mason gives a useful hint as to a means of prolonging the duration of the flowers in a cut state. Formerly they were broken, or cut off, with the seed-vessel attached, but when so taken they were soon over when placed indoors. Now they are cut just above the ovaries, and their stem-like tubes placed in the water, and they last twice as long. This hint may doubtless be brought to bear on many flowers with tubular base to the perianth, and which are often used as single flowers.

(To be continued.)

THE NEW LILIES OF WEST CHINA AND TIBET.

UNTIL quite recently very little has been added to our knowledge of the Lilies since the publication of the important monograph of this genus by Mr. H.

FIG. 92.—GERMINATION OF CANICA. (SEE P. 618) A, seed; B, section; C, embryo; D, seedling showing spindle-shaped caulicle; E, section of caulicle; F, cotyledons.

J. Elwes. At the International Botanical Congress held at St. Petersburg in 1884, Mr. Elwes predicted that in the future many new discoveries might be looked for from Tibet and from the mountains of Western China. These predictions have been fully justified, and now new species are pouring in upon us.

The exploration of Upper Burma brought to light four new species—*L. sulphureum*, *Lowii*, *primulinum*, and *Bakerianum*—the first three of which have been brought into cultivation by Messrs. Low & Son, and figured in the *Botanical Magazine*. The collections that have been made lately in Western China and Tibet have shown that these regions are exceedingly rich in new types, belonging to many of our favourite garden genera. The material collected by Dr. Henry and Mr. Pratt has been brought to England, and worked up at Kew by Professor Oliver and Mr. W. Botting Hemsley. The collections made by MM. Armand David, J. Delavay, and Farges, have been sent to Paris, and are now being worked up by M. Franchet. In a recent paper in the *Journal de Botanique*, he has reported on the

Lilies of these collections of the three French missionaries. His paper contains a classified list of all the species now known in China and Tibet. The following is a brief abstract of his enumeration, with a few words about each of the new species:—

1. *L. cordifolium*, Thunb.
2. *L. giganteum*, Wall.
3. *L. mirabile*, sp. nov., Franchet.—West China. Collected in the province of Sutchuen by Father Farges. A *Cardiocrium*, with slender stems 4 feet long, cordate-ovate leaves, with seven to fifteen centrifugal flowers (contrary to those of all other Lilies, the top flowers open first), white, and narrowly tubular, 6 to 7 inches long.
4. *L. longiflorum*, Thunb.
5. *L. Brownii*, Spae.
6. *L. formosum*, Franchet, sp. nov.—West China, province of Sutchuen, in the mountains of Tchen-keou-tin. Discovered by Father Farges. Leaves lanceolate, shortly petioled. Flowers white, erect, broadly campanulate, 6 to 7 inches long, with oblong-lanceolate segments.
7. *L. myriophyllum*, sp. nov., Franchet.—Yunnan, on the Mo-so-yn. Discovered by Delavay. Leaves very numerous (about 200), linear, or linear-lanceolate, bearing bulbillæ in their axils. Flowers usually two, erect, white, large, forming an open cup.
8. *L. yunnanense*, sp. nov., Franchet.—Yunnan. Discovered by Father Delavay. Flowers like those of *japonicum*, white, or slightly tinged purple outside, 3 to 4 inches long. Leaves like those of *L. elegans*.
9. *L. Delavayi*, sp. nov., Franchet.—Yunnan. Discovered by Delavay. Leaves linear or lanceolate. Flowers 1 to 3, like those of *candidum* in form, 3 to 4 inches long, wine-red with brown dots inside.
10. *L. concolor*, Salib.
11. *L. speciosum*, Thunb.
12. *L. Duchartrei*, Franchet.—Found in West Tibet by Father David, in Yunnan by Delavay, and in Sutchuen by Prince Henri of Orleans. Allied to *L. polyphyllum*, Don. Flowers white, dotted with purple, like those of a *Martagon*, but segments not revolute.
13. *L. papilliferum*, sp. nov., Franchet.—Yunnan, the rocks of Caoui-ma-ouan, gathered by Delavay. Also nearly allied to *L. polyphyllum*.
14. *L. lankouense*, sp. nov., Franchet.—Yunnan, gathered in many localities by Delavay. Near *polyphyllum* and the two last. Flowers 1 to 3, white or purplish, dotted inside with black; segments oblong. Leaves linear, lanceolate, produced down to the very base of the stem.
15. *L. Davidi*, Duchartre.—Discovered in Western Tibet in the high mountains, which separate Mou-pine from Satchuen by Father David. Figured by Elwes.
16. *L. Fargesii*, sp. nov., Franchet.—Very near the last. Flowers 1 to 10, yellow, dotted with purple inside, 2 inches long. Leaves linear, with revolute edges.
17. *L. sutchuenense*, sp. nov., Franchet.—Yunnan, province of Sutchuen, near Ta-tsen-lou, discovered by Prince Henri of Orleans, and in the mountains of the district of Tchen-keou-tin by Father Farges. Very near *L. tenuifolium*.
18. *L. tenuifolium*, Fisch.
19. *L. tigrinum*, Gawl.
20. *L. pseudo tigrinum*, Carrière.
21. *L. talienense*, sp. nov., Franchet.—Yunnan, discovered by Delavay. Stem, 3 feet long. Leaves linear or linear-lanceolate. Flowers 1 or 2, whitish, 2 to 3 inches long.
22. *L. ochraceum*, n. sp., Franchet.—Yunnan, discovered by Delavay. Stem, 2 to 3 feet long. Leaves linear-lanceolate. Flowers of the *Martagon* type, yellow, unspotted, with oblong segments.
23. *L. oxypetalum*, Baker. Gathered in Yunnan by Delavay.
24. *L. Thomsonianum*, Lindl. Gathered in Yunnan by Delavay, and in Sutchuen, at Ta-tsen-lou, by Prince Henri of Orleans. J. G. Baker.

CULTIVATION OF THE FIG.

HAVING three divisions for fruiting the Fig, besides several large trees against the walls outside, we are enabled to keep up a pretty good supply for nearly nine months in the year. Our first crop begins to ripen in the month of March from bushes in pots, and with careful attention we generally secure two crops. While at Worksop Manor I had only one Fig-house, and with the exception of the back wall, the house being a lean-to, the Figs were planted out, their roots confined to a space 2 feet wide, and 20 inches deep. The front trees were grown in large pots, but plunged in the border below the rim of the pots, and heavily mulched, and well-fed with liquid-manure during the fruiting season, which was generally a long one from the high cultivation pursued. We used to cool the house down when we could see a good batch of young fruits at the ends of the shoots of the size of Peas, and by catching them just about that size we did not run the risk of losing the first crop the following season. But where there are several houses or compartments for Fig growing, as here, it is not required to work any single house so hard as that. After the first crop is over from the plants in pots, the next supply comes from those planted in brick divisions of somewhat narrow construction, so as to grow fruiting-wood instead of rampant growth. We only take two crops from our succession-house, which come on with the season, with rather higher temperature than that of a green-house; the first crop, although the fruits are large, is seldom a heavy one for this reason. We turn the house into a stove, and between sun-heat and fire-heat we can keep up a stove temperature in order to ripen the second crop, which is generally a large one, which keeps up our supply to the end of the month of November, and the fact of ripening eight or nine fruits on this year's shoot, is the reason that we have a thin first crop. The sort grown is Brown Turkey, and it covers a large space on the back wall. Nine years ago I had the back border made in compartments, 3 feet long, 2 feet deep, and 18 inches wide, planting one Fig tree in each compartment; but the central one taking the lead I removed all the others, and now it nearly fills its space of 40 by 15 feet. This spring it was given another compartment on each side, by taking out the dividing brick walls, and by feeding and mulching it is now ripening-off a very useful crop of Figs. Our next division is a Trentham case, 60 by 10 feet, which covers a large outdoor plant of Brown Turkey Fig, and with a favourable season we are enabled to gather fine fruit from it before cold autumn weather sets in.

There are just sufficient pipes in this "case" to keep out frost, and it is a useful place in the spring for cooling down Strawberries, so as to get them with their true flavour before sending to table.

From this "case" we only take the first crop, which is of good service, coming in before those upon the unprotected walls; and by the end of the season the house is filled with plants of Chrysanthemums, so that on the whole, it makes a very useful place. As to the border, previous to covering the tree with glass, the roots had the full run of it, and growth was in consequence very rampant and unfruitful. In order to counteract this kind of growth, its roots were confined by a brick-wall, which extends all round, and as deep as we could find roots, and still I fear that we have not quite restrained its growth, its roots getting underneath the wall, which shows clearly that in order to make the Fig fruitful under glass its roots must be severely pinched for room, while at the fruiting season it will stand any amount of feeding. Our outdoor Figs, of which we have several varieties, and the trees old and large bear fine fruit freely, and especially in warm summers. At Cuffnells Park, Hampshire, in my time, we used to climb into old standard Fig trees with a basket and fill it with large luscious fruit; and all the pruning we gave those old standards was simply to keep their shoots so that plenty of air got in amongst them, which is pretty much what we do to the Figs here under glass and upon walls. We hardly ever thin out the shoots, and only cut back the shoots when the trees begin to

be short of bearing wood; otherwise, the shoots are tied down to encourage them to break close to the old wood. Outside against the walls, most of the pruning is done in the summer time, which consists of cutting out all small and weakly shoots, to let in daylight to the ripening fruit. The next time that the knife is used is generally pretty soon after the first touch of frost has caused the leaves to fall, when all weak and ill-placed shoots are removed, at the same time all half-grown fruits are knocked off, and as no tying-in is done during summer, the points of the shoots are now bristling with Figlets which are tied-in to the old wood as close to the wall as possible.

I consider a Fig tree in good fruiting order is much less trouble to manage than any other sort of fruit tree, either inside or outside, although the ripening of the Figs outside does in a measure depend upon the season. Our sorts here on the walls are Brown Turkey, Brunswick, White Marseilles which bears well, but the fruit is very tender; and Negro Largo. J. Miller, *Ruxley Lodge, Esher.*

BERLIN LETTER.

WITHOUT doubt, the flower shops show a great improvement this season, when we compare their exhibits with those of former years. Firstly, the number of species of cut flowers is much increased; and, secondly, these are arranged in such a manner that each flower is seen to the best advantage. Formerly our bouquets were so made that they were only large masses of colour, the flowers being crowded together so closely that in most instances it was quite impossible to distinguish any single one. But now one-third of the quantity of blooms that was formerly used suffices to make a bouquet of the same dimensions. That is no disadvantage; on the contrary, the eye can distinguish each flower, and, in consequence, the public looks for improved forms of flowers, and for a greater variety of species. Formerly, in bouquets it was of little consequence if one or more petals were not quite perfect; the blemish was easily overlooked. Now, it is quite impossible to make use of an injured flower, as each is distinctly seen. To adopt a comparison, taken from botany, the bouquets of former times were like a gigantic capitulum of *Matricaria Chamomilla*, whilst they now resemble an inflorescence of an *Ulmus effusa*! There is nothing without cause, and so this change of taste has had a cause, which may be traced to a very interesting exhibition of Japanese flowers which was held here last spring. There were then shown arrangements partly of natural flowers, partly of artificial ones, and copied from Japanese sketches and photographs, which contrasted so very strongly with all hitherto seen that they became popular owing to their peculiarity. Make a thing as different as you will, from what the general public is accustomed to, and I can assure you that amongst a hundred, ten will find it "delightful," and "fashionable," and will desire more like it. So it was with the Japanese arrangements. We have now a style which is a mixture of our own taste and the Japanese, and a cross between the two; it is, I must confess, not a bad one. Gardeners are obliged to employ better flowers. It is highly interesting to watch the development of this new fashion, which is certainly a step in the right direction. The number of species, as already remarked, has been much increased, and as so many new garden plants could not be brought together at once, gardeners used wild flowers; so you may now see in our flower shops, and, curiously enough, even in the best ones, a good many flowers which, a year ago, were only allowed in rustic bouquets. *Centaurea cyanus*, *Lupinus luteus*, *Papaver Rhæas*, *Chrysanthemum Leucanthemum*, wild species of *Orchis*, &c., are now valued. Is this to be regretted? I think not. Also gardeners now cultivate in considerable quantities a great many good old forms and species, which were quite forgotten, and it is to be hoped that gardening, if this taste continues, will return to its former high standard.

It is quite time that it should be so; for it has been degenerating during the last few years, and we see at each season the same flowers, now Violets, then Cyclamen, now Roses, then Lilies of the Valley, &c. Amongst these old plants these are especially common—*Fuchsia*, *Camellia*, fruits of *Physalis Alkekengi*, double *Dahlias*, *Dianthus*, and last, not least, the *Victoria regia*. Since a young gardener, Mr. Siehe, at Steglitz, has succeeded so well in cultivating this queen of flowers in the open air in boxes about 7 feet broad, and 20 to 30 feet long, and has raised flowers and leaves of a size never seen here before, even in *Victoria*-houses, this plant in the next few years will certainly be seen in the flower-shops for decorative purposes still more than it is now; whilst he whom I have named is still the only grower. *Dr. U. Dammer.*

(To be continued.)

NEW ALPINES.

(Continued from p. 399.)

AMONG the interesting and noteworthy plants of which M. Sommier brought us seed from the Caucasus, we should also mention:—

Draba tridentata, DC.—A very pretty little plant, forming on the ground close tufts which are composed of short branches, very pointed glabrous leaves, dark green in colour, resembling the foliage of *Saxifraga juniperina*, or of *Alsine pinifolia*. The flowers are bright yellow, open in May and June, and grow in short dense clusters. The plant, when in bloom, is most effective. It comes from the alpine districts of the Caucasus and Taurus, requires exposure to sun, and a pebbly soil.

Campanula lactiflora, Bieb.—On rockeries and in gardens we grow a *C. lactiflora*, which is nothing more than a white-flowered form of *C. latifolia*. The true *C. lactiflora* of the Caucasus is very little known. It is included in the well-known collection of Mr. Marc Micheli at the Château de Jussy, but I never saw it elsewhere. The Caucasian species is a beautiful one, with graceful and elegant stems, bearing leaves which are sessile, indented at the edges, and slightly pubescent; the flowers are clear white, campanulate, growing in a panicle, the terminal branches are pauciflorous. It blooms in July and August, and requires deep light soil, and a cool shady position.

Digitalis ciliata, Traut.—A beautiful species from the granitic regions of Betscho in the Swania group (Southern Caucasus), at an altitude of from 3600 to 4000 feet. It resembles our *D. grandiflora*, from which it differs by its more hairy calyx, shorter flowers, and the tube of the corolla, which is campanulate. It is a graceful, elegant plant, and flowers freely from June to September. It requires a light soil, and exposure to sun.

Veronica monticola, Traut.—From the Klüsich Valley, in alpine Abchasia. It is a plant from 9 to 12 inches high, with stems trailing over the ground and forming large spreading tufts, the leaves glabrous, oblong-lanceolate, prettily toothed, the flowers small and blue, growing in short and terminal spikes. The plant prefers a sunny rockery, and is increased by division or seed.

Scabiosa Correvoniana, Sommier.—From Eastern Swania, in the alpine districts on the confines of Abchasia. This *Scabiosa* is a handsome bushy plant, with erect stems from 7 to 9 inches high, bearing large heads of flowers of a pale yellow colour, with a large involucre below. Propagation from slips or seed is easy. The plant blooms from May to August. It is a new species, and the description of it by its discoverer will appear shortly in the botanical journals.

There is also a very peculiar undetermined *Dianthus* which is flowering freely with us, and which has flowers much resembling those of the well-known and graceful *D. neglectus* from the Mont Cenis group. The new plant is low-growing, with branches raised only about 4 inches above the ground, and terminated by one or two large flowers of a bright pink inside, and yellowish or bronze-green outside. The stem is leafy. This plant will be assuredly most welcome in gardens; it is so

bright and free-flowering. Doctor And. Baldacci, of Bologna, sent me last year from an excursion in the mountainous regions of Servia and Montenegro, several most interesting plants, several of which are as yet unknown. Among them were:—

Cerastium decalvans, Schloss et Vuk.—A very interesting and peculiar plant, with dry and almost sub-ligneous stems, thin, spreading over the soil; the foliage is like that of a *Gaaphalium*, green, covered with tufts of wool, forming dense and floccose rosettes; the flowers pure white, numerous, and opening in succession during May and June. The plant is increased by division or seed, likes full sunshine and a rockery.

Onobrychis Laconica, Orph.—A very beautiful species, which differs from *O. sativa* by its bright pink and large flowers, by the greater length of the calyx-bracts, the more glaucous foliage, and shorter more compact habit. It requires full sunshine.

Alyssum repens, Banmg.—From Mount Durmitor at an elevation of 6000 feet, is a dwarf spreading species, with lovely yellow flowers, surpassing in beauty those of most of the other *Alyssums*.

Sempervivum patens, Guis.—This is known in gardens, but is rarely the true *S. patens*. Mr. Baldacci has sent it to me from Montenegro, and it has been in full bloom here this summer. It is a pretty species, forming glabrous rosettes of clear almost bluish-green, and bearing beautiful pale yellow flowers.

Chrysanthemum cinerariaefolium, Vis., is an excellent and highly decorative species, well worth cultivation in every garden. The leaves are long-stalked, very finely and deeply lobed and cut, and the flowers are very large and fine. The plant requires rich soil and sunshine; it grows easily from seed. *H. Correvon, Director of the Jardin Alpin d'Acclimatation, Geneva.*

THE APIARY.

FOREIGN BEES.

THE rage for foreign bees seems somewhat to have subsided lately, and is attributable to its becoming more widely known, that there are few advantages to be gained by keeping them. Ligurians still stand far ahead of all the foreign races for a combination of good quality, beauty, gentleness, prolificacy, and honey production. Any beekeeper wanting to try a stock of foreigners is advised to get Ligurians as being the most likely to give satisfaction. Having procured them, it must not be forgotten that they will require somewhat different treatment to that accorded to the native race. Owing to their coming from a warmer country, they will be found to be more susceptible to the vagaries of our climate, having less immunity from such diseases as dysentery and foul brood. They also not infrequently get infested with the parasite (*Braula caeca*), although this is not detrimental, except as regards the comfort of the bees! As Ligurian queens are so prolific, larger hives than ordinary must be provided for them, in order to have a brood-nest to contain thirteen or fourteen frames to give room for the larger number of eggs that will be deposited. It would appear to the uninitiated that with such prolific queens more profit would accrue in the shape of a larger yield of honey, but this is not so, as the extra quantity which must of necessity be gathered by a larger army of workers is used up by the bees themselves, as it goes to feed these and a correspondingly larger number of larvae, the latter requiring an enormous supply. As these bees cap over their honey in such a peculiar way, leaving no air space underneath, and thus making it appear dark, it is best to devote them entirely for producing honey for extracting. This is a serious drawback to Ligurians, as it is certainly better to keep a race of bees that is equally good for comb-honey as well as that intended for the extractor, both of which qualities our native bee undoubtedly possesses. Carniolans have been written up a great deal, but time has only proved that they must take

second place to Ligurians. Coming from a cold and mountainous region, they are hardy enough, but cannot compare with the latter for beauty. They are as prolific as those, and their comb-honey is perfection, only they will swarm immoderately, and for this reason they become a nuisance, especially as they cannot be depended on to do anything else.

TWO QUEENS IN ONE HIVE.

Mr. Wells, the introducer of the new system of bee-keeping, has just given to the readers of the

FIG. 93.—GERMINATION OF TESTUDINARIA ELEPHANTIPES. (SEE P. 618.)

British Bee Journal, the results of his experiments during the past season. He proves, without any display of ostentation, in a concise and business-like statement of hard facts, that this system, as the Americans have it, has "come to stay." His critics mostly argued that they could not see where any advantage could be gained, as it seemed clear to them that, working with two queens in one hive would be only equal to two separate colonies, as the result in honey would be the same. Mr. Wells, although he

states he had already decided the question for himself, determined to devote last season to a demonstration which would be conclusive, and effectually settle the matter. He therefore, with this end in view, started last spring with ten stocks, five of which were headed by single and five with double queens. The conditions at starting were as nearly as possible equal; the hives were close together, so that the same area for gathering honey was available to each, and all had the same amount of care and attention bestowed on them. A record was kept of the quantity of honey taken from each set of hives, and without entering into details, the following was the result:—The single-queen stocks gave an average of 41 lb. of honey per hive, whilst from the double queen stocks the average was as nearly as possible 158 lb., or nearly four times as much again. Considering that if a double-queened stock is compared to two ordinary colonies, which would have together yielded, on the above figures, 82 lb., the gain in honey is nearly doubled by the new system. This way of looking at it, however, is scarcely favourable enough, as the gain in other ways has to be considered. For instance, it should be easier and less expensive to make one large hive than two small ones, and there is less trouble required to work the bees with the former than the latter. Mr. Wells states that he is not able at present to prevent swarming, as three out of his five double hives swarmed. The swarms were very large, one weighing over 14 lb. He returns the swarms, and makes nuclei with the brood-frames taken out previous to putting them back. The average yield from the double hives was not so large this season as last, which is accounted for by the fact of there being no Sainfoin grown nearer than a mile from the apiary, instead of 30 acres being close by as at that time. The weather was also wet when the white Clover was in bloom. The yields from skeps compare in a very ridiculous manner, as it is mentioned that in the same locality, but closer to the Sainfoin, one of the old-fashioned school obtained an average of 7 lb. from ten skeps, and another only about 2 lb. from five skeps. *Expert.*

THE ROSERY.

SELECTING AND PLANTING ROSES.

As the season for planting Roses, both dwarfs and standards, is with us, a few words of advice may be of service to those who think of planting; of course I am writing more for those that are making their first start. In the first place, it would be as well to look over beds and borders, and note down any vacancies, as well as any that may seem to be in an unsatisfactory condition as to health; last year's planted Roses are likely to be in this condition, having been greatly injured by severe weather last season. Prepare all beds and borders by trenching two spits deep, and add a plentiful supply of good rotted manure; should the ground be light, cow-manure would be the best sort to employ, as it keeps the ground cool, but should the ground be heavy loam, then add either pig or horse-manure. Having made up your mind as to the quantity you require, write for a rose-catalogue from a leading firm, and mark the sort you wish to have; always add a few supplementary names, which might be used in case of some sorts being sold out, which I believe will be the case, as Roses are scarce on account of severe weather these last two seasons. Then despatch your order, so that there may be no delay in getting your Roses planted in good time.

November is undoubtedly the best month for planting hybrid perpetuals, Bourbons, Mosses, and the hardier kinds of climbing Roses; but for Teas, Noisettes, Chinas, and Polyanthas, which can be had in pots, I would certainly say April, when we may hope that the severe weather has disappeared, and that they may be planted so as to feel no check, and will go away at once.

As regards planting, I would like to say a word as I believe a great deal of mischief for which the

nurseryman is blamed is due to bad planting. Those budded as dwarfs should be planted with the bud just below the surface of the soil, which should be made firm by trampling. Standards should be firmly planted, and a stake put to them at the same time, so as to prevent them from being blown about with the wind, which causes injury both to root, and hinders success.

As regards protection through the winter, I would also like to say a little. Many place either straw or hay bands, or fill the heads with a lot of material, so that sometimes, with the mildness of the weather, the buds start, and when the protection is taken off, the growth perishes, and thus the plants are spoilt for that season. I believe in protecting the Roses, but in a light manner. Bracken is the best material, and should the weather change to mild at times, it should be taken off rather than be allowed to remain and excite the growth. I would also advise the mulching of all freshly-planted Roses. *W. T. C., Kingston Hill.*

FRUIT REGISTER.

APPLE MARGIL.

I HAVE often heard this Apple praised for the goodness of its flavour, but here in our rather heavy soil it is not good. The fruit has something of the flavour of Cox's Orange and Ribston Pippin, but it is a faint trace. It is said to be a good substitute for the latter, but in my case it cannot be compared with either of these varieties. It is generally a weakly grower, but crops fairly well.

APPLE SANDRINGHAM.

This variety is as yet not much known, but it is one that should be widely grown; the tree being a good grower, bearing a full crop of handsome fruit, of a greenish-yellow colour, striped and dotted with crimson, and it is said to keep well. *E. M.*

NOTES FROM HAM HOUSE, RICHMOND.

PERHAPS there are few places so near to the metropolis which possess greater historical associations than does Ham House. Its claim for special interest lies in the fact that within a few miles of London is to be found this historic relic of bygone days and bygone splendour.

"Here all things in this place remain
As they were ordered ages since."

More than 200 years have come and gone since the time when Macaulay tells us Ham was celebrated for its more than Italian luxury, with its busts, fountains, and aviaries, and even now the stately old red-brick house on the banks of the Thames, surrounded by its leafy avenues, has interest for the visitor. Tradition asserts that the iron gates which face the river have never been unlocked since a Stuart King passed out. But in this tradition errs—like all things human—though until lately, these gates have only been opened on special occasions. Ham House was for a brief time a royal residence, and Prince Henry, the eldest son of James I., dwelt here during a portion of his life.

In 1643, Charles I. granted the manors of Ham and Hatch and the house at Ham to his favourite friend, William Murray, creating him Earl of Dysart. Ham possesses many fine picture, *objets d'art*, and some most valuable old books.

On the north side of the mansion we catch a glimpse of the Thames; while from an opposite window, the eye reposes on a broad terrace, a large stretch of green sward, and beyond some tall Scotch Firs, said to be some of the first planted in this country. A fine avenue of Elms a mile in length, and leading to Ham Common, is an imposing feature. Limes and Sycamores also do wonderfully well here.

The culture of herbaceous plants, comprising the best things, is being taken up with much vigour by Lord Dysart's able gardener, Mr. G. H. Sage, and

are much in keeping with a garden of an ancient house. Michaelmas Daisies, Helianthus, Eryngiums, were noticeable for their beauty in the autumn. I noticed a fine specimen of a plant that we now seldom see in the herbaceous border, *Veratrum nigrum*, a stately hardy perennial, bearing dark purple flowers, almost black, on a spike 7 feet in height, a very conspicuous object in the border.

The kitchen garden is well cropped, and the fruit trees, Apples, Pears, &c., were noted as carrying good crops.

Referring to the indoor department, Grapes in all the leading varieties are excellently cultivated, this fruit being a favourite one with the earl; Figs, Peaches, Nectarines and Pineapples are likewise well grown. *J. B.*

THE WEEK'S WORK.

FRUITS UNDER GLASS.

By J. RIDDELL, Gardener, Castle Howard, York.

VINES.—Where the object of the gardener is to secure ripe Grapes from his permanent Vines in the month of May, everything should be got in readiness at the present time, so that forcing may commence in the first week of next month. The roots of all Vines which have to be forced early should be confined to borders inside the house, so that there may be no very great difference between the temperature of the soil and that of the house. In dealing, however, with Vines having the run of the outside and the inside borders, the treatment to be followed should not differ from that which is proper for inside borders. Assuming that the early Vines have been pruned, and all cleansing of the house and renovating of the border attended to, all that now remains to be done is to make up a hotbed of stable-litter and Oak leaves, first preparing these by well mixing several times, and turning them. Just before the vinery is closed, apply a dressing of equal parts of kainit and basic-slag, or any other forms of potash or phosphatic manure to the border, which should be followed with water and farmyard drainings at a temperature of 100°, sufficient in quantity to thoroughly moisten every portion of the border; and as soon as this is done make the prepared hotbed stuff into a bed on the border, making it as wide as may be most convenient, and of a depth of 2 to 3 feet. This warm coating will prevent in a great measure the loss of the heat imparted by the watering, besides securing warmth and moisture, without which the canes do not generally break evenly or strongly. Maintain a minimum temperature of 50° in mild weather, but allow it to fall 5° if frost is severe, rather than have recourse to hard firing; and syringe the canes twice daily if they should become dry. But this with the large bed of fermenting material, which should be kept slightly moist by syringing it, will not be frequently required at first.

SUCCESSION VINERIES.—These usually contain more varieties than the early houses; and among those Vines which may now be pruned is Duke of Buccleuch. If the hints regarding this variety which I gave in a former Calendar have been acted upon, and young shoots laid in along the sides of the canes, from the top to the bottom, these may be shortened to 2 or 2½ feet; the object of this operation being the securing of young wood in equal quantity on each side, all along the main rod, and with this mode of procedure, if persisted in for some time, the shoots which have current year's crop should be cut back to the bottom laterals, or rather what I should call sub-laterals, and these sub-laterals pruned to a prominent bud for the object of furnishing wood for laying in next year, and yielding fruit the following one. Prune all the other varieties in the second early vinery to a plump strong bud, and top-dress the borders according to previous instructions, not omitting to afford some potash if the black varieties have lacked colour this season.

THE FLOWER GARDEN.

By H. W. WARD, Gardener, Longford Castle, Salisbury.

SELECT TREES AND SHRUBS.—In forming new gardens and improving old ones, some of the following species and varieties of trees and shrubs should be planted among the common kinds, which usually make up the bulk of those planted, many of which are well adapted for planting singly on lawns and in other places where their beauty or quaintness would

be easily observed, and where they would be of decorative value. All are hardy enough to plant in all but the coldest part of Britain, and therefore no one need have any fear about planting them. *Acer* are round-headed, of moderate height; *A. palmatum* is remarkable for the variety in the form and colour of its leaves; *A. japonicum* var. *aureum*, a very distinct variety, has many-lobed leaves, which are of a soft pale yellow, with rose-coloured foot-stalks; *A. palmatum linearilobum* produces long, narrow, slightly-toothed lobes, cut to very near the base; and in the young state they, like the shoots, have a reddish tinge, but become grey with age, the former retaining the reddish tinge in their foot-stalks and margins only. *A. p. septemlobum elegans* is remarkable for the changes of colour which its leaves undergo during the time of their development, changing from a soft fulvous-green to rose, and subsequently to a deep red. *A. p. linearilobum atropurpureum* is a very handsome variety, in which the leaves when first expanded are rose-purple, deepening with age to a bronzy-red hue. *A. p. septemlobum elegans purpureum* has the most bright-coloured of all the varieties of *A. palmatum*; both young shoots and leaves when first developed are of a deep purplish-crimson, which ultimately become suffused with a greenish-black. *A. p. s. laciniatum* is quite distinct from the preceding, and from the typical *septemlobum*; the leaves being of a soft pale green, with the apex of the lobes tinted with rose when first developed—the lobes are linear, with the margins lacinate. *A. polymorphum decompositum* has the rind of the young shoots of a bright reddish-crimson, and the foliage a soft fulvous green, showing a pleasing contrast to the more showy colour of the shoots. The leaves are generally 5-lobed, very unequally cut, and variable in form. *A. p. ampelopsisifolium* is another telling variety, with foliage showing varied tints from its development in spring to its fall in autumn, like those of the Virginian Climber. The leaves are about 3 inches across, 5 to 7-lobed, the lobes being elegantly cut at the edges, and terminating in a long point. *Cæsalpinia japonica* is a beautiful Japanese shrub, with leaves from 9 to 12 inches long; the inflorescence is a thyrsoid or sub-corymbose raceme as long as the leaves, and bearing from twenty to thirty bright canary-yellow flowers an inch in diameter, with which the red filaments and anthers form a striking contrast; the raceme remains fresh in water several days after being cut. *Clerodendron trichotomum* is a free-growing shrub, with erect stems and branches, forming in a few years a dense globose bush, 8 to 10 feet high, and as much through; it is clothed with bold dark green ovate-acuminate leaves, nearly 6 inches long. Its flowers appear in September, in the form of large terminal cymes; they are white, with a purplish calyx, and fragrant. *Magnolia Soulangeana nigra* is a fine introduction, belonging to the *M. conspicua* section, and perfectly hardy. The flowers are very much like those of the hybrid *M. Soulangeana*, but easily distinguished from them by the rich purplish hue of the outer petals. It is the darkest-flowered hardy *Magnolia* in cultivation. Like *M. Soulangeana*, the flowers appear in early spring in advance of the leaves, and, at that season, it is one of the most conspicuous as well as one of the grandest of garden ornaments. *Styrax japonica* is a charming shrub, of rather dense habit, from 8 to 12 feet in height, furnished with neat deep green foliage, and bearing simple racemes of sweet white flowers. *Cornus brachypoda* is a handsome deciduous tree, reaching a height of 30 feet, and quite unlike any other *Cornus* in cultivation. The flowers are produced in cymes about as large as those of the common Elder, but of a purer white; they appear in June, and project well beyond the foliage of the tabulated branches. *Eucryphia pinnatifolia* is another remarkably handsome half tree or big shrub, growing from 8 to 10 feet high in its native country—Chili. It is furnished with deep glossy green pinnate leaves, each of which consists of five ovate toothed leaflets, about an inch long. The flowers, produced from the axils of the upper leaves, are from 2½ to 3 inches in diameter, each with four pure white spreading petals, and numerous stamens with long filaments, terminating in bright golden yellow anthers. They resemble in form an *Hypericum*, and are produced in August. *Liquidambar styraciflua* is a small elegant North American aromatic tree of pyramidal outline, resembling the Maple in the leaves, excepting that they are alternate, and not opposite as in the latter, and that they assume more intensely brilliant tints in autumn.

THE HARDY FRUIT GARDEN.By H. MARKHAM, *Gardener, Mereworth Castle, Maidstone.*

APRICOTS.—Trees may now be planted in loam of a good depth, but not too rich, or an exuberant growth fraught with danger will result. Take care to put plenty of lime-rubbish and burnt earth with the staple. Apricot tree roots should not be often disturbed, but the trees should be surface-fed, and the borders slightly forked over, but not nearer than a point about 4 feet from the stems of the trees. Moor Park, Groesse Pêche, Blenheim, Hemskirk are varieties which should be included in every collection of Apricots.

PRUNING.—Now that the leaves have fallen from the trees, pruning may be taken in hand, beginning with those growing on northern and other cold aspects, so that it may be finished before wintry weather makes pruning unpleasant work.

MORELLO CHERRIES.—These should be the first kind of fruit begun, the pruning generally being almost identical with that pursued with Peaches. Take care not to leave the shoots too near to each other, for should once the trees become crowded with shoots, poor crops of fruit are almost a certainty; aim, therefore, at keeping the main branches equally balanced, well but not too abundantly furnished with fruiting wood. If the trees were loosened from the walls last year, and the main branches balanced, only those ligatures or shreds which clasp the branches and shoots tightly should be renewed, pruning them out where crowded. But should the tree require taking from the wall, remove carefully all the nails, pruning the tree as the work proceeds, freeing the wood from scale, if these pernicious insects are present, and the walls from moss. Proceed to fasten the main branches to the wall, filling in the open spaces with the best of the shoots. This done, the trees should be washed with weak soap-suds, and the borders being pricked over.

ORCHARDS.—During mild weather push on with the planting of fruit trees and bushes on heavy land, putting to each bush or tree a few shovelfuls of fine soil, so as to completely embed the roots. If the soil is very wet, the final trappings should be left till it is moderately dry. Orchard work will principally consist of pruning, thinning the heads, and manuring. Nut bushes should be left till the spring before pruning them. Orchard land where not turfed should not be dug, but only slightly pricked over, deep enough to bury weeds, and mulched with good manure.

THE ORCHID HOUSES.By H. A. BURBERRY, *Orchid Grower, Highbury, Birmingham.*

THE EAST-INDIAN HOUSE.—Such inmates of this structure as *Aërides*, *Saccolabiums*, *Cypripediums* of the niveum type, *Cœlogynes* of the warm-house, *Oncidium*, and *Odontoglossums*, will not be benefited if an over-exciting temperature is maintained. These plants should be carefully watered, not, however, keeping them so dry as to induce shrivelling of the pseudobulbs or the loss of leaves; neither must the atmosphere be arid, but the stages and floors should be moistened most days at night, and again in the morning, air being admitted when the weather is suitable for so doing. *Angraecums* showing flower spikes should be placed at the warmest part of the East-Indian house with the *Phalænopsis*.

REMARKS ON THE CULTURE OF INTERMEDIATE-HOUSE ORCHIDS.—A sharp eye must be kept on the plants at this season in order that each species may receive as nearly as is possible the treatment proper to it, it being so much easier to do the wrong thing at this season than in the summer when the plants are growing in their respective houses. For instance, some species of Orchids having finished up their pseudobulbs are now at rest; while others are more or less active. Those species which are roughly classed as intermediate, should not on that account be confined to one house the whole year; hence a good deal of labour in shifting them from one house to another is really necessary, if good results are to follow. I refer mainly to species which are shy to flower, and those that flourish and produce flowers in abundance for a short period only after they have been imported, and then rapidly decrease in size until they become worthless. Seeing how wide apart are the natural habitats of Orchids of the many species that we attempt to cultivate in one house, the wonder is, not why

they fail to continue strong and healthy, but rather how they grow even so well as they do under the same kind of treatment. Take, for instance, the *Cattleyas* that are made up; there should be put together in a cool airy house with moderately dry atmosphere. They will need very little water at the roots; but many are still only half made up, and these should be afforded more warmth to hasten growth. Then again, *Odontoglossum citrosum*, and *Cœlogyne cristata* should be kept dry and cool at this season; whilst *Miltonia vexillaria*, *Oncidium Weltoni*, and *Lycaste Skinneri* are growing actively, and they should be placed in a nice growing temperature of 60°. Then there are the other *Oncidiums*, such as *O. Forbesii*, *O. varicosum*, *O. crispum*, and others of the type, which should be rested cool and dry, and if along with *Dendrobium Wardianum* so much the better. A temperature of 40° to 50° would serve to impart vigour and strength to them, but not so with *O. Marshallianum*, *O. sarcoodes*, and other varieties pushing their flower-spikes. These plants need to have a growing temperature of 50° to 60°, as also *Anguloas*, *Cymbidiums*, and *Cypripediums*. *Trichopilias* should have the warmer end of the intermediate-house, too low a temperature and too much moisture at the roots produce a disease in the pseudobulbs of *Trichopilias*, which soon reduces the size of the plants.

THE KITCHEN GARDEN.By G. WYTHES, *Gardener, Syon House, Brentford.*

PEAS AND BEANS FOR EARLY CROPS.—The month of November is usually considered by those who raise their earliest crop from late sowings the best month in which to sow; but, owing to the general demand for large Peas at the commencement of the season, and the great loss attending the sowing of these from excess of moisture, and the low temperature, sowings in heat and on south borders are now generally adopted, but gardeners who have accommodation may sow in a warm frame, or in boxes or pots, in the early part of the year, and secure as early a crop as by sowing at this season in the open, and with rather less trouble, as the Broad Bean, when transplanted after being properly hardened-off, soon takes to the soil. It may here be remarked that Peas and Beans raised in mild heat, and not much forced, but allowed ample time to vegetate, succeed admirably; but the plants suffer greatly after planting out if they are not well protected by means of boards, straw hurdles, or evergreen branches. The Early Mazagan Bean was the kind formerly grown, but Beck's Dwarf Green Gem is superior to it, and very early, besides taking up but a small amount of space. It is also excellent when sown in pots early in the year, and planted out; and is equally hardy with the first-named. If it be sown at this season in deep drills, and these are only partly filled in, the plants are protected, in a measure, from the wind, and as soon as growth takes place, some of the soil may be drawn into the drills until finally the ground is made level. Longpods may be sown to succeed the dwarf Beans.

CABBAGES.—These are growing vigorously, but means must be taken to prevent injury by frosts, the quick-growing earliest planted Cabbages suffering more than the later plantings. To do this, some soil should be drawn up to the stems when the soil is workable, previously strewing wood-ashes along the rows before doing so, and make the soil firm about the plants by treading it, an operation that may, however, be inadvisable on heavy or clayey land, but is very essential on light ones. The stock of plants in the seed-beds should be pricked-off into rows at an early date.

THE SOWING OF PEAS.—Those who may possess a warm border may sow at about the present time in small quantities to furnish a few dishes in advance of the Peas sown in January in heat. A dwarf-growing Pea should be selected by preference, viz., Veitch's Extra Early, a first-class, good cropping Pea, which, sown now, will come into use towards the end of the month of May. Chelsea Gem is another quite as good, with larger pods, an extremely productive variety, but it should have a warm corner to itself, as it has some of the Marrow strain in it. For early sowing, this variety is decidedly the best Pea I have grown. A well-sloped border is best for Peas, and if a wall or other impervious shelter exists on the north or east side, so much the better. Much space between the rows is not required if dwarf varieties are sown, but space should be left for a row or two of Lettuce

in the centre between the rows. Birds and mice are sometimes troublesome, and the latter should be trapped, and the plants protected from the birds by netting or threads of cotton. It is a good practice to strew plenty of dry wood-ashes and a small quantity of soot along the rows. I mulch the land with spent Mushroom manure, which helps to retain warmth in it, and affords some small amount of nutriment. By dusting the plants over occasionally with wood-ashes, mildew is checked, and slugs kept at bay. For succeeding the varieties above-named, William I., Kentish Invicta, and Wm. Hurst are good, dwarf, early Peas. I do not advise the sowing of American Wonder, Chelsea Gem having superseded it.

CARDOONS.—Keep the plants protected if frost supervenes, and tie up any that are fit for blanching, winding hay-bands round them to keep the light away from the main stem. Plants fit for use may be lifted with a ball of soil, and placed in the root store.

CELERIAC, if not lifted, should have some tree leaves or litter strewn between the rows, first drawing the soil up to the crowns. The flavour is always best when the roots are left in the soil, if some kind of protection can be afforded them.

GLOBE ARTICHOKEs require some Mushroom-bed dung, litter, leaves, or coal-ashes placed around the crowns.

PLANTS UNDER GLASS.By R. MILNER, *Gardener, Penrice Castle, Swansea.*

MIGNONETTE.—When well grown, few plants are more appreciated during the winter months than Mignonette, *Keseda odorata*. Any plants singly or several together in pots, which are showing for bloom, should have the necessary support for the stems afforded; and when the pots become well filled with roots, to stimulate growth, a pinch of Thomson's plant manure should be sprinkled on the surface of the mould. All succession plants not in flower should be placed near the glass to avert the evil effects of spindling. The best place is a frost-proof brick pit or the shelf of a disused vinery, admitting air to them on every favourable occasion, and so to develop a robust short-jointed growth, and place one neat stick to each plant before it falls over.

HELIOTROPES.—Plants of these which have been growing in pots, and are intended for the embellishment of the conservatory during the early winter, will now need the assistance of supplies of weak manure water, or what is better in conservatories, &c., an artificial fertiliser. One or two neat sticks should be put to each plant, and the shoots lightly secured with neat ties.

FUCHSIAS.—The latest-struck batch of these plants will now be past their best, and may be gradually dried off. In the case of small and medium-sized plants, a place should be found for them beneath the greenhouse stage or similar place, where frost can be excluded.

EUPATORIUMS.—Plants of these species as fast as they go out of flower should be cut back to within 2 inches of this year's growth, previously withholding water for a few days, and after pruning, place them on a shelf near the glass in the greenhouse, or where they will be safe from frost. Eupatoriums need scarcely any water until they commence to break freely; and should aphids attack the young shoots, fumigate them without delay.

SAXIFRAGA PYRAMIDALIS.—A cool frame is the best place in which to grow this useful plant during the winter, keeping them within a few inches of the glass on a bed of coal-ashes, which is preferable to anything else for keeping these subjects in health, owing to the thorough drainage which it affords. On mild fine days, the lights should be drawn off altogether, tilting the same by night when there is no danger of frosts. Avoid the necessity to afford much water at this season, dampness of the soil or air being very injurious.

VIOLETS.—Those growing in pits or frames should be examined once a week, and all decayed leaves removed; and on fine mild days the lights may be drawn off the frames, replacing them on the least sign of frost at night. If slugs are troublesome, a few Cabbage leaves should be placed between the plants, and examined every evening about 8 P.M., and in the early morning. A sprinkling of dry wood-ashes is effectual in freeing Violets from slugs.

SHOW.

TUESDAY, Nov. 22—Dalkey Chrysanthemum.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—41° 6.

SIR JOHN LUBBOCK'S recently-issued work on Seedlings* truly comes under DE CANDOLLE'S definition of "a book," for in it the descriptions of various forms are classified, discussed, and made the basis of logical inference. In its way, we can think of nothing fairly comparable to it except GERTNER'S classical work, entitled *De Fructibus et Semibus Plantarum*, which, although it is a century old, is still constantly referred to for facts and details, and will be so for many years to come. A similar long period of utility, we venture to think, will be experienced by SIR JOHN LUBBOCK'S book. It forms two bulky volumes, each of more than 600 pages, of orderly-arranged text, illustrated by no fewer than 684 woodcuts, with a bibliography filling some forty pages, and a double-column index, filling yet seventeen more pages. There is no doubt, then, that as to form, SIR JOHN LUBBOCK'S work amply fulfils the requirements which DE CANDOLLE lays down as to what a book should be. The subject, it is known, has long occupied the attention of its versatile and accomplished author. Communications to the Linnean Society, as well as separate publications, have paved the way for this imposing treatise. Indeed, the Introduction to the present volumes is constituted by a reprint of portions of some of these papers. In it the author discusses the general form and appearance of seedling plants, and of their cotyledons, the general conclusion being arrived at that the form of the embryo and that of the cotyledons are dependent on that of the seed, the seeds themselves being constructed with reference to the habits and conditions of the plant. The main differences in the seedling, we may here point out, are connected with its development beneath or above ground, and are dependent on the degree and kind of development of the internode below the cotyledon—the so-called "hypocotyl" (a new word for caulicle or tigellum), and of that of the internode above the cotyledons—the plumule. Further differences depend on the nature and form of the cotyledons themselves, on the presence or absence of axillary buds, and so forth. Generally, the cotyledons serve only a temporary purpose, and do not greatly alter in appearance after their first formation; but SIR JOHN LUBBOCK gives some very curious illustrations in *Oenothera*, where the base of the cotyledon continues to grow, and to assume the form and characteristics of the adult leaves.

After an introduction devoted to the general morphology of the seedling, the special morphology of the embryo plant as seen in the various orders of flowering plants is dealt with, beginning with Ranunculaceae and ending with the Grasses. In the first place, a general account of the fruit, seed, and seedling of each order is given, and then particular details are afforded referring to illustrative genera and species. Of course, some orders and some genera are much more fully represented than others, not that they are intrinsically more important, but because material

is much more easily accessible in some cases than in others. Plants cultivated in gardens have naturally furnished the bulk of the material, although the inadequate representation of some orders such as Palms and Orchids, cannot be attributed to any lack of available material.

No botanist will need reminding of the great interest attaching to certain anomalous forms of germination like that of some *Delphiniums* and *Umbellifers*, of *Corydalis*, of *Tropeolum*, *Dodecatheon*, *Cyclamen*, *Trapa*, *Araucarias*, or others, but all will owe SIR JOHN LUBBOCK a debt of gratitude for the vast number of illustrations he has brought together. They are brought together, too, in a form admitting of easy reference and comparison, presenting in this way an admirable contrast to many modern text-books, more especially German ones, excellent, it may be, in substance, but detestable and time-wasting in form.

The account given of the germination of *Testudinaria elephantipes*, and of which, thanks to MR. WATSON, we give an original illustration (fig. 93) may be taken as a sample of the style of the book:—

"The cotyledon remains in the seed after germination till it decays. The hypocotyl is subterranean, very short, and develops in the early stages of the seedling into an ovoid fleshy tuber. The first leaf is comparatively large, cordate, and somewhat reticulate, with five strong nerves radiating from the base, and becoming curved at their tips. The persistent root-stock or stem ultimately becomes a woody, flattened, globose, or conical mass, rather deeply fissured in a reticulate manner, presenting the appearance of the shell of a tortoise.

"Primary root elongated, flexuose, stout, with fibrous lateral rootlets.

"Hypocotyl very short, subterranean, thickening into a fleshy, ovate tuber, generally, if not always, rootless during the earlier stages of growth.

"Cotyledon subterranean, remaining in the seed, and fusing with or closely adhering to the endosperm, where it remains till decay.

"Stem undeveloped in the early stages of the seedling.

"Leaves simple, entire, radical or cauline, alternate, exstipulate, petiolate, glabrous, reticulated, with the principal nerves radiating from the base, and becoming incurved upwards.

"[Leaf] No. 1°, cordate, subacutely cuspidate, with five strong leading nerves radiating from the base, and two weaker branches from the basal pair."

SIR JOHN shows how, as a descriptive naturalist, he has been influenced by the sound methods of LINNÆUS, whilst as an evolutionist he understands the true meaning of a natural system. The appearances of the seedling plant not improbably represent some of the phases of ancestral structure, and in any case they afford very interesting intermediate gradations between the infantile and the adult condition, not only as regards their external form, but as to their internal anatomy also.

To the physiologist, the seedlings are also very interesting, being sometimes calculated to fight their own battle from the first, whilst in others they are for a time more or less dependent on neighbouring parts for sustenance. From this it is obvious that, from a practical point of view, the study of seedlings and their mode of life is essential to the cultivator; indeed, gardeners, farmers, and especially seedsmen, will find SIR JOHN LUBBOCK'S book a useful one for reference. Young gardeners and amateurs desirous of undertaking some useful work might take it as a foundation, and add to it almost *ad infinitum*, according to the measure of their opportunities. The observations required are such as almost anyone could compass, not necessitating costly

or intricate apparatus, or demanding any special aptitude on the part of the observer.

It is obvious that no one man, even if he could devote his whole time to the business, could hope to complete such a book as this within a reasonable time without assistance; least of all a man with so many and such diversified calls upon his time as SIR JOHN LUBBOCK. The author accordingly cordially acknowledges the services of MR. HENNY, who has drawn many of the figures; of MR. FRASER, who collected, grew, and noted the characters of many of the plants; and of MR. RENDLE and SIR JOSEPH HOOKER, who rendered assistance in looking through the press.

We trust we shall not be considered either ungracious or hypercritical if, while thankfully acknowledging the great value of the bibliographical references, we add that they might, with advantage, have been considerably extended. We fail, for instance, to find any references to the curious mode of germination of *Sechium edule*, to the intracarpellary germination which often takes place in *Citrus*, *Melons*, *Carica* (figs. 91 and 92), and in *Pernettya*; to the numerous figures given by BARON SIR FERDINAND VON MUELLEN, showing the process of germination in the species of *Eucalyptus*; to the curious case of *Tropeolum*, studied many years since by MR. DYER (see *Gardeners' Chronicle*, 1872, p. 218); to the beautiful plate showing the germination of different species of *Crocus*, by MR. MAW; to the numerous seedling *Primulas* figured in these columns at the time of the *Primula Conference*, and published also in the *Journal of the Royal Horticultural Society* in 1887; to the noteworthy modes of germination in various species of *Araucaria*; to the numerous figures of seedling *Orchids* given by MR. HARRY VEITCH in his admirable paper on the Hybridisation of *Orchids* at the *Orchid Conference* of May, 1885; to the memoirs of M. DUCHANTRE on the germination of *Lilies*, or that of his son, on the development of the seedling in tuberous *Begonias*. A search through the principal monographs, such for instance, as those of the *Flora Brasiliensis*, would assuredly bring many more interesting examples to light. These and other omissions do not impair the value of what is in its way truly a noble monograph, though modestly styled "a contribution;" and, moreover, they can readily be supplied hereafter.

ROYAL HORTICULTURAL SOCIETY.—The publication in our columns lately of the scheme of examination in horticulture of the Royal Horticultural Society has, we learn, overwhelmed the Secretary with letters, and he is desirous of having it stated that correspondents would facilitate replies, and lessen their cost to the Society, if they would kindly send a ready-stamped and directed envelope with their communications!

THE GARDENERS' ROYAL BENEVOLENT.—The fifty-third festival dinner in connection with the above charity was given on Tuesday evening, November 15, at the Whitehall Rooms of the *Hôtel Métropole*, LORD BRASSEY, K.C.B., in the chair. His lordship was supported by a large number of well-known professional and amateur gardeners, as well as others who take a practical interest in the welfare of the Society. After dinner, the usual loyal and patriotic toasts having been proposed, LORD BRASSEY gave with great warmth the toast of the evening—"Continued Success and Prosperity to the Gardeners' Royal Benevolent Institution, now in its fifty-third year, coupled with the name of MR. HARRY J. VEITCH, Treasurer. His Lordship, in the course of his interesting speech

* A Contribution to our Knowledge of Seedlings, by the Right Hon. Sir John Lubbock, Bart., M.P., &c. with 684 figures in the text. Two vols. 8vo. (Kegan Paul, Trench, Trübner & Co.)

THE GARDENS OF THE ALCAZAR, SEVILLE.

said that the main feature of the Society was that, while it administered to the relief of those who were in distress, it sought by every means in its power to inculcate the virtues of providence and economy. At the present time they had 156 pensioners, of whom 79 were men and 77 women, at a yearly expenditure of £2700. He was sorry to tell them that there were 31 candidates waiting to receive the benefits of the institution; he therefore hoped that they would do their best to increase the funds of the society. In urging his hearers to extend their liberality to the fund, his lordship said he might appropriately appeal to their grateful recollections of the happy hours they had passed in gardens. England bore through all its length and breadth the marks of care and skill in its farms, its parks, and pleasant places, and in its innumerable gardens, both large and small. The debt they owed to those by whose labours so many scenes of enchantment had been created was great, and he hoped that debt would be in some degree repaid by their collection that evening. Mr. Harry Veitch, in replying, thanked Lord Brassey for his very enthusiastic appeal on behalf of the Society. The working expenses of the Society had been kept down as much as possible, having been reduced from 25 per cent. in 1888 to less than 13 per cent. Lord Addington proposed "The Royal Horticultural and Botanic Societies of London and the United Kingdom," to which Sir Trevor Lawrence, Bart., replied. The Rev. W. Wilks, M.A., gave "The Stewards and Donors," Mr. H. E. Milner replying in their behalf. The secretary, during the evening, announced subscriptions to the amount of £1400, including from the chairman 50 guineas; Lord Rothschild, 100 guineas; Mr. Howard Morley, £25; Sir T. Lawrence, 10 guineas; Baron Schroder, 30 guineas; Sir Julian Goldsmid, 20 guineas; and the Skinners' Company, 10 guineas.

COUNTY COUNCIL LECTURES—Mr. ROBERT SMITH, the head-gardener at Kenward, Yalding, Kent, has been chosen for the post of Lecturer on Horticulture, by the Technical Education Committee of the county of Salop. Mr. SMITH is well known as the author of several valuable treatises on fruit growing.

SUPERINTENDENCE OF LONDON PARKS.—At a meeting of the London County Council on the 15th inst., it was resolved that Mr. J. J. SEXBY of the Architects' Office, be made chief officer of the Parks and Open Spaces Sub-Department, at a salary of £500 a-year; and that Mr. NAIRN be appointed chief clerk, at a salary of £400 a-year.

EXPERIMENTS COMMITTEE, KENT COUNTY COUNCIL.—A well-attended meeting took place on Thursday, November 10, at the Horticultural College, Swanley. The report of the Potato experiments was read, and during a further discussion upon it, the fact was mentioned that although in these trials treacle and molasses apparently had no effect in retaining the copper-sulphate and lime on the foliage, yet in other experiments sugar had been used for this purpose and had been found beneficial against Potato fungus. Report.—The Secretary reported that in order to test varieties of Strawberries suitable for cultivation in the field for market, five different sorts had been obtained from Canada, sixteen from the United States, and twenty-two from Mr. LAXTON, Bedford, these had been duly planted. The American plants suffered in transit. Referring to the trial of manures on Broccoli: the plots treated with kainit at 3 cwt. per acre, and the nitrate of soda at 2 cwt., were still the best. The Cauliflowers manured with Manchester manure were considered to have given better results than those manured with Peruvian guano. The discussion on fruit evaporating having been resumed, Mr. TILL offered the use of his large evaporator to the College next year, if the committee would supervise trials with it, to test whether evaporation is an economic process of utilising fruit when prices are low. The committee hope before the next meeting to obtain particulars of drying fruit in Hop-kilns, by hot-air and steam. The following report of the two soils taken for

analyses by Mr. HORACE CHESHIRE was read and explained:—

"Report on Analyses of Two Soils at the Horticultural College, Swanley, North-west Kent, the one lying over the chalk, the other over the Thanet Sands, made by H. F. CHESHIRE, of Hastings, October 20, 1892. No. 1. Is a chalky soil with a very hard chalk subsoil at about 10 inches down. It contains a large quantity of sand, and would of course be benefited by the admixture of clay if practicable. No. 2. Is a very sandy soil, and though it contains a good deal of iron, has that iron in a rather insoluble form, so that it might often be necessary to add soluble iron salts with crops requiring a rapid supply of that substance. Some of the iron also being in a ferrous condition, seems to show the necessity for plenty of tillage. Again, an admixture of clay is desirable. Both soils are very deficient in potash, and containing as they do a rather large quantity of insoluble matter, would be liable to early exhaustion; but I see no reason why both should not be very productive if intelligently treated."

BOTANIC GARDEN, GRANADA.—Mr. G. WHITFIELD SMITH's report for the year 1891, a copy of which has just reached us, is an interesting document, as showing the great progress made within a comparatively recent time in the development of the garden which dates only from 1886. It is 15 acres in extent, and is of course largely devoted to the cultivation of economic plants as alternatives for sugar. The island seems specially well-adapted for Coffee-planting, the culture of Pine-apples, Mangos, Nutmegs, and other tropical products.

HORTICULTURAL CONGRESS AT CHICAGO.—The date fixed for this gathering is August 16 and three days following. The Society of American Florists, the American Seed Trade Association, and the American Pomological Society will hold their meetings in the same city during the same month.

DISCHIDIA RAFFLESIANA.—In the days when outward form was more considered than microscopic anatomy, there were few things which attracted the attention of the students of the text-books of those days more than the figure of this singular pitcher-plant, but no one in this country had a chance of seeing it. Now, as we learn from the *Kew Bulletin*, it is in cultivation in one of the propagating pits, and is under the observation of Dr. SCOTT, the Hon. Keeper of the Jodrell Laboratory, from whom in due course we may expect a valuable report.

BELGIAN APPLES.—It is time our Kentish farmers waked up. From Tongres, and from Saint Trond, so we are told by the *Illustration Horticole*, special trains three times a week have been laden with Apples, mostly destined for the English market. Surely the climate of Belgium is not superior to our own.

TRACHELIUM CÆRULEUM.—Writing in the *Journal of Botany*, Mr. J. COSMO MELVILLE announces the occurrence in the island of Guernsey, in a naturalised condition, of this plant. It is said to grow on old high walls near St. Peter's Port.

TECHNICAL EDUCATION IN HORTICULTURE.—The Council of the Scottish Horticultural Association having been allocated a portion of the residue grant by the Town Council of the City of Edinburgh, has arranged a course of lectures, to be delivered during the ensuing winter and spring. The scientific and practical aspects of the subjects chosen will be treated of by eminent authorities, and the lectures will be free to all interested in the advancement of horticulture. This being the first time that such a course of lectures has been given in Scotland, and looking to the importance of the subject from a commercial point of view, it is to be trusted it will be well taken advantage of by the general public. Bursaries will be given to successful competitors, who must have attended three-fourths of the lectures, and must be under-gardeners or nurserymen, and approved of by the Council. Intending competitors should intimate such, in writing, to the

Hon. Secretary at the beginning of the session, and not later than December 1.

SYLLABUS.

In Surgeon's Hall, Nicolson Street.

1892: Nov. 23, 30, Dec. 7, 14.—"The Chemistry of Plants and Soils," by Mr. W. IVISON MACADAM, F.R.S.E., F.I.C., F.C.S., &c.

In Dowell's Rooms, 18, George Street.

1892: Dec. 19, 28. 1893: Jan. 4, 12.—"The Structure and Physiology of Cultivated Plants," by Mr. A. N. MACALPINE, Consulting Botanist to the Highland and Agricultural Society.

Jan. 18, 25, Feb. 1, 8.—"The Hybridisation, Selection, and Improvement of Plants," by Mr. JOHN H. WILSON, D.Sc., F.R.S.E.

HARDY FRUITS.

Feb. 15.—Introductory Lecture, by Mr. A. F. BARRON, Superintendent, Royal Horticultural Society's Garden, Chiswick.

Feb. 22.—"Apples," by Mr. DUNN, Dalkeith.

March 1.—"Apricots and Cherries," by Mr. TEMPLE, Carron House, Falkirk.

March 8.—"Peaches and Nectarines," by Mr. FAIRGRIEVE, Dunkeld.

March 15.—"Plums," by Mr. DUNN, Dalkeith.

March 22.—"Strawberries," by Mr. TEMPLE, Carron House, Falkirk.

March 29.—"Pears," by Mr. M'KINNON, Scone Palace, Perth.

April 5.—"Gooseberries, Currants, and Raspberries."

The lectures will commence at 7.30 each evening. Mr. ROBERT LAIRD, 17, South Frederick Street, Edinburgh, is the Hon. Secretary.

PICEA BREWERIANA (see *Gardeners' Chronicle*, April 17, 1886, fig. 93).—Four score years have not sufficed to chill the enthusiasm or curb the enterprise of the veteran ROBERT DOUGLAS, who has been making a trip on horseback over the Siskiyou Mountains to visit the famous Weeping Spruce (*Picea Breweriana*). In a private letter he writes of this tree that, "to appreciate its appearance, one must imagine a Norway Spruce from 100 to 130 feet high, and 3 feet in diameter breast-high, with branchlets set thick together along each branch, and hanging straight down sometimes to a length of 6 feet, although no larger than a lead-pencil at the point where they leave the limb." From a small twig which he kindly sent, the foliage seems to be better than that of the Norway Spruce, not so long, but wider and thicker, and of a lighter and more cheerful green. The cones, before they open, are about as large as a man's middle finger. The seeds are small, although a trifle larger than those of the White Spruce, and Mr. DOUGLAS estimates about 50,000 seeds to the pound. Several persons have tried to collect these seeds, but, so far as we know, Mr. DOUGLAS was the first one to gather them, at least in any quantity. The trees stand on the steep mountain-side, and the cones are all on the very topmost branches of the tree, and more than 100 feet from the ground. In prospecting about this vicinity, Mr. DOUGLAS found a few trees that had not been discovered, so that in this station there are about a hundred full-grown trees. Standing where the snow lies over more than one-half of the year, and where the cold is very severe, they should be able to endure the severest eastern winters, although it is doubtful whether they would stand in a very dry atmosphere. *Garden and Forest*.

COFFEE IN BRITISH HONDURAS.—The climate of this colony would seem to be at least as well adapted to the cultivation of Coffee as that of the neighbouring Republic of Guatemala. Accordingly, the *Kew Bulletin*, which apparently overlooks nothing in the way of economic botany and the development of the resources of our colonies, devotes a long article to the subject. The want of roads, and the deficiency of labour, are at present the chief drawbacks.

THE PRUNE INDUSTRY OF CALIFORNIA.—The *Kew Bulletin* for November contains a full account of the Prune industry in California, with a

coloured figure of the Plum used (Prune d'Agen). Full details are given as to the mode of culture and preparation of the fruit.

CATALOGUES.—As a rule, it is obviously not possible for us to do more than announce the fact that a particular catalogue has been published. Occasionally special reasons render a fuller notice desirable, and we now beg to mention as worthy the attention of importers, J. P. ANRAHAM'S Catalogue of Tropical Plants, Seeds, &c., Colombo, Ceylon; the descriptive Catalogue issued by the Yokohama Gardeners' Association, 21, Nakamura, Yokohama, and the Catalogue of the Native Plants of the Southern Alleghany Mountains, Harlan, Kelsey, Linville, North Carolina. All these contain plants not usually met with in trade lists.

"FANCY BEDDING."—Visitors to the Great Exhibition at Chicago next year will, in all probability, have the opportunity of seeing some choice specimens. Judging from some recent illustrations, our Yankee friends whip creation in the construction of these "fancy beds." For excruciating atrocity we have seen nothing to compare with some specimens figured as adorning (?) some of the parks in Chicago. Evidently there is a large public even for such things. Our own parks still show it.

MR. BLAIR.—We learn that Mr. BLAIR, gardener to the Duke of SUTHERLAND, has reconsidered his decision, and will remain as Head Gardener at Trentham, instead of becoming landlord of the Trentham Hotel, as he had intended. The present Duke and Duchess are both great lovers of flowers, and will probably take a great interest in the gardens at Trentham, which will soon vie with the Trentham of former years.

CERISE A COURTE QUEUE—SHORT-STALKED CHERRY.—Under this name, M. BURVENICH figures and describes in the *Bulletin d'Arboriculture, &c.*, for October a Cherry. It is like the Flemish Cherry, and is, we are told, largely grown for market purposes in Belgium. Large quantities are sent to Paris and to London, as well as to the Belgian and Dutch sea-side resorts in August. Dr. HOGG, in his invaluable *Fruit Manual*, ed. 4, p. 207, adopts the name Gros Gobet for this variety, and adds a string of French and German synonyms. This list of aliases, as well as the statement of M. BURVENICH that he finds slight differences between the French and the Belgian forms, enable us to reconcile the conflicting statements as to quality and date of fruiting, for, while M. BURVENICH lauds it as very agreeable, "rafrachissant," Dr. HOGG says it is only fit for preserving. M. BURVENICH speaks of the tree as very productive, suitable for cultivation in private establishments and for markets; whilst Dr. HOGG says, "The tree is an indifferent bearer, and an that account is almost out of cultivation." We have no doubt both authorities are right from their own standpoint. The discrepancy, however, shows the necessity for accurate illustrations, or better still, models. In botany, it is generally possible to verify synonyms by comparison with authentic specimens preserved in herbaria; but in pomology this is much more difficult, as specimens are rarely preserved, and the identification of synonyms is, for the most part, pure guess-work. Some one starts the conjecture with more or less plausibility, his successors adopt the suggestion, often without acknowledgment, and next to never with any independent attempt at verification, even where it might be possible. Synonyms are a great burden in botany, but at any rate a monographer takes every possible pains to verify the references he quotes by a comparison of all available material; if he does not, he is not conscientious, and his fellows know what estimate to put upon his work. A series of plates of selected varieties, authenticated by a congress of pomologists, would be a great boon, and as only a select few varieties need be thus illustrated, such a work ought not to be beyond hope of realisation. The *Herefordshire Pomona* is altogether admirable, so far as it goes, but it is not everyone who can

indulge in the purchase of so costly a work. Meanwhile, it may be consulted in the Lindley Library.

THE PRODUCTION OF HOPS.—The table shows the estimated total production of Hops in the years 1892 and 1891, with the acreage and estimated average yield per statute acre, in each county in England in which Hops were grown:—

COUNTIES.	Estimated Total Produce.		Acreage.		Estimated Average Yield per Acre.	
	1892.	1891.	1892.	1891.	1892.	1891.
	Cwts.	Cwts.	Acres.	Acres.	Cwts.	Cwts.
BERKS	65	77	10	11	6 50	7 00
GLOSTER	206	180	39	25	5 28	5 20
HANTS	17,221	13,793	2,775	2,749	6 21	5 02
HEREFORD	45,213	44,170	6,797	6,560	6 65	6 73
KENT	258,431	271,347	34,058	34,266	7 59	7 92
NOTTS	35	20	14	14	2 50	1 43
SALOP	648	577	117	112	5 52	5 15
SUFFOLK	5	118	18	20	0 28	5 90
SURREY	9,028	14,212	1,938	1,955	4 66	7 27
SUSSEX	61,170	67,861	7,124	7,150	8 59	9 49
WORCESTER	21,239	24,411	3,369	3,280	6 39	7 44
Total	413,259	436,716	56,259	56,112	7 35	7 78

Note.—As the above preliminary estimate is issued at the earliest possible moment after receipt of the particulars, it is necessarily subject to correction in the Annual Produce Statistics, *Board of Agriculture, November, 1892.*

OXFORD BOTANIC GARDEN.—The question—Who was the first curator or head-gardener?—has again arisen. By some the elder TRADESCANT is supposed to have held the office. In reference to this opinion, we cite the following passage from INGRAM'S *Memorials of Oxford*, vol. iii., Art. "Botanic Garden":—"After the completion of the walls and archway in 1633, the garden is said to have been stocked with various medicinal plants; and JOHN TRADESCANT, the Elder . . . was appointed gardener. It is not certain, however, that this individual ever actually accepted the office, or took up his abode at Oxford in consequence; at any rate, his services there were of short duration, since he died in the year 1638, within six years from the establishment of the garden." We think the question may be set at rest by the record on the monument to BOBART in the churchyard of St. Peter-in-the-East, Oxford, and cited in DRUCE'S excellent *Flora of Oxfordshire*, p. 374. We quote sufficient for our purpose:—

To the Pious Memory of JACOB BOBART,
A native German,
A man of Great Integrity,
Chosen by the Founder to be Keeper of the
Physic Garden.
He died, Feby the 4th, 1679, in the 81st
Year of his Age.

A NEW BELGIAN CHRYSANTHEMUM SOCIETY.—A society has just been founded in Brussels, under the title of the Société des Chrysanthémophiles. The work undertaken by it, the promotion of knowledge concerning the culture, propagation, hybridisation, diseases, and insect-foes of Chrysanthemums. The President is the well-known amateur, M. F. DE LOMBAERDE; the Secretary, M. FRANÇOIS PEETERS.

TEA FROM NATAL.—We duly chronicled the fact at the time when last season South African tea was offered at Mincing Lane, that some 12,000 lb. from Natal had found purchasers at what we supposed was a remunerative price. Whatever the nett receipts by the producers, it has given encouragement sufficient to warrant a more heroic effort for the season now coming on, for we learn, on the highest authority, that over half a million—500,000—pounds of tea will be offered in London for public competition. We do not hear that any improvement has been effected in curing the leaf, the necessity for which was pointed out at the time, and as this is stated to have affected the price paid at

the sale, one would have thought the experience paid for would have had a different result. They are easy-going folks in the colony—whose jubilee will be celebrated next year—but things might be made even more easy than they are if just a trifle more enterprise were shown in these early days of tea marketing.

BONES AS A BUILDING MATERIAL.—The following interesting letter occurs in the *Builder* of the 5th inst.:—"In the Churchwardens' account of Kirkby Wharfe, Yorkshire, for 1704, is an item for 'Sheepshanks for hanging ye tiles, 2s. 6d.' They were cut into pegs, and would be everlasting; some were found in their places in 1860. I cannot get a sight of any, but I have reason to think that their use was common. What is known of this material? In PETER KALM'S account of his visit to England in 1748, this Swedish observer describes walls or fences in common use near London to separate meadows, market-gardens, &c., built of the cores of ox-horns, to each of which was attached part of the skull. In the best work they were put in layers as close as they could be packed, the points inward; a 6-inch layer of earth was put between each layer of cores. The length was 4 feet, and the width the same. This disciple of LINNÆUS notes half-a-dozen plants, such as *Convolvulus* and wall Barley, that covered the top. Slighter fences tapered to a narrower top. Are any such fences remembered? KALM also notices that these cores were carted out on the high roads and there spread, earth and sand being laid on them, which made the road firm and durable. Is our term, 'hard core,' applied to clinkers, &c., a survival from this use? KALM saw where a gentleman had set the leg-bones of oxen and horses in the ground as edges to his flower-beds, sticking them close together, the transversal end downwards and the round curled end upwards (to keep the earth from rolling down on the path), as he had seen also near Moscow. Here is a fresh item, I think, for the formal garden. The grotto in Wanstead Park (recently burnt out) was paved with sheep-shank bones, laid in patterns—conducive to corns, one would expect; but they would tally with the ornamental pavements of small round pebbles, common in old summer-houses, but now amongst the lost arts. Bones, and particularly those which, like the cores, were not used in manufactures, would accumulate; but when their use in manure or in chemical works became known, they would cease to be applied to road-making and fencing.

"THOS. BLASHILL."

HOME CORRESPONDENCE.

OXFORD, AND ITS GARDENS.—I read with interest your article at p. 551 on "Oxford, and its Gardens." I fully agree with all your correspondent says respecting the dilapidated state of the Botanic Garden, but surely he cannot lay it all at the door of the University. I visited the garden lately, and noticed with regret the "assortment" of plants there cultivated. On every hand plants of *Dianthus caryophyllus* in variety met the eye; *Viola tricolor* in variety also were largely represented. I have always been under the impression that a botanic garden is kept for the sole purpose of studying botany and learning, but the plants above-named can be studied in any private garden in the kingdom. Fully one-third of the plants outside are without labels, and on some of the labels the names are quite illegible, on others partly obliterated. There are also a great

many labels without a plant, or even an apology for one, behind them. I was told on my first visit that the public were not admitted to the houses, but from what I could discern by looking through the glass, they compared very favourably with the outside show. I noticed a good stock of mealy-bug in the house devoted to the Cacti. I thought it a great pity that such a good collection should get thus. In another house, Tomatos were strongly represented in number, though growing weakly. Your correspondent "Tradescantia" says the "Dons" are thinking of doing away with the garden. Perhaps they, like myself, have noticed the great tendency there is to grow common garden plants instead of botanical specimens. A well-ordered and kept garden is always a thing of pleasure, but who would be troubled to keep a bad one. I am making these few remarks on what I myself observed, and I hope there will be something done before long for the sake of men who, like myself, go there hoping to see something interesting, but who come away disappointed. *Botanist.*

THE CURARE POISON OF THE SOUTH AMERICAN INDIANS.

Concerning this poison, lately referred to in the public press, on the subject of vivisection, I take the liberty to make a few remarks, having lived and travelled for a number of years among various of the Indian tribes who made and employed it in hunting. Curare, called by some of the tribes, urary, is prepared from a climber, a species of *Strychnos*, tobacco leaves, and the strongest or hottest *Capsicum* fruits that can be procured. Portions of these plants are bruised, and put into a large earthenware pot, with water which on boiling, is set down and allowed to macerate for several days beside the fire. The contents are then strained and pressed, and the remaining watery solution is slowly boiled down until it acquires a thick consistency, when on cooling, it becomes firm and black, and looks like a piece of shoemaker's wax or opium. Exposure to the air for any length of time is thought to diminish its active properties. The Indians, therefore, without delay, make it up into little balls about the size of a rifle bullet. Each of these is then rolled up in leaves and put into a jointed bamboo, which is carefully stoppered, so as to exclude the air. There is no doubt various tribes add other plants besides those just noted, whilst the method of preparation may vary in some respects. A branch of the warlike tribe Paéz, inhabiting the Eastern Andes, among whom I lived for some time, included besides those plants already mentioned, a Pentstemon-like plant, locally known as the "Gumbia poison," a plant possessing a powerful principle; it was said that if a single dried powdered leaf was given to a dog, "it would never bark again." The plant is met with in shady forests, and belongs to the same order as the *Strychnos* family, Loganiaceæ. On passing through the city of Quito, I gave dried specimens of it to the late Dr. Jameson, then Professor of Botany at the University there, who earnestly desired it for the use of his botanical class. The curare is applied by merely holding it for a few moments near to the fire to soften it; the points of the arrows are then turned in it, and placed in a sort of sheath. When a parrot or other large forest bird is pierced by an arrow from the blowpipe, it gives a momentary shiver, and comes down like a clod. The same sometimes happens with a monkey, though it frequently takes two or three arrows to bring this animal to the ground. Even then it may not be dead, though, of course, it is perfectly powerless. I constantly noticed that the appearance of the eyes of the monkey when not dead seemed to indicate some sort of painful suffering or wretchedness, and on one occasion I called the attention of the blowpipe Indian to this circumstance. His only reply was two or three swift blows to the unfortunate animal, which of course, killed it at once. The way in which those Indian tribes have learned the uses of certain plants has been ascribed to their possession of a sort of instinct. It may, however, be assumed that the knowledge possessed by them of the medicinal and other properties of plants specially suited to their wants has been handed down by the early widespread nations which at one time must have peopled many districts of South America, whose ruined Cyclopean towers, temples, and other buildings now overgrown by dense forests are older than the pyramids. *Robert Cross, Victor Park, Corstorphine.*

THE PROPOSED EXAMINATION IN HORTICULTURE.—I have found in the districts which I have worked so far in the county of Surrey, considerable interest evinced in the proposed examinations in

horticulture, which the Royal Horticultural Society will hold next May. It is commonly said "We hope to present a few candidates," and I have urged any such that may propose to sit, to utilise all their spare time between now and next May to work up theoretical knowledge from books, as with the insight into various aspects of gardening which lectures have presented, there ought to be found in books very much more of interest than there would otherwise have been. It is a pity that for the purpose named we have not a series of text books that are cheap, and therefore easy of access to all intending candidates. Books that range from 1s. to 2s. 6d. each, if of really authoritative character, would be doubtless largely purchased, but it is useless to expect that ordinary attendants at technical education lectures, or members of gardeners' or similar associations, can obtain books, ranging in value from 5s. to 25s., and in how very few instances are such books available in libraries, even if the libraries were accessible. Take vegetable culture, for instance: books like Vilmorin's *Vegetable Garden*, Sutton's *Vegetable Culture and Enemies*, Shaw's *Market Gardening*, &c., are all too costly for the rank and file of intending candidates, and very cheap books are hardly worth purchasing, except when they treat upon some special topic, such as Mushrooms, Tomatos, &c. Gardening, too, is such a progressive science that a book ten years old, so far as relates to practice and varieties, seems to be getting out of date. Of course, the principles on which sound practice is based remain the same, but practice differs materially as time rolls on. The difficulty which presents itself in regard to the recommendation of suitable books to candidates, that are not too expensive, is considerable, and would be well could it be overcome. *A. D.* [We trust our correspondent will not continue to recommend his pupils to "work up theoretical knowledge from books." This is most undesirable, and we hope and believe the examiners will do their duty, and discourage all such useless cramming. If by theory our correspondent means reasonable explanation of the structure and uses of plants, and of the operations connected with their cultivation, then, by all means, let him counsel the reference to books as exponents of practice, but not otherwise. *Ed.*]

AUTUMN-SOWN PEAS.—I notice a correspondent, p. 586, holds forth on the merits of autumn-sown Peas. I have for the past few years been an advocate for spring sowing in preference to autumn sowing, as it does away with much labour and anxiety, and in the end there is a better crop. I know there are many growers who adopt autumn sowing, and I believe many more who do not sow till spring. For instance, from a sowing made upon a south border on January 27, of English Wonder and Chelsea Gem, we picked Peas on June 8 and 13 respectively, and had good crops of them; whereas some Peas were sown in another garden close by early in November, and from a few ragged rows these were gathered on July 13. This result had been achieved after several hours spent in slug catching, &c., spreading wood-ashes and soot along the rows after almost every heavy rainfall. We on the other hand, were saved all this trouble by not sowing till spring. It may be that Peas sown in the autumn may do better upon soils of a somewhat lighter description than ours, which is very cold and heavy. Nevertheless, our Peas do well, and we can grow them good enough for exhibition anywhere; and so long as Peas can be gathered early by spring sowing, we shall not fall back on autumn sowing. It is found that for early Peas much strong manure is not required, a good dressing of wood-ashes or burnt refuse being better fertilisers, and not causing rank growth but sturdy haulms; and after the crop is cleared off, the plot of ground is good for Tomatos, Lettuce, or Horn Carrots. *W. A. C., Compton Bassett.*

COMMON GARDEN INSECTS.—Your correspondent should take a course of lessons in economic entomology before he ventures to instruct others. We read with reference to the winter moth:—"In spring the grubs are hatched, and at once attack the young buds, calyces, &c. They become mature about November, or a little earlier, and let themselves down to the ground, and, burrowing to some little depth, become chrysalides (*sic*), turning into moths before spring arrives." As a matter of fact, the grubs (larvæ) become mature about May or early in June, and, having let themselves down, enter the earth, and remain there many months as chrysalids (pupæ), the perfect insects continuing to emerge all through the winter from November to February (or even March) in mild weather. The grease bands should be applied con-

tinuously during this period. What their use would be in April and May, so far as the perfect winter-moth is concerned, I know not; they might then detain a few full-fed larvæ, descending by the stem for pupation, but very few, because the majority descend by means of a silken thread. The genuine life-history of the winter-moth has been often detailed in the *Gardeners' Chronicle*. *R. McLachlan.*

RAINFALL IN NORTH WALES.—There is surely a misprint or mistake in the paragraph under this head on p. 594, which gives the rainfall for October at Mostyn Hall as 44 inches. The error could not mislead any one accustomed to rain statistics, but if not corrected, it might mislead those who are less experienced. The actual rainfall was "exceptionally large," but in the coastal district of North Wales was about one-fourth of the amount mentioned above. At Colwyn Bay a careful observer measured 10.32 (10 inches and 3.10ths), the largest amount for October ever known there. At Llandudno the fall was an inch or two less. At mountain stations like Llanberis and Capel Curig it might possibly have been twice as much, but even there a total of 44 inches for one month is an unrecorded amount. *C. B. D.* [We have received our correspondent's correction of the statement, which should have read "7.44 inches." *Ed.*]

SOCIETIES.

ROYAL HORTICULTURAL.

NOVEMBER 15.—During wet and dirty weather, on Tuesday last, the show at the Drill Hall, James Street, Westminster, was but poor. Amongst the most interesting exhibits were some hybrid Orchids, some new varieties of Chrysanthemums, and a large collection of Ferns.

Floral Committee.

Present: W. Marshall (chairman); and Messrs H. Herbat, B. Wynne, C. T. Drury, C. F. Bause, G. Phippen, C. J. Salter, H. Cannell, C. Jeffries, G. Paul, C. E. Pearson, J. Fraser, W. Furze, W. Bennett-Pöe, and H. H. D'Ombra.

For the prizes that had been offered for groups of Chrysanthemums, only one entry was made, and that in the class for a group from which Pompons and singles were excluded. Mr. Wythes, gr. to the Duke of Northumberland, Syon House, Brentford, staged a very creditable collection, and was awarded 1st prize. Messrs. Jas. Veitch & Son, Chelsea, had three dozen large blooms of Chrysanthemums, the best of which were *Etoile de Lyon*, *Vivand Morel*, *Jeane Delaux*, *Mr. E. W. Clarke*, *Avalanche*, *Florence Davis*, and *Mdlle. Marie Hoste*. Also *Begonia decora*, which at the last meeting was shown under the name of *B. barbata*, but which has since been determined a new species; it is a pretty dwarf-growing plant, with exceedingly ornamental foliage; the leaves are velvety-purple, with greenish-yellow veins, and very hirsute. It was awarded a First-class Certificate.

Messrs. J. R. Pearson & Sons obtained Awards of Merit for Chrysanthemums *Robert Flowerday*, a large wide-petalled incurved Japanese, rosy-crimson, with silvery-lilac reverse; and for Mrs. Needs, a good Japanese, large and full, white, with rosy-violet blush.

Wm. Seward, Esq., Hanwell, W. (gr., Mr. Shrimpton), an Award of Merit for *Princess Victoria*, a very deep and large Japanese, with yellowish centre.

Mr. C. E. Snea, The Elms, Foot's Cray, Kent, exhibited *Miss Dorothy Shea*, a large pale red Japanese reflexed, with buff reverse (Award of Merit).

A creamy sport from *Empress Eugénie* came from Mr. E. Molyneux, Swanmore Park Gardens.

Mr. Robert Owen, Maidenhead, exhibited a chestnut-red incurved sport from *Violet Tomlin*; Mr. J. Dibbins, Breakspear Road, Brockley, had Seedlings *Amy Chantler*, white Japanese, Duke of York, an incurved Japanese, rose, with silver reverse; and *E. Hillyer*, an incurved crimson, with pale yellow reverse.

Martin Smith, Esq., The Warren, Hayes Common, Beckenham (gr., Mr. Blick), obtained an Award of Merit for a very fine and bold Japanese of pale yellow; and Messrs. Cannell & Sons, Swanley, an Award of Merit for *Lord Brooke*, an incurved Japanese, of good promise; colour, a dark chestnut; and for *Aida*, an incurved Japanese, pale rose, with yellow or cream reverse. Messrs. Cannell & Sons had also a stand of good flowers of many of the newer and best kinds.

A very fine show of zonal Pelargoniums, which

served to illustrate the lecture, were exhibited by Messrs. Cannell, in bunches composed of several trusses, and staged over growing moss. The colours were exceeding bright and charming, the varieties new and the best out, viz., scarlet—Bright Eye, Sunray, Lord Iddeleigh, W. P. Wright, Rev. H. Harries, and Chas. Dickens; white—Swanley Single White and White Lady; pink—Amphion and Mrs. Wildsmith; salmon—A. F. Wootton, Mascagne, Beauty of Kent, and Inverness. Maud of Wales is a pink with a bluish cast; Madame Melba, a pretty blush, and Madame Boudeville, the most charming of all the blush section, having such delicate petals, with rosy margin (Silver Banksian Medal).

Mr. Wythes, Syon House gardens, was awarded a Silver Banksian Medal for a collection of Chrysanthemum blooms, cut with stems and foliage; the best were *Etoile de Lyon*, *Val d'Andorre*, *Mr. Bunu*, *Empress of India*, and *Madame Faber*.

A very large and fine collection of Ferns, occupying almost the whole of one side of the hall, was shown by Mr. H. B. May, Dyson's Lane Nursery, Edmonton, and consisting of 270 species and varieties. Adiantums were represented by about forty of the most distinct species and varieties. Amongst the Pteris were some new varieties which recently obtained Awards, viz., *P. v. nivalis*, *P. tremula variegata*, and *P. reginae cristata*. Amongst the Nephrolepis, *N. davallioides multiceps* is a very distinct and good form.

Gymnogrammas, both crested and plain, were represented, and in gold and silver varieties, also some of shades between the two, showing how difficult it is to divide the two sections. Platyceriums and Selaginellas were also represented (Silver-Gilt Flora Medal).

A basket of bunches of Violets Marie Louise were sent by Mr. J. Miller, gr. to Lord Foley, Ruxley Lodge, Esher, the perfume of which was an agreeable addition to the attraction of the exhibits.

Orchid Committee.

Present: H. J. Veitch, Esq., in the chair, and Messrs. J. O'Brien, S. Courtauld, T. B. Haywood, W. H. White, and E. Hill.

Sir Trevor Lawrence, Bart. (grower, Mr. W. H. White), exhibited a fine plant of a selected variety of *Cypripedium Morganiae Burfordiense* ×, which was pronounced to be the best *C. Morganiae* × yet shown (First-class Certificate). From the same gardens came a spike of *Calanthe sanguinaria* ×, with flowers of a deep crimson; and the handsome *Cypripedium pavonium* × (*Boxalli* × *venustum*) *Welbore* T. Ellis, Esq., Hazlebourne, Dorking, showed a beautifully spotted form of the rare *Catasetum tabulare*, in which the raised middle of the labellum was white spotted with reddish-brown (Award of Merit). Messrs. Jas. Veitch & Son, Royal Exotic Nursery, King's Road, Chelsea, staged some interesting hybrid Orchids, of which their *Cypripedium Tityus* × (*Spicerianum* ♀, *ananthum superbum* ♂) is very interesting as being a hybrid of several descents, *C. ananthum superbum* × being *Harrisianum superbum* ♀, *insigne Maulei* ♂, and *Harrisianum superbum* × the result of crossing *barbatum* and *villosum*. The flower of the plant exhibited possessed all the good qualities of *C. Leeanum*, but all the parts are broader and rounder (First-class Certificate). Another interesting hybrid shown by Messrs. Veitch was *Laelio-Cattleya aurora* × (*Laelia pumila Dayana* ♀, *C. Loddegesii* ♂). The plant somewhat resembled *Cattleya Acklandiae* in growth, having two leaves to most of the pseudobulbs. The flowers retained much the form of *Laelia pumila Dayana*, but were larger, and with a greater expansion of the labellum (Award of Merit). From the same nursery came *Cypripedium Perseus* × (*Sedeni porphyreum* ♀, *Lindleyanum* ♂), one of the first crosses with *C. Lindleyanum*, and a beautiful thing, with large rosy-crimson and white flowers (Award of Merit), and *C. Crethus* × (*Spicerianum* ♀, *Argus* ♂).

Messrs. F. Sander & Co. had a small group of fine Orchids, of which *Cattleya labiata albanensis*, a noble, richly-coloured form of their importation of the true autumn-flowering *C. labiata*, with nine flowers (Award of Merit); *Cypripedium Leeanum giganteum* × and *C. L. excellens* ×, each with six flowers; *C. × E. Ashworthi* (*plumerum* ♀, *Spicerianum* ♂), *C. × G. S. Ball* (*Spicerianum* ♀, *Lawrenceanum* ♂) were remarkable exhibits. Messrs. Sander also sent the greenish-white *Aerides Balfouri*, *Odontoglossum Rossii albens*, &c.

Messrs. Hugh Low & Co., The Nurseries, Clapton, E., had a group of Orchids, in which were several remarkably fine *Cypripedium bellatum*, *C. Arthur-*

ianum ×, *C. Chamberlainianum*, *C. insigne Mooreanum*, several of the rare *Saccolabium bigibbum*, *Vanda Amesiana*, *V. Kimballiana*, *Oncidium tigrinum*, &c.

Messrs. B. S. Williams & Son, Victoria and Paradise Nurseries, Upper Holloway, N., had a small group, in which their fine form of *C. Picheirianum* was prominent, which seems to improve each time it is shown, the centre being occupied by a very richly-coloured form of *Cymbidium giganteum*.

C. J. Lucas, Esq., Warnham Court, Horsham (gr., Mr. Duncan), sent two forms of *Angraecum bilobum*, the one with a lax and the other with a dense inflorescence, and a flower of one of the rose-tinted forms of *Cattleya aurea*.

From the gardens of Earl Cowper, Pansbanger, Hertford (gr., Mr. Fitt), came four well-flowered plants of the old form of *Cypripedium insigne*, which had some of the lower sepals divided, and in others the petals were tipped with white. A fine spike of *Cattleya Harrisii* (*guttata Leopoldii* × *C. Mendelii*), which was Certificated in 1888, was also exhibited by T. Statter, Esq., Stand Hall, Whitefield, who showed a spike of a grand variety of *Cattleya labiata vera*, with six flowers on a single spike—perhaps the best example of this useful and showy Orchid which cultivation has produced.

Messrs. John Laing & Son, Forest Hill, exhibited a finely-formed spotted variety of *Odontoglossum crispum*; and Reginald Young, Esq., Linnet Lane, Sefton Park, Liverpool, sent a spike of *C. labiata*, Young's variety, a beautiful form, with segments crimson-tipped, the upper sepal and upper halves of the lower sepals being petaloid and much broader than usual. The committee desired to see it again, to test its constancy. It came, it was stated, out of Messrs. Sander's importation.

Fruit Committee.

Present: Philip Crowley, Esq. (in the chair), Rev. W. Wilks, Dr. Hogg, H. Balderson, F. Q. Lane, J. T. Saltmarsh, G. Taber, A. Dean, G. Bunyard, G. Wythes, and J. Wright.

A collection of Melons, consisting of 2 dozen good-sized fruits, was exhibited by Mr. Wythes, gr. to the Duke of Northumberland, Syon House, and received a Bronze Banksian Medal.

Mr. J. Miller, gr. to Lord Foley, Ruxley Lodge, Esher, showed a seedling Melon of good flavour for the season, which the committee preferred to see again; fruit smooth and deep yellow. Also a large dish of Brown Turkey Figs, being the second crop from a house. The fruits were quite ripe and of good flavour (Vote of Thanks).

From Mr. Gilbert, Burghley Gardens, Stamford, came a number of Tomatos, Gilbert's Satisfaction, a nice smooth medium-sized fruit.

Mr. G. Brawn, Walsall, and Mr. C. Fidler, Reading, sent dishes of Potato, "Fidler's Colossal," for Certificate. The committee gave instructions to have the specimens cooked, for testing at the next meeting. The tubers are exceptionally heavy and large.

Mr. Philip Crowley brought some Plums (Rivers' Prolific) that he had dried in an ordinary oven, and after being soaked for some time, partially stewed. The fruit had been put into the oven when the fire had been allowed to wane, and the result was equal to the now well-known method of evaporating and drying fruits in quantity (Vote of Thanks).

ZONAL PELARGONIUMS FOR AUTUMN BLOOMING.

In the afternoon, a lecture on this subject was delivered by Mr. Chas. Pearson, of Chilwell Nurseries, near Nottingham. Mr. Pearson, in commencing, said, that it had appeared likely that this class of plants would entirely lose favour through the way in which they had been used during the bedding-out fever. They had happily been saved from this threatened disaster by skilful cultivation, which had proved them to be excellent flowers to grow in the duldest months of the year. Their chief recommendation for this season was, that the colours which had been declared too gay during summer, were better appreciated in dull and wintry weather, acting in some cases like a tonic upon those inspecting them. The objections generally urged against them applied much less in the autumn months, and could be greatly minimised, if the blooms were to be sent to a distance, by careful packing, and by using a little gum to secure the petals.

In selecting varieties, the lecturer advised that not too many of the vivid scarlets, such as *Vesuvius*, be retained, as some of them in bad weather often—unless under the best culture—fade into a bad colour. Charles Smith, Mr. Pearson said, was the best of this section to retain its colour. He would also suggest that but few doubles be selected, there

being but few of this group worth the trouble they entail. There was now such a wide range of colour, such a number of different varieties, which, although so varied, yet thoroughly harmonised one with the other, that it was a disgrace to any place where the culture of the Pelargonium was attempted, if only a few of the old common varieties were to be cuttings.

If fair-sized specimens were wished, the cuttings should be inserted in the previous August, but for smaller plants they need not be put in until spring. They should be put singly into thumbs, and when struck, potted into 3-inch, being transferred in June to their final shifts, which should be 5 or 6 inch. When the operation has been effected, the plants should be stood in the open upon some favourable situation, and the summer treatment would consist of pinching the strongest shoots, and of giving water as carefully and judiciously as possible. During the summer no stimulants should be given, as they would be sure to make sufficiently-atrong growth in a proper compost. It was very important that the plants be again housed before the heavy autumn rains, or many of the finer roots would decay, the soil become solidened, and failure would be the inevitable result. If the houses are not ready, some frame lights might be made to form a little accommodation until hard frost made their removal to the house imperative. When taken in they should be given ventilation freely until they have become accustomed to their closer quarters, and judicious watering would again be necessary for successful culture. This should be done in the morning, and care taken to prevent spilling any upon the stage or floor of the house. Pinching should be finished about six weeks before it is required they should bloom. The house most suitable for the Pelargoniums, Mr. Pearson said, was a low span-roofed erection. Its aspect should be north-east and south-west, which would secure the fullest benefit of what little morning sun was able to pierce our clouded atmosphere at this season, and the afternoon sun was not worth consideration. In fog-cursed districts it would be imperative that all glass should be thoroughly washed, and, also, in less unfavourable districts it would be wise to give attention in this direction. Mr. Pearson thought that there was little to choose between prepared beds or benches upon which to stand the plants, but about the temperature a much more decided opinion was entertained. It should not fall below 50°, and if 5° higher it would be so much the better. In the day the temperature should be 60°, rising 5° with sun. One of the most important points in the culture of these plants was that the temperature was right and kept uniform. If exhibition blooms were desired, the lecturer said that the shoot should be pinched immediately beyond the bud. In some of the double varieties this operation was a necessary part of ordinary culture. Mr. Pearson then went on to say that the compost he used was formed of rather light turf—that had been previously stacked, with linings of cow-manure—and a little sand. He believed that leaf-soil was very prejudicial to the culture of these plants, and he never used it.

The lecturer then concluded with a plea for more extended culture, for autumn-blooming, at the same time setting forth the advantages and attractions they offered; but Mr. Pearson was careful to say that he could not conscientiously advise the buying of Pelargoniums where there was not sufficient glass to give them a place to themselves, unless they were accorded just the treatment they required in the house they had to share. To buy a plant or two in autumn, and place them in a greenhouse amongst a miscellaneous lot of plants, would only result in disappointment; and it would only be courting failure also to put them into a kind of house that Mr. Pearson preferred to call an "architect's slaughter-house."

In the discussion which followed, some excellent remarks were made by Mr. H. Cannell, who exhibited some of the finest specimens of culture to illustrate the subject.

STROUD, GLOUCESTERSHIRE.

NOVEMBER 3, 4.—This was a thoroughly representative show, not only of Chrysanthemums but of other autumn flowers, as well as a large display of fruits, and a fine lot of vegetables. There was, as regards quantity, a falling off as compared with last year in Chrysanthemums, but the quality was good; the incurved blooms alone wanting more time to develop, showing that the backward season for this section is pretty general.

Groups and Specimens.—The groups made a fine display, the best being those from Mr. J. F. Wilkin-

son, gr. to Mrs. Frith, and Mr. R. Fawkes, gr. to Chas. Hooper, Esq., these two groups very nearly approached each other in merit, both containing well-grown plants, bearing fine flowers; both, however, lacked finish around the outer edge, pots and sticks being too conspicuous. Smaller groups were well-shown by Mr. T. Smith, gr. to G. J. Holloway, Esq., and by Mr. Birt. Trained plants were in some instances remarkably good, particularly the standards, the best three being those staged by Mr. G. Bastin, gr. to Mrs. Geo. Holloway, the varieties were Mrs. Dixon, George Glenn, and Elaine. Dwarf-grown plants from the same grower were by far the best, of medium size but well grown.

Cut Blooms.—In the large class for forty-eight distinct, twenty-four each of incurved and Japanese, Mr. A. J. Driver, gr. to Mrs. Davies, was 1st, being well ahead in each section. Amongst the Japanese were fine blooms of Thuoberg, Comte de Germiny, Roi des Japonais, and Vivand Morel, in excellent character, with first-rate flowers of John Doughty (extra fine), Lord Wolseley, Mrs. S. Coleman, Robert Cannell, and Enamel in the incurveds. Mr. R. Fawkes was a good 2d; Florence Percy and Eynsford White both being prominent flowers.

For thirty-six varieties, Mr. C. Mayo, gr. to A. Apperley, Esq., was 1st, having Sunflower (extra), Edwin Molyneux, and Thunberg, all in good form. Mr. J. E. Wilkinson also showing well, having a very fine flower of Stanstead White.

For twenty-four varieties, Mr. A. J. Driver again won with another excellent stand of flowers; Louis Bohmer amongst others being conspicuous. Mr. Butcher, gr. to W. Davies, Esq., also showing well.

With twenty-four blooms not less than eighteen varieties incurved, Mr. C. Mayo was again placed 1st, besides other good flowers previously named he had Miss Haggas, very bright. In the corresponding class for Japanese, Mr. A. J. Driver once more won, and that with very superior flowers. Golden Dragon, W. H. Woodcock, and Louis Bohmer, being all first-rate. Mr. E. Butcher was 2d with bright flowers, rather smaller than those in the first prize stand. Smaller classes were very well filled.

One class deserving particular notice was that for trebles of four vars. Japanese; in this, Mr. A. J. Driver won easily with grand-flowering Stanstead Surprise, Avalanche, Sunflower, and Edwin Molyneux, all of uniform size, the colours contrasting well. Mr. W. Driver was 2d in this class. In the corresponding one for incurveds, Mr. E. Butcher won with Jardin des Plantes, Prince Alfred, Jeanne d'Arc, and Mrs. Dixon; Mr. A. J. Driver following.

For six blooms of one var., Japanese, Mr. A. J. Driver won with Vivand Morel, large, and of fine colour, and again with six incurved, with Miss Violet Tomlin, staging very superior blooms.

For vases of Chrysanthemum blooms arranged for effect, Mr. A. King, gr. to E. Apperley, Esq., was 1st, the flowers of medium size, but the effect excellent; Mr. Bastin following closely, but the arrangement a trifle too compact.

Fruits.—The Grape classes were particularly strong, and the competition keen. For four vars., Mr. E. Butcher was 1st, showing Muscats, Alicante and Gros Maroc, with another white, bearing a close resemblance to Chasselas Musqué.

The Alicante class was a strong one, Mr. W. Driver, gr. to A. T. Playne, Esq., being 1st, with highly-coloured and large bunches. Muscats from the first-named exhibitor were placed 1st, likewise for any other white, with Trebbiano.

Apples and Pears were shown in capital condition, the entries being large, Mr. C. Mayo and Mr. A. King taking 1st for Pears; and Mr. J. Price for dessert, and Mr. E. Wyman for culinary Apples.

Miscellaneous classes for plants helped largely to furnish the room. These consisted of Bouvardias, finely-grown plants from Mr. A. J. Driver, from whom also came the best Cyclamen.

The zonal Pelargoniums in small pots were quite a feature, the best dwarf and profusely-flowered were from Mr. A. J. Driver.

The best group of stove and greenhouse plants, very tastefully arranged, Dendrobium Phalenopsis Schroderianum playing an important part, came from Mr. G. Cypher, gr. to Sir John Dorrington, Bart., and another good one from Mr. J. F. Wilkinson.

CRYSTAL PALACE.

NOVEMBER 4, 5.—Considering the extremely liberal schedule of prizes offered by the company on this occasion, the competition might have been more spirited than it was in some of the classes. The larger classes, wherein four prizes were offered in

each, were all keenly contested, save in two instances. This points to the fact that fourth prizes offer increased inducements to exhibitors to compete, and is worthy of further note in the framing of schedules for another season.

In the large class for twenty-four Japanese and twenty-four incurved, with not less than eighteen varieties of each, or more than two of any one variety, Messrs. W. and G. Drover, Fareham, won easily with grand flowers throughout; if anything, the incurved were possibly the finer lot. Amongst these note should be made of John Lambert, M. R. Bahuant, Alfred Salter, Lord Alcester, M. Darier, Mr. W. Shipman, and Prince of Teck, which were all remarkably fine well-finished flowers. Of the Japanese the finest were Mrs. E. W. Clark (extra colour), Puritan, Vivand Morel, Mrs. S. Dibbins (yellow, with narrow twisted florets), Miss A. Hartshorn, Sunflower, and Mrs. C. Wheeler. In this exhibit it was a difficult matter to find a second-rate flower; Mr. Salter, gr. to T. Haywood, Esq., Woodhatch Lodge, Reigate, was an excellent 2d, his best flowers being of incurved, M. R. Bahuant, Empress of India, and Golden Empress, and of Japanese, W. H. Lincoln, Gloire du Rocher (extra), and Edwin Molyneux. The next collections in this class were weak in incurveds, but in one instance particularly strong in Japanese.

For eighteen incurved varieties, Mr. Douglas, Great Gearies, Ilford, had the post of honour, beating Messrs. Drover, who came in 2d. Mr. Douglas' finest flowers were in his back row, and were very fine and even; these were Golden Empress, John Doughty, Emily Dale, Queen of England, Lord Alcester, Empress of India—Mrs. S. Coleman and M. R. Bahuant being also in good form. In Messrs. Drover's stand was an extra fine bloom of M. Darier, and another of Abbot's White.

Mr. Howe, gr. to H. Tate, Esq., Park Hill, Streatham, was 1st for twelve incurved varieties, the Queen and Empress family being the finest; Mr. Carpenter, gr. to Major Collis Browne, Byfleet, was a good 2d. Refulgens in this stand was of extra deep colour.

For six incurved, one variety, Mr. Carpenter again won, and that grandly, with half-a-dozen flowers of Refulgens, remarkable alike for their fine finish and colour. Mr. Shoemith, Shirley Cottage, Croydon, was 2d, showing Empress of India, very pure in colour.

For eighteen Japanese, the 1st prize went to Mr. Cox, gr. to J. Trotter, Esq., Brickenden Grange, Hertford. These blooms were all very even, and of excellent quality, seen all the better from the fact of being staged upon a larger size board. The finest were those of Etoile de Lyon, Mrs. F. A. Spaulding, Vice-President Audignier, Vivand Morel, Stanstead White, and Mrs. E. W. Clark. Mr. Douglas came in 2d, with flowers somewhat smaller, but of good quality.

In the class for twelve Japanese, Mr. Felgate, gr. to the Duchess of Wellington, Walton-on-Thames, was 1st, his blooms being of first-rate quality, Louis Bohmer (extra), Boule d'Or, and W. H. Lincoln being the finest.

With six of one kind (Japanese), Mr. Howe won with extra-fine blooms of Sunflower, remarkable both for colour and finish; Mr. Cox being 2d, with six of Avalanche, immense blooms, and fresh; the 3rd prize going to half-a-dozen Vivand Morel, of deep colour.

Mr. Salter was 1st for eighteen incurved, La Japonais, Cullingfordi, Edward Becket, and Elaine were the best of these. Mr. Felgate came in 2d, with a good stand, King of Crimsons and La Triomphante being particularly good.

Mr. Glen, gr. to Mrs. Montefiore, Worth Park, staged a fine lot of Anemone and Japanese-Anemone-flowered, in eighteen varieties, and was placed 1st, no one else competing. This stand would, however, have been hard to beat; the finest blooms were Miss A. Lowe, Souvenir de Madame Blaquiere, Dame Blanche, Mrs. Judge Benedict, Nelson, and Gladys Spaulding.

Mr. Knapp, gr. to F. W. Amsden, Esq., Chichester Road, Croydon, was first with Pompons, showing blooms of true Pompon character, not so remarkable for size as for perfect finish, Madame Elise Jordan, Black Douglas, and Toussaint Morizot being all noteworthy. Mr. Salter was 2d, with larger blooms, some few of which came dangerously near to the reflexed section, although classed as Pompons.

For Anemone-Pompons Mr. Salter was 1st, his best examples being Marguerite de Coi, Aglaia, and Sidonie; Mr. Knapp in this case was 2d.

Mr. Carpenter was 1st for singles, showing a very

attractive lot of blooms in trebles, Miss A. H. Bales, Rev. W. E. Remfrey, White Jane, Carrie Wells, and Lady Churchill, were the finest of these. Mr. Wells, Earlswood Nurseries, was 2d, with smaller flowers.

Groups.—In the large class of Japanese varieties only, Messrs. Reid and Bornemaon, Sydenham, were easily 1st, staging in a tasteful and practical manner some finely-grown plants, varying in height from the tallest down to others not more than 12 inches high as a finish to the front; Val d'Andorre, Avalanche, Edwin Molyneux, and Vivand Morel were all prominent, as also was Sunflower; these kinds carried in each instance grand blooms. Messrs. Carter & Co. were 2d, with clean and bright well-grown plants.

In the amateur's class, Mr. T. Wilks, gr. to C. Ralph, Esq., Upper Norwood, was a good 1st, the colours well chosen, and the culture excellent.

Specimen Plants.—These were hardly enough advanced; the best were a very fine half-dozen of Pompons, these were in profuse bloom, being admirable examples of cultivation, from Mr. Hughes, gr. to G. R. Higgins, Esq., Dulwich; Cedro Nulli, Aurora Borealis, and St. Michael, were the best.

Of Japanese varieties, the best half-dozen were those from Mr. Wesker, gr. to A. Heaver, Esq., Streatham Elms, Upper Tooting; these also were excellent, not over large, but well-flowered, Sarah Owen, Stanstead Surprise, Margot, and Madame Pigny being the finest.

Mr. Cherry, gr. to Mrs. Gabriel, Norfolk House, Streatham, was 1st, for incurved varieties, made up chiefly of the Rundle family.

Of new varieties, First-class Certificates were awarded to Messrs. Pitcher & Manda, Swanley, for Col. W. B. Smith, a splendid acquisition to the reflexed Japanese section, the flowers of extra size, in colour a rich bright golden-bronze; also for G. W. Childs, another fine Japanese of large size and perfect form, the colour a rich velvety-crimson, having no shade of brown or chestnut; and for Middle M. Hoete, a lovely flower, of a creamy-white shade, with broad reflexed petals.

Miscellaneous groups of plants were shown by Messrs. Shuttleworth & Co., Peckham Rye; and fruit by Messrs. J. Laing & Sons, J. Cheal & Sons, and J. Peed & Sons, all in good condition.

KINGSTON AND SURBITON.

NOVEMBER 8, 9.—A foggy morning succeeded by a fairly fine day greeted this excellent society's annual show, and greatly assisted it in enabling large numbers to attend. Held as usual in the Drill Hall, a spacious, though somewhat cold building, the show enjoys the distinction of presenting a very attractive and perfect whole, and thus is still the finest of its kind around London. The great contest of the show is that for the Challenge Vase, and the present one is the sixth. In 1890 Mr. Beckett took it for Mr. Bryant, of Juniper Hill. Last year Mr. Carpenter won it for Major Collis Browne, of Byfleet; and this year it has fallen to Mr. Mease, gr. to A. Tate, Esq., Downside, Leatherhead. Next year these three champions will have to fight out the class alone, and the winner then will take the vase for good. Mr. Mease had in his twenty-four incurved fine blooms of Queen of England, Violet Tomlin, M. R. Bahuant (very fine), Empress of India, Mrs. Heale, Jeanne d'Arc, Lord Alcester, Lady Doughty, Golden Empress, Nil Desperandum, Robert Cannell, &c., and of Japanese in the twenty-four, Vivand Morel, J. Stanborough Dibben, Middle Lacroix, E. Molyneux, G. C. Schwabe, Vice-President Darier, Puritan, Colonel W. B. Smith, Etoile d'Yon, E. W. Clarke, Sunflower, and Middle Marie Hoete; Mr. Carpenter was 2d, having also capital blooms, especially Alfred Lyne, Lord Wolseley, Nil Desperandum, John Salter, John Doughty, and Jardin des Plantes, of incurved, and Criterion, Avalanche, W. Tricker, Madame Baco, Wm. Coles, and J. Blenkinsop, of Japanese; Mr. Beckett, was 3d.

Mr. Mease was again a good 1st with twenty-four incurved blooms in that class, having Lady Doughty, M. R. Bahuant, Queen of England, Violet Tomlin, Mrs. S. Coleman, Lady Carey, &c. Mr. Higgs, gr. to J. B. Hanbury, Esq., Leatherhead, was 2d, his best flowers being John Lambert, Golden Empress, Refulgens, Miss Haggas, Empress Eugenie, &c. Mr. J. Thorne, gr. to A. E. Flood, Esq., Walton, was 3d.

With twelve incurved blooms, Mr. Juks, gr. to W. M. Grant, Esq., Cobham, was 1st, having good flowers of sorts previously named; Mr. J. Hopkin

gr. to Mrs. Witherspoon, Walton, was 2nd; and Mr. Felgate, gr. to the Duchess Dowager of Wellington, Walton, was 3rd.

Mr. Hawkes, gr. to J. B. Tate, Esq., Kingston, had the best six blooms; and in the class for six of one variety Mr. Carpenter was a good 1st, with beautiful flowers of *R. fulgens*—Mrs. Heale, and Queen of England following.

Japanese.—In the class for twenty-four blooms, Mr. Higgs was an easy 1st, with generally grand flowers. Sunflower—wonderfully fine, Madame Marie Hoste, W. H. Lincoln, Vice-President Darquier, Violet Rose—very fine, Lillian Bird, Vivian Morel, Altiéric Lunden, &c., were of the best. Mr. W. Mease was 2nd, with capital blooms, in which Col. W. B. Smith, J. Stanborough Dibden, E. W. Clarke, Casar Costa, and Gloire du Rocher were prominent. Mr. G. Trinder, gr. to Sir H. Mildmay, Bart., Dogmersfield Park, Wincfield, was 3rd.

Mr. Felgate had the best twelve Japanese; Mr. Milcham, gr. to A. T. Miller, Esq., Leatherhead, coming 2nd. Mr. Hopkins had the best six blooms, and of one variety Mr. Felgate was 1st, with a superb half-a-dozen of Sunflower, Vivian Morel coming 2nd, and fine Avalanche 3rd.

In the reflexed class, Mr. Carpenter was 1st, Mr. Mease 2nd.

Mr. Cawte, gardener to P. Robinson, Esq., Esher, had the best twelve Anemone blooms; and Mr. G. Woodgate, gr. to Lady Wolverton, Coombe Wood, the best twelve bunches of Pompons. Mr. Carpenter had the best lot of twelve bunches of singles, some of them very beautiful.

Of white Japanese, six blooms, Mr. Waite, The Gardens, Glenhurst, Esher, had the best in fine Middle Lacroix.

Mr. Woodgate also won a local cup with twelve Japanese and twelve incurved, good blooms; Mr. Cawte coming 2nd. But in a class for eighteen blooms of Japanese incurved, and Anemone, Mr. Cawte was 1st, and Mr. Woodgate 2nd; whilst in a class for twenty-four blooms of Japanese incurved and reflexed, Mr. Mease was 1st, and Mr. Woodgate 2nd. We can only refer to the fact that a First-class Certificate was awarded to Mr. Molyneux, Swanmore Park, for new incurved Mrs. Mitchell, a sport from Empress Eugénie, soft salmon-buff, received from New Zealand.

Turning to plants, the best mixed group came from Messrs. Puttock & Shepherd of Kingston, and included some good *Odootoglossums* and *Cypripediums*. Mr. G. Cock, gr. to J. S. Passmore, Esq., Walton, was 2nd with a very pretty arrangement; and Mr. J. Reeve, gr. to General Annesley, Oatlands Park, was 3rd.

Of Chrysanthemums, groups of which there were six all very fine, Mr. Milcham was 1st with a superb collection, finely bloomed and arranged; Mr. H. W. Pitcher, gr. to Mrs. Dunning, Surbiton, was 2nd; and Mr. Simmonds, gr. to W. Cunard, Esq., Twickenham, was 3rd.

Mr. J. W. Reed, Oatlands Park, had the best six trained plants, Sunflower, Dr. Sharpe, and Mrs. Forsyth exceptionally good. Mr. Reeves had the best three plants, also the best four Pompons.

Mr. Portbury, gr. to W. N. Tidy, Esq., Putney, had the best nine table plants, Mr. Milcham the best six double, and the best six single Primulas, in large competitions. Mr. Mease took the 1st prize for six Carnations in pots. Berried plants, Cyclamens, &c., made up other considerable classes. Table-stands and bouquets were good and numerous, so also were bunches of Violets. Mr. Trinder had some remarkably fine flowers.

Fruit made a telling feature. The best four dishes came from Mr. Griffin, gr. to A. Christy, Esq., Coombe Bank, who had good Muscat Grapes, Hériscart de Thury Strawberries, Apples, and Pears; Mr. Trinder was 2nd.

In the class for Black Grapes, Mr. Newman, gr. to J. A. Tulk, Esq., Chertsey, showed superb Gros Colman, large, and black as Sloes. These were not only placed 1st, but received the *Gardeners' Magazine* Medal; Mr. Elliott, gr. to P. W. Graham, Esq., Esher, was 2nd, with other wonderfully fine Gros Colman; and Mr. Ford, gr. to W. H. Ellis, Hounslow, was 3rd, with good Alicante. Mr. Griffin had also the best white Grapes, in Muscat of Alexandria. Mr. Ridge, gr. to E. J. Eady, Esq., Weybridge, had the best six dishes of Apples; and Mr. Trinder the best four dishes of Pears.

The 1st prize for a basket of vegetables was taken by Mr. Waite.

BIRMINGHAM CHRYSANTHEMUM EXHIBITION.

NOVEMBER 8, 9, 10.—The groups at the exhibition held on the above dates were very good, for the season is a late one in the Midlands, and the exhibition a week earlier than usual, but seven excellent groups were staged in the larger class; Mr. Dyer, gr. to Mrs. Marigold, being 1st; Mr. F. Jenkins, Olton, 2nd; with four other prize-winners. A class for smaller groups was also well filled, seven excellent groups being set up, Mr. Brasier, gr. to Sir T. Martineau being 1st.

Specimen Chrysanthemums have been well done at Birmingham for a good many years, and on this occasion the plants were not so large as we have seen them, but there was much less artificial training visible about them, a more natural habit prevailing. Mr. Waldron, gr. to G. Cadbury, Esq., Selly Oak, was 1st for nine plants, also for six plants, and three Pompons, and 2nd for three Japanese; and Mr. Dyer was 2nd for nine and six; and Sir Thomas Martineau 3rd.

The cut bloom section is invariably a strong point at Birmingham, and this year, for the first time, the usual class for twenty-four incurved and twenty-four Japanese was divided into two separate classes, with a 1st prize of £10 in each, with other liberal prizes following. In each class, Mr. Parker, gr. to J. Corbett, Esq., Impney, was 1st, with two excellent stands, and he was also 1st for eighteen Japanese, and secured the *Gardeners' Magazine* Silver Medal for excellence of culture; Mr. W. H. France Hayhurst, Wellington, was 2nd for twenty-four Japanese, and 3rd for twenty-four incurved; Mr. A. Coombs, gr. to the Earl of Dudley, Himley, was 3rd for twenty-four Japanese, and 2nd for twenty-four incurved. Nine lots of Japanese were staged, and in both classes. Other winners were—Mr. Goodacre, gr., Elvaston; Mr. Harman, gr. to the Earl of Denbigh; and Mr. J. Morris, gr. to Sir R. Moon, Bart., Coventry.

The classes for twelve Japanese, as also twelve incurved, were well filled.

Chinese Primulas are well done in this district, and there was a fine display again this year of even, well-grown specimens. In the open class there was a trial of strength amongst the local nurserymen for twelve.—1st, Messrs. Pope and Son; 2nd, Messrs. Thomson & Co.; whilst for six plants the positions were reversed. For six doubles, Mr. F. Denning, florist, was 1st, with medium-sized, well-done specimens, with very fine flowers, on Marchioness of Exeter especially; Messrs. Thomson & Co., 2nd; Messrs. Pope & Sons, 3rd.

The classes for gentlemen's gardeners, and in the special-prize classes, Mr. Clements, gr. to Mrs. Horton; Mr. Caldecott, a veteran grower and exhibitor; Mr. Cadbury's gardener, and others, were winners.

The Right Hon. Joseph Chamberlain, M.P., was the only exhibitor of Orchids, his six consisting of *Oncidium*, *crispum* and *tigrinum*; *Odootoglossum grande*, *Sobralia albo-nana*, *Cattleya labiata*, and a good pan of *Pleione lagenaria*.

From Highbury also was a group, not for competition, in which *Cattleya Dowiana*, *C. Massaiana*, *Cochlidia Noetzeliana*, *Oncidium Phalenopsis*, with *Masdevallias*, *Barkerias*, &c., were noticeable.

Fruit was not so extensive as usual, but it was of good quality generally.

For six bunches of Grapes, Mr. Goodacre was 1st with a fine lot; 2nd, J. F. Campbell, Esq., Uttoxeter.

For three bunches of Black Grapes.—1st, Mr. Bates, gr. to J. T. Harris, Esq., Stone, with Gros Colman, very fine in berry and evenness; 2nd, G. Cadbury, Esq., with fine bunches of Barbarossa.

For three bunches of white Grapes.—1st, Mr. Harman, gr. to the Earl of Denbigh, with well-coloured Muscats; 2nd, Mr. Slade.

There was a close competition also in the other classes of Grapes. Mr. Slade was 1st with an excellent Pine, and also staged, not for competition, four superb examples of Charlotte Rothschild and Smooth-leaved Cayenne, to which a Silver Medal was awarded.

Vegetables are much encouraged at the Birmingham November Chrysanthemum Exhibition, and Messrs. Sutton & Sons, R. Sydenham, Thomson & Co., Webb & Sons, offer liberal prizes for collections.

For Messrs. Sutton & Sons' prizes eight collections were staged, 1st, Mr. T. Smeetham, Seaton Knolls, Shrewsbury; 2nd, Captain Lloyd, Oswestry. For Mr. Sydenham's open prizes for ten varieties of vegetables, Mr. Smeetham was again 1st, with a very fine collection.

For Messrs. Webb's prizes, Mr. Smeetham was

again 1st; and Captain Lloyd, 2nd, both lots of excellent quality.

For Messrs. Thomson & Co.'s prizes, nine collections were staged, and here again Mr. Smeetham was 1st with a strong competition. The latter exhibitor received a Gold Medal for a collection.

Honorary exhibits were numerous. Messrs. Thomson & Co. staged a large collection of fine vegetables, a fine memorial arrangement of flowers, and a tastefully set-up group of plants. Messrs. Hewitt & Co., Solihull, a fine lot of Begonias; Messrs. Pope & Sons, a group of plants; Mr. Watkins, Hereford, a collection of Apples; Mr. Sands, a collection of Apples; Mr. W. Rose, Moseley Botanical Gardens, very fine Mushrooms grown in cellars; Mr. F. Denning, group of plants; there were sundry others.

A Certificate was awarded to Mr. W. J. Godfrey, Exmouth, for three blooms of Chrysanthemum Beauty of Exmouth; and Mr. R. Owen, Maidenhead, would have received some certificates, but the blooms of his new varieties came on the second day.

In Mr. Parker's 1st prize, twenty-four incurved, there was a grand bloom of Mrs. Robinson King, a great acquisition of Mr. R. Owen's, and John Lambert was very fine in this stand, as well as generally. Vivian Morel was also very fine everywhere, and there was a grand bloom of E. W. Clarke, Japanese, in the Rev. W. D. Thatcher's stand of twelve Japanese.

BOURNEMOUTH.

NOVEMBER 9, 10.—The Bournemouth and District Chrysanthemum and Horticultural Society held its sixth exhibition of plants and cut blooms of Chrysanthemums, fruits, flowers, and vegetables, in the Mont Dore Winter Gardens on the above dates, and was, on the whole, the best it has hitherto held.

Cut Blooms (open classes).—The principal class was for thirty-six blooms, to include eighteen Japanese and eighteen incurved, not more than two of any one variety. 1st, Mr. G. W. Taylor, gr. to J. P. Elphinstone, Esq., Christchurch; 2nd, Mr. N. Molyneux, gr. to J. C. Garnier, Esq., Rookbury Park, Hauts. Mr. Taylor was strong in Japanese varieties, large fresh blooms, in good variety. His best were Vivian Morel, Etoile de Lyon, Mrs. Wheeler, M. Baco, and Avalanche. Incurved: Golden Empress, John Lambert, Prince Alfred, Miss Haggas, Empress of India, and Lord Wolseley. Mr. Taylor was also 1st in four other leading classes, winning the medal given by Messrs. Watts & Son, Palace Nurseries, Bournemouth, staging good all-round blooms in every case; his Etoile de Lyon, which won the premier position in the single bloom class, was 7 inches in diameter, and 6 inches deep, the stem being inserted in a vase.

Mr. Garner, gr. to Mrs. Braddyl, Amberwood, Christchurch, had the best dozen of incurved varieties in the local classes, and took the Silver-gilt Medal of the National Chrysanthemum Society, in addition to a money prize, with good blooms.

Groups of Chrysanthemums, occupying a space varying from 30 square feet in the amateur class, to 60 square feet in the open class, made a fine show in themselves.

Silver cups, medals, and substantial money prizes, were given in all the group classes. Three groups were arranged in the open class. 1st, Messrs. Watts & Son, Bournemouth; 2nd, Mr. J. K. Ingram, The Nurseries, Parkstone; and 3rd, Mr. Blanchett of Pool. The plants in the 1st and 2nd prize groups were well grown and dwarf, Mr. Ingram's plants being from 20 inches to 30 inches high, and clothed with luxuriant foliage down to the pots, and having flowers of more than ordinary size. Messrs. Watts' flowers were uniformly large, Florence Davis, Etoile de Lyon, E. Molyneux, Avalanche, Vivian Morel, Louis Bohmer, and Madame Tricker, being among the best. Mr. C. Frampton carried away 1st honours for a very effective group in the class confined to single-handed gardeners.

Fruit.—This was shown in very good condition. Grapes (open).—Mr. Garner was 1st, out of five lots put up, for three bunches of black Grapes, with heavy well-coloured bunches of Black Alicante; Mr. S. Castle, Fordingbridge, being 2nd, with Gros Colmar in good condition. Mr. James Chalk, gr. to G. Read, Esq., Westwood, Salisbury, was 1st, for white Grapes, with three fine bunches of Muscat of Alexandria, consisting of large, clean, golden-amber-coloured berries; Mr. Garner was a good 2nd, with same variety. Mr. Taylor and Mr. Garner were the most successful exhibitors of Grapes in the local classes.

Apples and Pears made a fine display. Mr. Garner had the best three dishes of dessert varieties, showing clean, even, well-coloured fruits. Mr. J. Menzies, gr. to Lees Elliott, Esq., South Lychett, Poole, was 1st, for three dishes of Pears, staging grand specimens of Beurré Diel, Duchesse d'Angoulême, and Durondeau. Six grand fruits of Beurré Bachelier Pear, clean, and perfectly ripe, justly attracted a good deal of attention from visitors.

Vegetables.—These were shown extensively, and in fine condition.

Miscellaneous Exhibits.—Mr. Swaffield contributed a tastefully-arranged group of miscellaneous plants, including Palms, *Odontoglossum grande*, winter-flowering Heath, &c. Messrs. Stewart & Sons, Fern Down Nurseries, Wimborne; Messrs. Watts & Sons, Mr. Ingram, &c., contributing fruit, plants, and flowers.

GLoucestershire, ROOT, FRUIT, AND CHRYSANTHEMUM.

NOVEMBER 9, 10.—The above society held their annual exhibition on the above date, and the produce staged was generally very good. Reference was made recently in these columns to the trees and shrubs at Highnam Court. The Chrysanthemums are also worthy of special notice, as Mr. Sowray, the capable gardener at that place, proved by practically taking nearly all the chief prizes on this occasion; in fact, he was 1st in every class for plants and cut blooms with one exception—the Anemone class, C. Lee Campbell, Esq., Glewston Court, Ross (gr. Mr. S. T. Wright) taking 1st for a very fine stand of Anemone-flowered Chrysanthemums. The group of plants put up by Mr. Sowray was a model of what a group should be, plants, blooms and arrangement being excellent.

Fruit was well shown, Mr. Sowray, Mr. Wright, and Mr. Jones being the most successful in the Grape classes. With Pears, Mr. Wright was the winner of the 1st prizes in every class. Apples were splendidly staged by the English Fruit and Rose Co., Hereford; Mr. Wright, and a few others, most of the principal prizes going to those named.

Prizes are given to tenant-farmers within the county of Gloucester for the best and most profitable collection of Apples, and it is very gratifying to note yearly the improvement in culture made in fruit grown by them, and the greatly increased interest they now take in hardy fruit. There can be no question that the Society is doing very good work in the county.

Mr. J. Watkins, Pomona Farm Nurseries, Withington, Hereford, staged a very fine collection of Apples, of beautiful colour and good size, which received much attention from visitors.

Messrs. Sutton & Sons, Reading, sent a beautiful group of Cyclamens.

The show of Potatoes was not equal to former years, but after seeing the fine show at Earl's Court of the Potato, the beholder is, perhaps, a little hypercritical.

CARDIFF CHRYSANTHEMUM.

NOVEMBER 9, 10.—The annual show was held in the Park Hall on the above date. The exhibition was admitted by all to be the most successful—both financially and in quality of exhibits—that has yet been held in Cardiff. The feature of the show was the cut blooms, which, notwithstanding the late season, were exceptionally good. Groups were not so numerous as we have seen them in other years, but the display throughout the hall was very effective.

The fruit was of high merit—especially Grapes—and the competition keen.

Messrs. Clibran of Altrincham had a very attractive stand of Apples and Chrysanthemum blooms, the latter including fine specimens of the newest varieties.

Sir Ch. Phillips (gr., J. Dumble), took 1st prize for a collection of forty-eight cut blooms, thirty-six of which had to be distinct varieties. Some of the finest were W. H. Lincoln, Etoile de Lyon, Mrs. J. S. Fogg, Mrs. R. King, and a good specimen of Mrs. A. Hardy; T. J. Masters, Esq. (gr., Mr. J. Howe), obtained 2nd with a very good lot of blooms, among which were Ami Hoste, Sunflower, Vivian Morel, Lonia Bohmer, and Coronet; W. Stuckey, Esq., was placed 3rd, with a collection very little inferior to the 2nd.

For a stand of twenty-four distinct varieties of incurved and Japanese blooms, T. J. Masters, Esq., took 1st place, his best blooms being Ami Hoste,

Vivian Morel, Mrs. F. Jamieson, Violet Tomlin, and Princess of Wales. V. Stuckey, Esq., came next, with some fine blooms of Florence Davies, Lillian Bird, and Queen of England.

Captain Marling (gr., J. McDonald) took the lead among fourteen exhibitors for twelve Japanese blooms; among these were Vivian Morel, Florence Davies, and W. W. Coles. In the same class, Mr. S. Horton, of Cardiff, and V. Stuckey, Esq., took 2nd and 3rd places respectively.

Captain Marling again carried off the 1st prize for twelve incurved blooms, Ami Hoste, Lord Alcester, and Empress of India being well represented.

In the Anemone section, the competition and quality of bloom was so poor that the judges did not deem it advisable to award anything but a 2nd prize.

A Challenge Cup, valued at five guineas, was won by Sir C. Phillips, for a collection of twenty-four blooms, distinct varieties. This competition was only open to amateurs and gentlemen's gardeners.

The Earl of Lisburne was awarded the prize for the best bloom in the show, the variety shown being Vivian Morel.

In the open class for groups, Mr. G. W. Drake, Cathay's Nursery, Cardiff, carried off the 1st prize with a well arranged group of healthy dwarf plants.

Mr. W. Treseder, Cowbridge Road Nurseries, Cardiff, took 2nd prize; and Mr. F. Case, 3rd.

In the amateur class, Col. Page (gr., Mr. W. Hockey) was placed 1st with a group of dwarf plants, which, as far as could be seen, were furnished to the edge of the pots with dark healthy foliage. The 2nd prize in this class was obtained by J. P. Hacquoil, Esq., Rhymney Hill, Cardiff.

For a group of miscellaneous plants, Colonel Hill (gr., Mr. Clarke), was 1st, with a well-arranged collection of stove and greenhouse, foliage, and flowering plants.

Prizes were also given for wreaths, crosses, bouquets, and sprays. Messrs. Phelps & Co., Cardiff, took the 1st prize for wreaths; Mr. W. Treseder 1st, for the best cross; and Messrs. Phelps & Co. were successful in taking the prize for the best bouquet.

Mr. Davidson, of Ammanford, exhibited the best spray in the show, which was tastefully made up with Tea Roses, Asparagus, and grass spikes.

Fruit.—H. C. Moffat, Esq., of Goodrich Court, Ross (gr., Mr. Spencer), gained the 1st prize for five dishes of fruit. His collection consisted of Black Alicante and Golden Queen Grapes, Cox's Golden Gem Melon, Blenheim Orange, Apple, and Duchesse d'Angoulême Pear.

V. Stuckey, Esq., exhibited two bunches of very highly-coloured Black Alicante Grapes, for which he was awarded 1st prize.

Two bunches of Muscat of Alexandria, shown by Miss Rous, Court Ralla, Cardiff, had the premier place among the whites.

The vegetable exhibits were of such merit as to show that the past year in this district has been one highly favourable to their development. For the collection of six varieties, the competition was very close. Miss Rous took 1st place, General Lee 2nd, and Colonel Page 3rd.

SOUTH SHIELDS AND NORTHERN COUNTIES CHRYSANTHEMUM.

NOVEMBER 9, 10.—This show was held in the Assembly Hall, the upper and lower halls being quite filled. This society promises to become one of the best in the North of England, there being in the schedule this year no fewer than fifty classes, or nearly as many as the schedule of the National Chrysanthemum Society; and, with so energetic a secretary as Mr. Cowan, and a splendid executive committee, the result was a very fine exhibition.

For thirty-six cut blooms of Japanese varieties there were five stands set up, and that of Mr. P. Blair, gr., Trentham Hall, was adjudged the finest; amongst his varieties were very fine Vivian Morel, Sunflower, Avalanche, Eynsford White, and Mr. E. Beckett. Mr. Wheeler, Jesmond Towers, was 2nd.

For the thirty-six blooms of incurved varieties, competition was less—indeed, the date was too early for the district; Mr. Blair was 1st, and Mr. Walker, Low Fell, 2nd.

For twelve varieties of Japanese, Messrs. Smith and Wheeler took 1st and 2nd prizes in the order of their names.

For twelve bunches of Pompons the competition was very keen, Mr. Smith staging the finest lot.

In the Anemone classes Mr. Blair had a grand lot of blooms, easily securing the 1st prize besides

the C. S. Certificate. The same exhibitor was 1st for reflex varieties, the other exhibits being very backward, and many blooms not expanded. There were many entries in the classes for the bouquet-maker's art, and Mr. Blair was 1st with a bouquet consisting of chiefly Orchids; Mr. East, Southfield, being 2nd.

The groups entered for competition were many, and the society allows other plants besides Chrysanthemums to be included in them, as a finish in the front or as a background, the result being in some instances very good. Mr. T. Burton, Middlesboro, was 1st with a fine group, which was furnished at the back with large Palms, and so good were the Chrysanthemums as to obtain for it the National Chrysanthemum Society's Certificate for excellence; 2nd, Mr. Walker; 3rd, Mr. Wheeler.

Very fine large well-bloomed Chinese Primulas, staged by Mr. Walker, were 1st, with the other prizes being taken by local exhibitors.

Table plants were shown in large numbers, Messrs. Wheeler and Bathurst being the most successful with these.

A great number of Chrysanthemum plants were staged in the smaller classes, but the blooms were undeveloped. Amateurs in the neighbourhood contributed good plants, cut blooms, and Ferns in fine condition, but the class for zonal Pelargoniums was less well-filled.

Fruit.—Although the society does not offer any inducements in the shape of prizes for hardy fruit, as it cannot be well grown in the neighbourhood, liberal prizes are offered for Grapes. The best black Grape (Black Alicante) were shown by Mr. Hopper, Morpeth, who was awarded the *Gardeners' Magazine* Medal for excellence. For white Grapes, Mr. McDonald, South Shields, was 1st, with Muscat of Alexandria.

PUTNEY AND WANDSWORTH CHRYSANTHEMUM SHOW.

NOVEMBER 10.—The fifteenth annual exhibition took place on the above date in the Cromwell Hall. For a group, quality and general effect to be the leading features, the premier position was won by Mr. J. Dark, gr. to J. Hooker, Esq., Lomond House. Here there were some grandly-flowered plants of E. Molyneux; 2nd, Mr. S. Mynett, gr. to Colonel W. H. Poe, C.B., Ashburton House.

Twelve Chrysanthemums, distinct, amateurs.—1st, with free-flowered plants, J. Lass, Esq., Sandown Lodge; 2nd, S. W. Lambert, Esq., Northumberland Avenue.

Specimen plants were successfully shown by Mr. C. Bentley, gr. to W. J. Bosworth, Esq., Cedar Court, Roehampton; Mr. J. Portbury, gr. to W. N. Froy, Esq., Ripon House; Mr. J. Burtley, gr. to Lady Gabriel, Edgcombe Hall, Wimbledon Park; and others.

Twenty-four Japanese, cut blooms.—1st, C. W. Knowles, gr. to Mrs. Egerton, Solna; Vivian Morel, Sunflower, and Condor especially good in this stand. 2nd, Mr. J. Portbury.

Twenty-four incurved.—1st, Mr. C. W. Knowles; 2nd, Mr. J. Portbury.

Twelve incurved.—1st, Mr. C. W. Knowles; 2nd, Mr. J. Burtley.

Bouquets of Chrysanthemums were a pretty feature, being well shown by Mr. J. Portbury and Mr. G. Lacey, Upper Richmond Road.

Six Primulas, 1st, Mr. W. Reeve, gr. to G. Allen, Esq., Putney Hill; 2nd, Mr. H. Sims, gr. to W. Hancock, Esq., Putney Hill.

Six table plants, 1st, Mr. J. Portbury.

Group of mixed plants, flowering and foliage, 1st, Mr. J. Portbury, having some well-coloured Crotons; 2nd, Mr. A. Methven, gr. to W. Keller, Esq., Wimbledon Park.

Fruits and vegetables were successfully contributed by Mr. C. Grover, gr. to Col. W. E. Evans, The Elms, Roehampton, Mr. A. Methven, Mr. J. Burtley, Mr. C. W. Knowles, Mr. J. Portbury, and others.

A fine group of foliage and flowering plants, not for competition, contributed by Mr. J. F. McLeod, gr. to J. S. Morgan, Esq., Dover House, Roehampton, added much to the effectiveness of the exhibition. It contained, amongst other good things, some well-flowered plants of the now rarely-seen *Lasiandra macrantha*.

WINCHESTER CHRYSANTHEMUM.

NOVEMBER 10, 11.—The above successful exhibition was held in the Guildhall on the dates named, and cut blooms, as generally elsewhere, formed its

best feature. Mr. N. Molyneux, gr. to J. C. Garnier, Esq., Rooksbury Park, Wickham, Fareham, was 1st for forty-eight blooms, in eighteen varieties, his stand being an excellent one of leading varieties; 2nd, Mr. Neville, gr. to F. W. Flight, Esq., Twyford.

For twenty-four blooms, in twelve varieties of Japanese Chrysanthemums, Mr. H. R. Brown, gr. to A. B. Welch Thornton, Esq., Beaurepaire Park, Basingstoke, was 1st; and Mr. G. Trinder, gr. to Sir H. Midday, Dogmersfield Park, Winchfield, was 2nd.

Incurved (twelve), in as many varieties, were best shown by Mr. N. Molyneux, 2nd, Mr. Neville.

Mr. Molyneux was placed 1st for six blooms, Lord Alcester in the Queen class, and for six in any one class, excluding the former, with Mrs. Coleman; 2nd, Mr. Neville, in the last-named class.

For six blooms of any one white Japanese variety, Mr. Molyneux was 1st with Mlle. M. Hoste; 2nd, Mr. Holloway, gr. to F. N. C. Read, Esq., The Wskes, Alton, with Avalanche.

Etoile de Lyon was the variety staged by Mr. Molyneux in the class for six, any one variety, excluding white; Mr. Neville next in order of merit with Viviani Morel.

The Silver Medal of the National Chrysanthemum Society was awarded to Mr. N. Molyneux for excellence of culture noted in his stand of forty-eight blooms.

Groups of Chrysanthemums and specimen plants were of moderate merit. Mr. Street, gr. to Dr. Fearon, The College, Winchester, took 1st honours in the former; and Mr. Carr, gr. to W. A. Gillett, Esq., in the latter competition.

Fruit.—Some good Grapes were shown by Mr. Hall, gr., Lockerby Hall, Romsey; Mr. J. Gardener, Twyford Lodge; Mr. T. Hall, gr., South Stoneham House; and Mr. Trinder.

Mr. Hillier, nurseryman, Winchester, was highly commended for an excellent show of Apples in variety.

Vegetables were excellent, as shown by Mr. Bowerman, gr., Hackwood Park; and Mr. Best, gr., at The Vyne, Basingstoke.

Mr. E. Molyneux, gr. to W. H. Myers, Esq., Swanmore Park, had a meritorious exhibit of cut blooms of Chrysanthemums to aid in the display.

EXETER SHOW.

NOVEMBER 11.—The exhibition of this long-established Society was held, as is usually the case, in the Victoria Hall. This year's schedule contained a list of the presidents of the Society dating from 1829, in which year Lord Clifford was president. The Society, therefore, claims to be one of the oldest of those now existing. Hardy fruit made, as might be expected, a fine display, Apples especially being shown in large numbers, and of high colour. There were about 600 dishes displayed. Plants were of only moderate quality, and cut blooms formed the principal part of the floral display, and were generally very fine examples.

Japanese varieties seem to receive much encouragement from the Society, and a Silver Cup was offered for thirty-six distinct varieties, which was the means of bringing seven competitors into the lists. Mr. G. Hawkins, gr. to W. H. Fowler, Esq., Claremont, Taunton, won rather easily with a magnificent collection of leading varieties, well staged and very legibly named; especially good were the varieties Stanstead White, W. W. Coles, Viviani Morel, Mrs. A. Hardy, Mrs. E. D. Adams, Sunflower, and Lord Brooke. Mr. G. Foster, gr. to H. Hammond Spencer, Esq., Glendanaugh, Teignmouth, was a good 2nd.

For eighteen distinct Japanese varieties, a keen competition took place. Mr. Connelly, gr. to J. C. P. Talbot, Esq., Exeter, was an easy 1st, with magnificent blooms; 2nd, Mr. Fowler.

For twelve distinct Japanese, Mr. Searle, gr. to Miss Boyd, Gnaton, Torquay, was 1st, with a good stand of bloom; 2nd, Mr. J. Bishop, gr. to the Rev. F. C. Drake, Henlade, Taunton.

Mr. Connelly won the premier award for any white variety with blooms of Florence Davis, which were in prime condition.

The best yellow Japanese was Sunflower, shown by Mr. Connelly in the class for six of one variety. Mr. Fowler won in another class with Viviani Morel.

The incurved blooms were not equal to the Japanese in point of quality, still, they were staged in considerable numbers. Mr. Foster was 1st for twenty-four distinct varieties, and Mr. Stiles 2nd. For twelve distinct varieties, Mr. J. Bishop was 1st,

with what was, perhaps, the best stand in the show; and Mr. Connelly took 2nd place.

The quality of Anemone-flowered varieties was remarked to be very fine, and Mr. Prothero, gr. to W. McKenzie Bradley, Esq., Exmouth, was clearly 1st; and Mr. Veale, gr. to the Rev. H. Sims, Newton Abbott, 2nd. Single-flowered varieties and Pompons were best shown by Mr. Bond, gr. to F. Knapman, Esq., Exeter. The premier incurved bloom at the show was deemed to be a Golden Queen of England, shown by Mr. Connelly; and that for Japanese varieties, one of Stanstead White, found in Mr. Fowler's stand set up in the cup competition.

The best groups of Chrysanthemums, and also of miscellaneous plants arranged for effect, was contributed by Mr. W. Rowland, gr. to W. Brock, Esq., Exeter.

The numerous plants for table decoration, Poinsettias, Cyclamen, Bouvardias, and Violets, added considerably to the attractiveness of the show.

Fruit.—For twenty-four varieties of Apples, 1st, Mr. H. C. Williams; 2nd, Mr. Garland, gr. to the Hon. Sir J. D. Auckland, Exeter.

For twelve dishes, 1st, Mr. J. Gibbons, gr. to Rev. J. D. Gibbs, Exeter, with a very superior lot of fruit; and Mr. Martin, gr. to Lord Poltimore, Poltimore Park, Exeter, was 1st for six dishes and varieties of dessert Apples.

Excellent Grapes were shown by Mr. J. B. Payne, gr. to the Bishop of Bath and Wells, who was 1st with three bunches, and Mr. Martin 2nd.

Mr. Connelly was 1st for a like number of Muscat of Alexandria.

Mr. J. Wensby, gr. to J. H. Miller, Esq., Exeter, in the any other class competition, was 1st with Lady Downes, in grand condition.

Messrs. R. Veitch & Sons, nurserymen, Exeter; Jarman & Son, Chard and Godfrey, Exmouth, made noteworthy additions to the non-competitive exhibits, in the form of fruit and flowers.

MANCHESTER CHRYSANTHEMUM SHOW.

NOVEMBER 15.—The November show of flowers and fruit, under the auspices of the Royal Botanic Society, was held in the Town Hall. The Chrysanthemums, taken upon the whole, were a very goodly lot, and were keenly scanned by the promenaders throughout the day. There were over 1000 excellent cut flowers staged in the various classes, chief honours falling to Mr. E. Behrens, Whitechurch, who carried off the Gold Medal for thirty-six, closely followed by Mr. H. T. Robinson, Woolton, the Earl of Harrington, Mr. T. H. Sykes, Cheddle, and the Duke of Sutherland. Mr. Behrens was also successful in the incurved and in the Japanese classes. Other excellent contributions were staged by Mr. Heale, Fallowfield, Mr. T. Brocklebank, Woolton, Mr. Cross, Bolton, and Mr. E. Cockburo, Birkenhead.

The most prominent blooms over the whole of the stands were among incurved Lord Alcester, Alfred Salter, John Lambert, Queen of England, in both gold and white; Mrs. Robson, John Doughty, Mrs. Heale, Prince of Wales, John Salter, &c.

Among Japanese, Mrs. Laing, Wm. Lonsdale, Sunflower, Madame Mézard, Mrs. Wheeler, W. H. Lincoln (extra fine), Sarah Owen, Edouard Audiguier, Viviani Morel, Jeanne Delaux, stood out prominently.

Pot Chrysanthemums were in fully better condition than we have seen them; the best groups came from Mr. J. C. Charlton, J. A. Bhek, both of Didsbury, followed in some respects by Mr. Eaddam, Fallowfield, and Mr. T. Harker. Mr. J. Brown, Heaton Mersey, had the best group of Pompons.

Messrs. Clibran, Altrincham, had a very choice group of cut blooms of all the sorts, from single up to intensely formal incurved, and they looked well, set amongst Maidenhair Ferns, and backed up by choice noble Palms. Dickson, Brown & Tait made up a good group of Cyclamens, Cinerarias, Ferns, and Palms; and Dickson & Robinson had also a neat group, something after the same style. Mr. Chas. Moyes, Pendleton, put up a group of miscellaneous plants very effectively. Some few choice Orchids were tabled by Heath & Son, Cheltenham, comprising Cattleyas, Dendrobies, and Ladies' Slippers. Caldwell & Sons, Knutsford, had a miscellaneous group, and Mr. S. Allen, Sale, put down a very effective combination as a screen at the entrance hall. Mr. Browne sent some sweet-smelling cuttings from Llandudno, nothing finer than the yellow Wallflower, the varied Primroses, lots of Michaelmas Daisies, and some late-blooming annuals.

The fruit was well-coloured, but rather deficient in size. Mr. Barker staged thirty-six dishes of Pears and eighty-four of Apples, which were much admired. In the competition classes Lord Harrington took the leading position, followed by Mr. Barker and by Mr. C. Lee Campbell of Ross.

One word in favour of Mr. Mason's style of making up bouquets. They were not only loosely put up, so as to individualise the Roses, the Orchids, the Carnations, and such like of which they were composed, but they "cut at" the dumpy plum-pudding form which was wont to rule, and the educated eye was all the more gratified.

THE WEATHER.

[By the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

- 7, England, N.W.;
- 8, England, S.W.;
- 9, Ireland, N.;
- 10, Ireland, S.;
- (* Channel Islands.)

THE PAST WEEK.

THE following summary record of the weather for the week ending November 12, is furnished from the Meteorological Office:—

"The *Weather* during this period was extremely gloomy, damp, and foggy over the greater part of England (especially in London and its neighbourhood), and cloudy or dull over Ireland and Scotland. In the latter regions rain fell frequently, and in Ireland the falls were occasionally heavy.

"The *temperature* just equalled the mean in 'England, E.' but in all other districts it was slightly in excess; in 'Scotland, N.' however, the excess was as much as 5°. The highest of the maxima were registered on somewhat irregular dates, and ranged from 62° in 'Scotland, W.' and 58° in 'Ireland, S.' and the 'Channel Islands,' to 52° in 'England, N.E.' The lowest of the minima were recorded between the 7th and 9th, and ranged from 25° in the 'Midland Counties,' and 26° in 'Scotland, E.' to 34° in 'Scotland, N.' and to 38° in the 'Channel Islands.'

"The *rainfall* was more than the mean in Ireland, and just equal to it in 'Scotland, W.' but in all other parts of the kingdom there was a deficit; over the central, southern, and eastern parts of England the fall was very slight.

"The *bright sunshine* was very deficient generally, especially over northern and eastern England. The percentage of the possible amount of duration ranged from 9 in 'England, E. and N.E.' and 10 in 'Scotland, N.' to 26 in the 'Midland Counties,' and to 33 in 'England, S.W.' The lowest percentages of all were 2 at Stonyhurst, and 3 at Geldeston."

SEEDS.

LONDON: Nov. 16.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., state that as regards American Red Clover seed, which still constitutes the most interesting feature of the trade, last Monday's sudden advance on the other side of £4 per ton has enabled early English and French purchasers to sell under current trans-Atlantic rates. There is no change this week in either Alsike, White or Trefoil. In Rye-grasses the tendency is still upwards. For Winter Vetches there is just now very little inquiry. Koenigsberg Tares, being cheap and good, attract increased attention. Blue Peas are steady. Some choice new Dutch Haricot Beans are now obtainable at very tempting figures. Canary seed is featureless. Hemp seed keeps strong at the late advance. Very full prices are realised for Mustard. Rape seed continues cheap.

FRUITS AND VEGETABLES.

SPITALFIELDS: Nov. 15.—Quotations:—Cauliflowers, 2s. to 5s.; Savoy, 2s. to 3s. 6d.; Collards, 2s. to 2s. 6d. per tally; Seakale, 6d. to 1s. per punnet; Curly Kale, 1s. to 1s. 6d.; Spinach, 1s. to 1s. 6d. per bushel; Brussels Sprouts, 1s. 3d. to 1s. 9d. per half-sieve; Beetroots, 1s. to 2s. per sieve; Turnips, 2s. to 2s. 6d.; Carrots, 1s. 9d. to 2s. 6d.; Greens, 1s. to 1s. 6d.; Parsley, 1s. 6d. to 2s. per dozen bunches; Eddive, 6d. to 1s.; Cabbage Lettuce, 4d. to 6d.; Leeks, 2s. to 2s. 6d. per dozen; Cos Lettuce, 6d. to 1s. per score; Celery, 6d. to 1s.; Horseradish, 1s. to 1s. 2d. per bundle; Mustard and Cress, 1s. 6d. to 1s. 9d. per dozen baskets; Onions, English, 5s. 6d. to 6s. per cwt.; do., Spanish, 5s. to 6s. 6d. per case; do., Dutch, 4s. 6d. to 5s.; do., Belgian, 4s. 6d. to 5s. per bag of 110 lb.; Carrots, 30s. to 50s. per ton; English Apples, 2s. to 6s. per bushel; American, do., 12s. 6d. to 18s. per barrel; English Tomatos, 4s. to 5s. per peck.

BOROUGH: Nov. 15.—Quotations:—Cabbages, 3s. 6d. per tally; Cauliflowers, 9d. to 1s. 3d. per dozen; Brussels Sprouts, 1s. to 1s. 3d. per half-sieve; Carrots, 2s. 6d.; Turnips, 1s. 6d.; Parsley, 1s. 6d. per dozen bunches; English Onions, 6s. to 6s. 6d.; Dutch do., 5s. per cwt.; Horseradish, 2s. to 2s. 3d.; foreign do., 1s. 6d. per bundle; English Apples, 2s. 6d. to 10s. per bushel.

STRATFORD, Nov. 16.—There has been an excellent supply of all kinds of produce at this market during the past week, and a brisk trade was done as under:—Cabbages, 2s. to 4s. per tally; Savoy, 2s. 6d. to 4s. 6d. do.; Greens, 9d. to 1s. 3d. per sieve; do., 1s. to 1s. 6d. per dozen; Cauliflowers, 6d. to 1s. do.; do., 2s. 6d. to 4s. per tally; Turnips, 1s. 6d. to 2s. per dozen bunches; do., 2s. to 40s. per ton; Carrots, household, 42s. 6d. to 50s. do.; do., cattle-feeding, 32s. to 38s. do.; Parsnips, 9d. to 1s. per score; Mangolds, 16s. to 20s. per ton; Swedes, 20s. to 22s. do.; Onions, English, 100s. to 130s. per ton; do., Dutch, 4s. to 4s. 6d. per bag; do., Bordeaux, 6s. to 6s. 6d. per case; Apples, English, 2s. to 5s. per bushel; do., American, 12s. to 20s. per barrel; Brussels Sprouts, 1s. to 1s. 6d. per half-sieve; do., 2s. to 2s. 6d. per bushel; Celery, 9d. to 1s. 2d. per roll; Horseradish, 1s. to 1s. 6d. per bundle.

FARRINGTON: Nov. 17.—Quotations:—Turnips, 45s. to 50s. per ton; Sprouts, 1s. to 1s. 3d. per half-sieve; English Onions, 7s. per cwt.; Spanish do., 5s. 6d. to 6s.; Beetroot, 4s.; Carrots, 3s. to 3s. 3d. per cwt.; Apples, Canadian, 12s. to 16s.; English King Pippins, 4s. 6d. per bushel; Tomatos, 2d. to 4d. per lb.; Grapes, 12s. to 16s. per barrel.

CORN.

Averages.—Official statement of the average prices of British corn, imperial measure (quarter) for the week ending November 12, and for the corresponding period last year:—1892: Wheat, 28s. 3d.; Barley, 27s. 3d.; Oats, 18s. 1891: Wheat, 37s. 2d.; Barley, 30s. 11d.; Oats, 21s. 4d.

NOTICES TO CORRESPONDENTS.

. PHOTOGRAPHS, DRAWINGS, OR SPECIMENS.—We shall be pleased to receive from our Correspondents notes relating to interesting Gardens, together with Specimens or Illustrations of interesting Plants. Although circumstances prevent us in all cases from reproducing them, we are nevertheless glad to receive them, and as far as possible to utilise them for the benefit of readers.

ASPARAGUS: C. W. W. Having bought the roots, they will be best planted without delay, unless you are possessed of a lot of cold frames, when you might place them close together in light soil, and plant them in March. Of course, there must be no coddling of the roots, only keep them moist, and protected from frost by means of the lights. In the case of roots planted so late as November, all the injured roots rot more and more, and cripple the plants for a year.

BOOKS: J. H. *The Nursery Book*, by L. H. Bailly (New York Publishing Co.)—CHEMICAL MANURES: J. H. M. G. Ville's *Artificial Manures*, translated and edited by Wm. Crookes, F.R.S. (London: Longmans, Green & Co.)

CARNATION FUNGUS: H. G. This was first described and figured in our columns in 1870, p. 382, and since that time has been repeatedly figured. In

country, then it is a departure. But even then it only serves to show that C. Dowiana and C. aurea are one and the same thing.

CEDARS: A. You will find that Solomon was not only a consumer of timber, but a planter also; see II. Chronicles, i., 15:—"And Cedar trees made he as the Sycomore trees that are in the vale for abundance." Such a proceeding was necessary, considering the wholesale felling that went on by his orders.

CHRYSANTHEMUM ETOILE DE LYON: J. H. A Japanese variety, raised by M. Boucharlat, in 1888. We have no information as regards the size to which a bloom of it has been grown.

CORRECTIONS: p. 594, for *Grimm* read *Grimm*; p. 581, for *turf-road* read *turf-land*.—N. C. S. Show, Mr. A. Ives, gr. to E. C. Jukes, Esq., should have been credited with showing *La Deuil*, a rosy red Japanese, and not Mr. Blick. The new incurved variety, *Lucy Kendall*, shown by Mr. Owen, of Maidenhead, and raised by Mr. J. P. Kendall, gr., Templeton, Roehampton, is a sport from *Violet Tomlin*, of a chestnut-red colour, and not a purple-red Japanese, as was stated in our report.

GRAPES FALLING FROM THE BUNCHES: J. W. If your Grapes are not very badly shanked, we should suppose that you may have watered the border heavily, or left it exposed to the late heavy rains. If the stalks of the berries are thin, brown, and shrivelled, and the juice sour, it is shanking, and you must examine the border for bad drainage, soured soil, or roots at a great depth.

GRUB: J. H. That of the smaller species of cockchafer. Turn over the ground with a digging-fork several times, the birds will then find them.

HORTICULTURAL EDUCATION: A. H. C. The Horticultural College, Swanley, Kent.

IRON STAKES: C. W. *Sons*. The action of rusty iron has no effect on plants in contact with it, other than what might be caused by rubbing against it. That wounds caused in the rind of stem or shoot will, in bad cases, cause the loss of the shoot; but if the cause is timely removed, no evils will result. Iron, except in the form of soluble salts, has no value as a plant-food.

NAMES OF FRUITS: T. C. 1, Aromatic Russet; 2, Horned Pearmain. Spray did not arrive.—*Walter Parker*. 1 and 5, Beurré Rance; 6, Beurré Diel; 7, Comte de Lamy; 8, Easter Beurré; 11, Vicar of Winkfield; 12, Knight's Monarch; 15, Winter Nelis; 13, Lane's Prince Albert; the others are too small to be identified.—*Amicus*. 1, Beurré Diel; 2, Beurré Bachelier; 3, Duchesse d'Angoulême; 4, Josephine de Malines; 5, Winter Nelis; 6, Jules d'Airoles; 7, King of the Pippins; 11 and 12, Scarlet Nonpareil.—*J. B. D. H.* 1, Duke of Beaufort; 2, Royal Somerset; 3, not identified; 4, Warner's King; 7, Brabant Bellefeu; 5, not sure of.—*Wm. Withes*. Appl: Blenheim Orange.—*Wm. Huggie*. Apple: Col. Vaughan.—*H. J. Sons*. The Damsons are too small for recognition. Send shoots and leaves with fruit another year.

NAMES OF PLANTS: D. Davis. *Physalis Alkekengi*, Winter Cherry.—*Worksop*. The scarlet-fruited Thorn, *Crataegus coccinea*.—*E. D. L.* 1, *Doodia caudata*; 2, *Dicksonia punctilobula*; 3, *Sericographis Ghiesbreghtiana*; 4, 5, and 6, next week.—*H. J. R., Florence*. *Pleione Wallichiana*.—*C. H.* 1, *Adiantum tenerum*; 2, *Cyrtotium Caryotidum*; 3, *Blechnum occidentale*; 4, *Gymnogramma ochracea*; 5, *Davallia bullata*; 6, *Davallia Tyermanii*. The damp moss had almost obliterated the numbers.—*B. Williams*. We do not undertake to name florists' flowers.

PARSNIP EATEN BY INSECTS: T. B. Wireworms, or grubs of the cockchafer, or weevil. The insect sent had escaped. Dress the land with gas-lime some months before putting a crop on it, or dig it over frequently, so as to bring the grubs within reach of the birds.

PEA HAULM 15 FEET HIGH: G. B. A very unusual height for a culinary Pea to grow.

PRUNING: W. W. Raspberry Canes.—The best of these should be left, to the number of four to seven, on a stool, cutting the remainder away at the ground level. If the stools are 5 feet apart, the canes may have their tips cut off, and be slightly twisted together, and brought over the half of the canes from each stool, and tied to a stout stake driven into the soil midway between the stools. The fruit will then have full sun-

FIG. 94.—CARNATION LEAF DISEASE.

the *Carnation Manual*, Mr. C. Blick is stated to have got rid of the plague by frequent sponging the plants with weak solution of Gisburst Compound.

CARROTS: C. E. H. If these roots contain a poisonous property, which we doubt, it must be an infinitesimal quantity.

CATTELEYA: W. Cobb. We should suppose this *Cattleya* to be the *Costa Rica C. Dowiana*, and if that is so it is nothing extraordinary. If it came with *C. Dowiana aurea* from the *C. Warszewiczii*

shine, and is readily gathered. There are some modifications of this method. Sometimes Raspberries are planted 1 foot apart, and fastened to two or three lines of iron wire. Market growers use no stakes, but top the plants at about 4 feet from the ground, and as field-grown canes are usually shorter and stouter than those grown in gardens, this method answers well enough. Apples on espaliers—need at this season to have the summer shoots, that were shortened somewhat in July, cut back to within half to 1 inch of their base, but all or most fruit buds should be reserved. The nuptial tips of the leading branches should be cut off, unless rapid extension is desired. Some varieties of Apples have long fruit spurs terminating, say, from 3 to 5 inches. These should not be cut back; it is easy to recognise them by the plumpness of the terminal buds. Summer pruning consists in the shortening back of the current season's growth to half its length, entirely cutting out that which is weak. If fruit spurs are closer together on the rods than 6 inches, cut off where most crowded down to the old wood, making quite smooth wounds, and if the spurs are very long, as they will often be from age, cut every one off smoothly, and the branches will bristle with shoots the next year, when you must choose those to be retained, cutting the other clean away. Apricots.—The tree should have the greatest part of its pruning done in the summer, with the finger and thumb, never using the knife if you can help it. It bears on spurs like sweet Cherries or Apples, and on 1-year old wood. This 1-year-old wood may be shortened at the winter pruning if it be too long, or there is a want of wood somewhere about the base of these shoots. Much diligence is required in the summer in keeping Apricots in order by stopping shoots that are not wanted, and laying in those that are.

ROSES: *W. G.* Rosa canina is a British species, raised from seed, cuttings, or suckers. Rosa Manetti is a seedling from some garden variety raised by Signor Manetti, of the Botanic Garden, Monsa, and introduced to this country by the late T. Rivers, of Sawbridgeworth, about forty-five years ago.

ROSES FOR PLANTING UNDER GLASS: *G. S. Yellow:* Maréchal Niel and *W. A. Richardson;* *White:* Lamarque; *Red:* August Rogotard; *Pink:* Cheshaut Hybrid and Catherine Mermet.

SPELLING: *W. M. & Co.* The best authorities spell the words Gros Colman, others Gros Colmar, and Gros Golman. All of these are probably French corruptions of the German Gros Kolner or Grosser Koelner.

TOMATOS: *A.* You will find an attempt at a classification of the Tomatos on p. 273 of our Number for August 29, 1885, with illustrations. We have not pursued it further, but it might be useful to use as a basis.

TOMATO IMPORTATION: *R. G. W.* There are no data as to the quantities imported, and for prices we must refer you to our market reports.

TREES FOR EXPOSED PARTS OF THE COTSWOLDS: *N. Bell.* Austrian Pine, Abies Pinsapo, Pinus Pinaster, P. resinosa, common Beech, Hornbeam, Pseudotsuga Douglasi, where sheltered by the outer lines of trees; Yews of all kinds; Cupressus macrocarpa and its varieties; C. Nutkaensis, C. sempervirens, where sheltered by other trees; Crab, Sloea, Bullace, common Oak and Futzie if sown; Elder, and Beech grown as copse wood, and cut down to a stool when it reaches 15 to 20 feet, should form with Austrian Pine the outer lines of plantations. Dig the ground, breaking up the subsoil with a pickaxe, but not burying the fertile top soil. Plant thickly and thin out early.

THOMAS GREEN & SON, LTD., LEEDS and LONDON,

HORTICULTURAL ENGINEERS to HER MAJESTY THE QUEEN, call Special Attention to their Patent Wrought-Iron Municipal or Angular Chambered and Tubular

HOT-WATER BOILERS,

And others with SHELVES, and HOLLOW or ORDINARY CAST-IRON GRATE BARS.

SADDLE BOILERS, With WATERWAY BACKS and WELDED BOILERS, any of which are specially adapted for Heating Greenhouses, Conservatories, Churches, Chapels, Schools, Public Buildings, Entrance Halls, Warehouses, Workshops, &c. They are the neatest, cheapest, most effective, and durable of any extant.

The MUNICIPAL and TUBULAR ones are remarkable for their great heating power, slow combustion, and the length of time the fire will burn without requiring attention.

These Patterns secured the FIRST and HIGHEST PRIZE—a SILVER MEDAL—at the Royal Horticultural Society's Exhibition, South Kensington, London, June 1, 1881.

MUNICIPAL PATTERN BOILER, THE BEST EXTANT.

TESTIMONIALS.

Re HEATING APPARATUS. Borough Engineer's Office, Municipal Buildings, Leeds. January 9, 1886.

MESSRS. THOS. GREEN AND SON, LTD., NORTH STREET, LEEDS.
GENTLEMEN.—I have great pleasure in bearing testimony to the efficiency and satisfactory working of the Hot-water Heating Apparatus you erected in these public buildings.

The buildings are four storeys high, and we have a total length of about 28,000 feet of piping in them, varying in size from 1½ in. to 6 in. diameter, with their connections, &c. The several offices and rooms can all be in operation at one time or separately, and the heat regulated by means of the valves to the temperature required, even in the coldest weather.

Two of your Patent Municipal Pattern Boilers, No. 4, work the whole of this piping easily, although we have three of them fixed. They are very powerful and economical in the consumption of fuel, and I am pleased to be able to report of them and the apparatus so favourably.

I am, Gentlemen, yours truly, THOS. HEWSON, Borough Engineer.

Morley House, Bagot, St. Saviour's, Jersey, November 10th, 1886.

GENTLEMEN.—The large Municipal Boiler which you sent me last year is doing its work satisfactorily; it is heating 5000 feet of 4-inch pipe in one of my vineries, and I am quite sure that it has power to work a much greater length, while its cost of fuel it compares favourably with my other Boilers.

I have now five of your Boilers in use, and I cannot speak too well of their heating powers, or their comparatively small consumption of fuel.

MESSRS. THOS. GREEN AND SON, LTD., LEEDS.

Yours faithfully, (Signed) G. W. BASHFORD.

And HUNDREDS OF OTHER REFERENCES CAN BE GIVEN IF REQUIRED.

100 GARDEN LIGHTS (New).—6 feet by 4 feet, very strong; Framework, 3 in. x 2 in. thick, with Iron Bar across, 2s. 11d. each; and if supplied with 21-oz. Glass, 8s. each.
Also **GREENHOUSE (New)**, 50 feet x 10 feet wide, including 21-oz. Glass, stoving and painted, £21.

DR. SMILES'S WORKS.

JASMIN: BARBER, POET, PHILANTHROPIST. Post 8vo. 6s. Fourth Thousand.

"What Jasmin did for himself in poetry Dr. Smiles has now done for him in prose, doing full justice to that part of his life which Jasmin's simple modesty forbade him to record, namely, his unceasing philanthropic efforts. The story is noble as well as touching, and is told by Dr. Smiles with abundance of sympathy and appreciation."—The Times.

"Dr. Smiles has performed a praiseworthy task in introducing this little-known but admirable man to English readers. . . . He died worn out at the age of sixty-five. In the south of France he was mourned as the friend of the friendless, as the St. Vincent de Paul of poetry."—Academy.

"Dr. Samuel Smiles has given to the world a graceful and sympathetic record of a pure and beautiful human life, teeming with the poetry of action as well as of thought, and redolent throughout of good deeds and loving kindness."—Daily Telegraph.

"Il a fait un livre bien personnel et aussi complet que possible. Voilà Jasmin 'raconté' en anglais pour la postérité. C'est M. Smiles qui est le coupable, et son élégant volume nous a tout à fait charmé."—Revue Littéraire.

"No one of Dr. Smiles's books is more delightful than this one about the warm-hearted poet of Gascony. Dr. Smiles appears here at his best; for the story of Jasmin's life is full of romance, and the style of this volume has the happy characteristics of ease, simplicity, and beauty."—Liverpool Mercury.

"The story of such a life is well worth telling, and it has been admirably and sympathetically told by Dr. Smiles in a book which, to our mind, is one of the most attractive of all his works."—John Bull.

"One of the most touching and charming biographies we have ever read."—Critic (New York).

TO FLORISTS.—A young Man desires a situation in a Florist's Shop; understands Window Boxing, Furnishing, &c.; five years' experience.—FLORIST, 31, University Street, W.C.

HOLLOWAY'S OINTMENT and PILLS.—As winter advances, and the weather becomes more inclement and trying, the earliest evidences of ill-health must be immediately checked and removed, or a slight illness may result in a serious malady. Relaxed and sore throat, quinsy, influenza, chronic cough, bronchitis, and most other pulmonary affections will be relieved by rubbing this cooling Ointment into the skin as nearly as practicable to the seat of mischief. This treatment, simple yet effective, is admirably adapted for the removal of these diseases during infancy and youth. Old asthmatic invalids will derive marvellous relief from the use of Holloway's remedies, which have wonderfully relieved many such sufferers, and re-established health after every other means had signally failed.

AWARDED TWENTY PRIZE MEDALS

AT INTERNATIONAL EXHIBITIONS AT HOME AND ABROAD.

KEITH'S PATENT BOILERS, THE "CHALLENGE," "VIADUCT," "PYTHON," &c.,

FOR HOT-WATER HEATING, "STAND FIRST," require no building work round them, are entirely water-jacketed, and heat from 50 feet up to 20,000 feet of 4-inch pipe respectively. Many thousands are in use all over the world, and the Boilers are unrivalled in power and economy.

KEITH'S "PYTHON" BOILER, as illustrated below, has 1000 square feet of effective heating surface, with 17½ square feet of fire-grate area; heats about 20,000 feet of 4-inch pipe, and is the Most Powerful and Complete Sectional "Special" Hot-water Heating Boiler in the World.

This Engraving "illustrates the most powerful form of Boiler that has yet been made for Hot-water Circulation."—Extract from Hood, on *Warming by Hot-water*, New Edition, 1891.

KEITH'S BOILERS

are almost exclusively used by Her Majesty's Government, at the Home Office, and for the Heating Work of the Prisons throughout the United Kingdom, in preference to all others.

KEITH'S PATENT RAMS & HYDRAULIC RAM-PUMPS, For Raising Water. Self-acting.

The very HIGHEST EFFICIENCY attained in Self-acting Hydraulics, by KEITH'S RAMS.

KEITH'S PATENT "UNIVERSAL" RADIATORS, For Hot-water Heating. Made in One Piece, and in many Sizes and Modifications. No Joints to Leak. Thousands in use.

Manufactured under thirty James Keith's Patents in Great Britain, United States, and Canada.

JAMES KEITH (C.E., Assoc. M.Inst.C.E.), Gas, Hydraulic, Heating, Ventilating, and Consulting Engineer. Established 1823. Contractor to Her Majesty's Government. 57, HOLBORN VIADUCT, LONDON, E.C., ALSO AT EDINBURGH AND ARBROATH.

On view morning of Sale, and Catalogues had.

Expiration of Lease.

THIRD CLEARANCE SALE of CHOICE ORCHIDS. UNRESERVED SALE.

From Messrs. Charlesworth, Shuttleworth & Co., of Heaton, Bradford, Yorks, and Clapham, S.W., comprising—
CATTLEYA LARIATA, with sheaths; LELIA PURPURATA, LELIA GRANUIS TENEROSA, the true variety; ODONTOGLOSSUM CRISPUM (ALEXANDRIE), PACHO type; O. PESCATOREI, ODONTOGLOSSUMS in varieties, ONCIDIUMS, MASDEVALLIAS, CYPRI-PIDIUMS, &c.

FOR SALE by AUCTION, by

MESSRS. PROTHEROE AND MORRIS, at their Central Sale Rooms, 67 and 68, Cheapside, E.C., on **FRIDAY NEXT, December 2, at half-past 12 o'Clock precisely.**
On view morning of Sale, and Catalogues had.

Friday Next—Orchids in Flower.

MESSRS. PROTHEROE AND MORRIS will include in their SALE, on **FRIDAY NEXT, 100 lots of ORCHIDS IN FLOWER**, from two private Collections, including well-grown Plants and Choice Varieties.

Tuesday, December 6.

IMPORTED ORCHIDS from Mr. F. Horsman.

MESSRS. PROTHEROE AND MORRIS will SELL by AUCTION, at their Rooms, on **TUESDAY, December 6, an importation of Orchids, of about 400 lots.**

Teddington—Freehold Nursery.

MESSRS. PROTHEROE AND MORRIS will SELL by AUCTION, at the Mart, Tokenhouse Yard, London, E.C., on **WEDNESDAY, December 7, the Freehold Nursery**, situate in the rear of Walpole Road, Teddington, with three Greenhouses, heated by hot-water piping, stabling, and sheds standing thereon, let to Mr. Pollington, on lease, at £25 per annum.

Particulars may be had at the Mart; of Messrs. KERLEY SON AND VERDEN, solicitors, 14, Great Winchester Street, E.C.; and of the Auctioneers, 67 & 68, Cheapside, London, E.C.

GREAT NORTHERN RAILWAY.

10,000 ORCHIDS.

AMONG THEM MANY SPECIMENS of EXTRAORDINARY SIZE. THE WHOLE IN SUPERB CONDITION.

MESSRS. PROTHEROE AND MORRIS have received instructions from Messrs. F. Sander & Co., St. Albans, to SELL by AUCTION, on **FRIDAY, December 9, about 10,000 ORCHIDS.**

The whole are extra fine plants and among them are specimens of unusual size and value.

In consequence of the erection of a Railway Station on the Nursery Premises by the Great Northern Railway Company, Five Orchid Houses are being pulled down—and hence this enormous lot of Orchids are offered WITHOUT THE LEAST RESERVE.

Thousands of Cattleyas and Odontoglossums will be included, and a host of rare Orchids and big specimens, a list of which will be published next week.

Dutch Bulbs.—Great Unreserved Sales.

MONDAY, TUESDAY, WEDNESDAY, THURSDAY, FRIDAY, and SATURDAY NEXT.

MESSRS. PROTHEROE AND MORRIS will SELL by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., **EVERY DAY NEXT WEEK, at 12 o'Clock, large consignments of first-class—**
NARCISUS, CROCUS, HYACINTHS, and other Bulbs from Holland. Lotted to suit the Trade and Private Buyers. About 3500 lots, without reserve.
On view morning of Sale, and Catalogues had.

Cheshunt.—Great Sale of Fruit Trees.

Important to FRUIT GROWERS, MARKET GARDENERS, and GENTLEMEN requiring FRUIT TREES for planting to bear next season.

MESSRS. PROTHEROE AND MORRIS are instructed by Messrs. T. & G. Oyer (who are compelled to clear the ground), to SELL by AUCTION, on the Premises, the Elms Fruit Ground, Park Farm, Cheshunt, 1½ mile from Cheshunt Station, on **THURSDAY, December 13, at 12 o'Clock precisely, 17,000 clean-grown Bush and Standard FRUIT TREES, 4 to 6 years old, all in splendid condition for transplanting, consisting of Lord Suffield, Wellington, Early Julian Keswick Collin, King Pippin, Hawthornden, Warner's King, and many other Apples; 300 Pound's Seedling Plum Victoria, New Orleans, and other varieties; and about 600 William, Hazel, Calabash, Beurré de Capiaumont, and other Pears.**
May be viewed any day prior to the Sale. Catalogues may be had on the Premises; of Messrs. T. AND G. OYER, Spitalfields Market; and of the Auctioneers, 67 and 68, Cheapside, London, E.C.

N.B.—The Auctioneers desire to call attention to this important Sale. The trees have been grown by Messrs. Oyer expressly for planting in their own grounds, and consist of such varieties as they have found from their experience to be most profitable for market purposes. The trees have been specially prepared for removal to the new Farm which the Vendors were about to take, but the negotiations having fallen through, with regard to planting it with trees, Messrs. Oyer are compelled to sell them for want of room.

Choice Bulbs from Holland.

MR. J. C. STEVENS will SELL by AUCTION, every **MONDAY, WEDNESDAY, THURSDAY**, and frequently on **SATURDAY**, at his Great Rooms, 38, King Street, Covent Garden, W.C., grand importations of choice BULBS arriving daily from renowned Farms in Holland, in excellent condition, and lotted to suit all buyers.

On view mornings of Sale, and Catalogues had.

Tuesday Next.

London County Council.
PARKS AND OPEN SPACES DEPARTMENT;
ASSISTANT TO THE CHIEF OFFICER.

THE LONDON COUNTY COUNCIL is about to APPOINT an ASSISTANT to the Chief Officer of the Parks and Open Spaces Department. The duties attached to this post will be to Assist the Chief Officer in matters relating to Horticulture in the various Public Parks and Gardens in London, and in Supervising and Directing the Management of the Open Spaces, and the Laying-out of New Grounds, and generally to act in Outdoor-work, under the direction of the Chief Officer. Applicants must therefore possess a thorough knowledge of the science and the practice of Horticulture, and general experience in the Management of Parks and Gardens.

The salary attached to the office is £300 a year, but there will be no superannuation or pension. The office will be held during the pleasure of the Council, and the holder will be required to give his whole time to the duties of his office and will not be allowed to take any private business, to hold any other appointment, or to occupy any other paid position. Applications, containing particulars of the qualifications and experience of the applicant must be on the forms to be obtained at this office, and must, with copies of recent testimonials attached, be addressed to "The Clerk of the London County Council, Spring Gardens, S.W.," and be endorsed on the outside "Assistant Superintendent, Parks."

They must be delivered here not later than 10 A.M. on the morning of December 9, after which time no application will be received. Any application which does not contain all the particulars above-mentioned, or which in any other respect fails to comply with the terms of this advertisement, will not be laid before the Council. Personal canvassing is strictly prohibited.

H. DE LA HOOKE, Clerk of the Council,
Spring Gardens, S.W., November, 1892.

PEACHES and NECTARINES.

A Private Gentleman has a Collection of magnificent Dwarf-Trained and Standard-Trained Peaches and Nectarines for Disposal. The heads vary from 7 feet to 12 feet across, and are in the finest possible condition and shape. For those about to plant, this is a very rare opportunity to acquire really grand Trees of Best Varieties. Cheap. Measurements, &c., will be furnished on application.

C. E. J., Messrs. Homer, Price, & Co., 14, Castle Street, Long Acre, London, W.C.

DOUBLE NEAPOLITAN VIOLETS.— Splendid large Clumps, crowded with Bloom Buds. Will Flower all the Winter and Spring. Beautifully sweet. First size clumps, 12s. per dozen; second size, 6s. per dozen. Large Czar Violets, half above prices. FOREMAN, Stanmore Park Gardens, Middlesex.

VICTOR POTATOS (SHARPE'S).

This favourite first early Potato, suitable for any Garden, indispensable for Forcing and Early Borders, and likely to take the first rank amongst first earlies for market use. Quality and yield all that could be desired. One well-known market grower has this year had a yield of 15 tons per acre on a large acreage. London and Manchester salesmen speak highly of their quality, and report that Victors will keep their bloom and have a fresh appearance after being in the market some days, when other early Potatoes have become discoloured and unsaleable.

The stock we offer is the true yellow-fleshed variety and not the white variety, which is often substituted.

Price per cwt. and ton. State requirements to

W. W. JOHNSON & SON, Seed Growers and Merchants Boston, Lincolnshire.

THOMAS GREEN & SON, LTD.,

LEEDS and LONDON,

HORTICULTURAL ENGINEERS to HER MAJESTY THE QUEEN, call Special Attention to their Patent Wrought-Iron Municipal or Angular Chambered and Tubular

HOT-WATER BOILERS,

And others with SHELVES, and HOLLOW or ORDINARY CAST-IRON GRATE BARS.

SADDLE BOILERS, With WATERWAY BACKS and WELDED BOILERS, any of which are specially adapted for Heating Greenhouses, Conservatories, Churches, Chapels, Schools, Public Buildings, Entrance Halls, Warehouses, Workshops, &c. They are the neatest, cheapest, most effective, and durable of any extant.

The MUNICIPAL and TUBULAR ones are remarkable for their great heating power, slow combustion, and the length of time the fire will burn without requiring attention.

These Patterns secured the **FIRST and HIGHEST PRIZE—a SILVER MEDAL**—at the Royal Horticultural Society's Exhibition, South Kensington, London, June 1, 1881.

MUNICIPAL PATTERN BOILER, THE BEST EXTANT.

The longitudinal section gives a view of the fire-box, water space, flues, &c. The cross section gives a view of the fire-box, water space and V-shaped back. The front elevation shows it set in brickwork, which is necessary for this class of boiler.

TESTIMONIALS.

Re HEATING APPARATUS. Borough Engineer's Office, Municipal Buildings, Leeds, January 9, 1886.
MESSRS. THOS. GREEN AND SON, LTD., NORTH STREET, LEEDS.
 GENTLEMEN,—I have great pleasure in bearing testimony to the efficiency and satisfactory working of the Hot-water Heating Apparatus you erected in these public buildings.
 The buildings are four storeys high, and we have a total length of about 28,000 feet of piping in them, varying in size from 1½ in. to 6 in. diameter, with their connections, &c. The several offices and rooms can all be in operation at one time or separately, and the heat regulated by means of the valves to the temperature required, even in the coldest weather.
 Two of your Patent Municipal Pattern Boilers, No. 4, work the whole of this piping easily, although we have three of them fixed. They are very powerful and economical in the consumption of fuel, and I am pleased to be able to report of them and the apparatus so favourably.
 I am, Gentlemen, yours truly,
THOS. HEWSON, Borough Engineer.
 Morley House, Bagot, St. Saviour's, Jersey, November 10th, 1886.
 GENTLEMEN,—The large Municipal Boiler which you sent me last year is doing its work satisfactorily; it is heating 5000 feet of 4-inch pipe in one of my vineries, and I am quite sure that it has power to work a much greater length, while in cost of fuel it compares favourably with my other Boilers.
 I have now five of your Boilers in use, and I cannot speak too well of their heating powers, or their comparatively small consumption of fuel.
MESSRS. THOS. GREEN AND SON, LTD., LEEDS.
 Yours faithfully, (Signed) **G. W. BASHFORD.**

BEAUTY OF BATH
 (THE COMING APPLE).

THIS is the finest, New, First Early Dessert Apple introduced for many years. It has gained honours at every Exhibition where shown; First-class Certificate Royal Horticultural Society; and First Prize for the Best Dessert Apple in competition with thirty-five dishes staged, and was included in the First Prize Dish of Dessert Apples at the recent International Fruit Exhibition, Earl's Court, open to all England, August 26 and 27, 1892. Mr. Horne, of Perry Hill, Cliffe, near Rochester, holds the largest stock of this magnificent Early Dessert Apple in England.

CLIFFE, near ROCHESTER.
 SECOND PORTION of Mr. HORNE'S IMMENSE STOCK.
 IMPORTANT to FRUIT GROWERS, MARKET GARDENERS, and OTHERS.

Messrs. PROTHIEROE & MORRIS
 have received instructions to hold a Great FRUIT TREE SALE, on the Premises, Perry Hill, Cliffe, near Rochester, on WEDNESDAY, November 30, comprising:—
 2,500 of the New Dessert APPLE Beauty of Bath.
 500 one and two-year Bismark's (New) APPLE.
 20,000 Standard, Half-standard, and Maideo APPLES.
 25,000 Bob and Lad GOOSEBERRIES.
 25,000 Balwin BLACK CURRANTS.
 2,400 John Ruskin STRAWBERRIES, for forcing.
 75,000 Paxton, Noble, and John Ruskin STRAWBERRIES, from open ground. (BERRIES.)
 30,000 Sir John Falstaff, Carters' Prolific, and Semper Fidelis RASP.
 25,000 three-year Connover's Colossal ASPARAGUS, &c.
 Luncheon at 11, Sale at 11.30.

Catalogues may be obtained on the Premises; and of the Auctioneers, 62 and 68, Cheap-side, E.C., who will be pleased to execute commissions for Gentlemen who cannot attend, and desire to call attention to this important Sale. It is seldom an opportunity is offered for securing new and rare kinds in such large quantities. All are well-grown and healthy; the standards especially strong and straight. Fruit-growers and others who intend planting this season are invited to inspect the stock and attend the Sale.
 Mr. Horne will lift and put on rail all Lots (after the Sale) free of expense.

THE COLORADO BLUE SPRUCE,
PICEA PUNGENS GLAUCA.

Handsome specimens, 2, 3, 4, 5, and 6 feet high. These are all of the *Blue* type, and undoubtedly the finest plants in Commerce. They are all Seedlings, the plants usually met with being grafted on the Common Spruce Fir.

ANTHONY WATERER,
 KNAP HILL NURSERY, WOKING, SURREY.

FERNS A SPECIALITY.

ILLUSTRATED CATALOGUE of FERNS

(No. 22), 2s. post-free.

It contains 150 Illustrations, and an immense amount of interesting and instructive matter of great value to all Fern Cultivators.

SPECIAL AUTUMN LIST NOW READY,
 FREE ON APPLICATION.

W. & J. BIRKENHEAD, F.R.H.S.,
 FERN NURSERIES, SALE, near MANCHESTER.

CHOICE SEEDS

JAS. BACKHOUSE & SON

Beg to invite the attention of Gardeners and Seedsmen to the following:—

BACKHOUSE'S EBOR PEA.

This is an excellent Pea of the No Plus Ultra class. Whilst possessing all the good properties of the best type of No Plus Ultra, it is from two to three weeks earlier; a characteristic which both in private and market gardens must cause it to be largely grown as a main-crop Pea.

Per pint, 2s. 6d.; per half-pint, 1s. 6d.

BROCCOLI. Backhouse's Winter White
 Protecting.

This popular sort has stood the test of twenty years' cultivation. Obtained originally from Snow's Winter White, it is now in season from January to March. Its pure white heads are well protected by enfolding leaves—enabling it to stand 15° to 20° of frost without injury—and supplying the table at a time when vegetables of delicate flavour are exceedingly scarce.

Per packet, 1s. Per ounce, 2s. 6d.

BRUSSELS SPROUTS. Extra Select
 Dalkeith.

We have much pleasure in recommending this as the finest type of Sprouts we know. First-class Certificates were awarded it at the York Chrysanthemum, Fruit, and Vegetable Shows in 1888 and subsequent years. It is of vigorous growth, with densely set, compact sprouts; most prolific, firm, and hardy.

Per packet, 6d. Per ounce, 1s. 6d.

YORKSHIRE FAVOURITE MELON.

Having grown this Melon for some years, we have much pleasure in recommending it for general cultivation. It was raised by Mr. W. Bonsall, Manager of our Harrogate Branch Nursery, by hybridising William Tillery with Read's Scarlet-fleshed. The result is a handsome beautifully netted, well formed, scarlet-fleshed fruit of excellent flavour, unsurpassed for Table or Exhibition. If not so large as William Tillery, it is of good Exhibition size (3 to 4 lb.), and of superior appearance and quality; and as such we anticipate it will be in great request, and become a permanent favourite with cultivators.

Price per packet, 2s. 6d.

The above can be obtained wholesale of:—
 Messrs. HURST AND SON, 152, Houndsditch, London.
 Messrs. NUTTING AND SONS, 106, Southwark Street, London.
 Messrs. JACOB WRENCH AND SONS, London Bridge.
 Messrs. COOPER, TABER & CO. (Limited), 90, Southwark Street, London.
 Messrs. DICKSON, BROWN AND TAIT, Corporation Street, Manchester.
 Messrs. HARRISON AND SONS, Seedsmen, Leicester; or of

JAMES BACKHOUSE & SON,
SEEDSMEN, YORK.

CAPE BULBS!!

A Large Collection of the best kinds grown for Sale, and will be ready for export from January to the end of March.

PRICE LIST, free on application to—

MR. H. J. CHALWIN, Superintendent,
 BOTANIC GARDENS, CAPE TOWN;
 OR TO
Messrs. DAVIS & SOPER,
 BURY STREET, ST. MARY AXE, E.C. (London Agents).

THE
Gardeners' Chronicle.
 SATURDAY, NOVEMBER 26, 1892.

FERNS AT KEW.

IN these days, when the more profitable trade in what are called "Market" or "Decorative Ferns," which are easily raised from spores, has, in nurseries, absorbed the greater part of the space formerly devoted to collections of Ferns, it is pleasant to note that the matchless collection at Kew has of late years received an increased rather than a diminished amount of attention; and that its value, both from a botanist's and from a gardener's point of view, has increased in a corresponding degree, as the facilities for seeing rare and curious species elsewhere has decreased. But not only has the improvement been in the scientific interests of the Kew Ferns, but the plants themselves have gained in health and vigour, and especially in the large No. 2, or tropical Fern-house, where the cultural efforts of the staff must have been formerly severely handicapped by having to make the best of a structure glazed, in accordance with some "fad," with green glass. From a great part of the house, the green glass has been removed and replaced by the white glass in common use, and over that part the improvement of the specimens has been so marked and rapid, that it is difficult to understand why the remaining portion should not obtain the same relief. As it is, the fine collection of Gymnogrammas, which, one and all, require pure air and a clear light, have still to be grown under this green glass; and so also with other important genera. With the means at command, more could not be done than is done at present in the Kew collection, for everywhere is evidence that the smallest peculiarity or known liking of a plant is not neglected. Thus in the genus Davallia, we note that on each side of the door are placed two fine specimens of Davallia elegans, clothing from bottom to top the tall Fern stems placed for them to run over; while other species are grown in baskets or pots; and the lovely mass of the little Davallia parvula has a case constructed to receive it. So also with the Adiantums: some, like the elegant viviparous A. lunulatum dolabriforme, are suspended, and form spherical masses of delicate frondage; while others are grown in baskets or pots, as they may be adapted for them. In such an establishment, and with such a vast collection from all parts of the world, it must be remembered that, in the arrangement of the plants, many things have to be considered; and above all that, specimens should not be lost sight of in the efforts to create effect. And yet it would be difficult to improve the existing state of things in the tropical Fern-house, except in the matter of having the re-glazing of the roof seen to. There, grouped together, are the noble specimens of the Platyceriums, or stag-horn Ferns;

beyond, all together, a complete collection of Selaginellas, cultivated up to their best. Suspended over the Platyceriums are the quaint and gigantic tropical Lycopodiums, of which the most singular, perhaps, is *L. squarrosum*. Along the entire length of the structure, the pillars are densely clad by the different species of the climbing Lygodium, the *L. dichotomum*, with its thick, deeply-cleft fronds, being specially effective. In a shady part of the house is the collection of Filmy Ferns; and, indeed, everything seems placed so as to look well, and thrive also. Among the countless rare species, are the singular *Lomariopsis luxifolia*; the trailing *Asplenium scandens*, which requires a critical examination before one can realize that it is an *Asplenium*; the remarkable *Ophioglossum pendulum*, illustrated in the *Gardeners' Chronicle* recently; the strap-leaved *Vittarias*; the spiny Tree-Fern of Jamaica, *Alsophila armata*; the stately *Dicksonia Wendlandi*, *Lindsaya retusa*, *Brainea insignis*, *Pteris ludens*, and a number of others.

The new temperate Fern-house is now finished, and the plants placed in their new quarters, where they will have an immense advantage over what they had in the old, dark, and inconvenient structure, where it must have been impossible to carry many of the delicate *Nothochloenas* and *Cheilanthes* through our protracted winters; and, in their old station in the lofty Aroid-house, the tropical Tree Ferns mingle well with the Aroids, some of the scandent species twining round the stems of many of them.

There seems to be a growing love for Ferns; and, if more of our young gardeners would try and get a year in the Royal Gardens at Kew, it would, if they applied themselves diligently, give them more real knowledge of Ferns, and plants generally, which would be of service to them, than years of the desultory studies even the most intelligent of them pursue, where they have not the advantage of association with the plants themselves, which they would there enjoy.

CORDON PEARS.

ALTHOUGH this mode of cultivating the Pear is considered trifling by some, and does not meet the requirements or convenience of others, it has nevertheless irrefragable advantages in some respects, which are apparently becoming widely appreciated, if we may judge by the increased demand for trees of this form. To those possessing only a limited run of walls or trellises, who are desirous to obtain therefrom as long a succession of fruit as is possible, the cordon is invaluable, for it is certainly unequalled as a fruit-bearer, besides having other advantages, and the fruit that cordons bear whilst quite young are of the largest size and best quality. The management is simple, its rooting space very small, and it quickly covers walls, &c. The length of time that trees which have their growths much restricted will produce good crops, is a question often asked, and one which I admit I am not qualified by experience to answer, notwithstanding the fact that we have some 350 cordon Pears upon walls, the oldest which cover a wall 15 feet in height; but these have been planted only four years. At the same time having seen the noted trees at Holme Lacy in bearing, during the time Mr. Denning was in charge of them, I think I may safely assert that cordons can be kept in a satisfactory state for as long a time as any other form of tree that is confined to a given space.

Cordons are grown with a single or with two stems or branches, but the former if the stock is the Quince is usually preferred. Such plants should be set out 2 feet apart, if the finest fruit is looked for or expected; or they may be put at 18 inches apart, and trained either erect, obliquely, or horizontally,

as suits convenience or taste, although it has been said, for reasons that are apparent, that those fixed perpendicularly are not so fruitful as those which are inclined to one side or the other—but this is not substantiated by my experience. The Pear, like other fruits, pays for care in planting, and I planted the cordons here in the following manner:—Holes 3 feet wide, and the same in depth, were dug out at the foot of the walls, the borders being old, furnished years ago with tile drains. Brick rubble to the depth of 6 inches, and covered with turves, was

FIG. 95.—DIAMOND FENCE OF APPLES.

placed in the bottom of each hole, the remaining space being firmly filled to within 6 inches of the top with moderately-heavy maiden loam, but having no old mortar or lime mixed with it, because these were not at command. Upon this the trees, after cutting off the jagged ends of the roots, were placed in position; the roots spread out, and covered with about 4 inches of soil, fine particles being worked amongst them with the hands, and a mulching of stable-manure completed the planting. Of course, every one is not favoured with maiden soil at hand,

FIG. 96.—SPIRAL CORDON APPLE.

but that is not a vital matter, for the Pear can be grown well in most soils of a loamy character, be they light or heavy; one matter of importance must not, however, be overlooked—that of securing perfect drainage.

Pruning simply consists of shortening the shoots in July, and again in October, cutting these growths back to two leaves from their base, and removing unfruitful spurs, or those that are superfluous; while in order to preserve a balance between root and top, and thereby assist to keep the trees fruitful, the former, particularly those

of free-growing varieties, must be cut-in periodically, or as is found necessary. Feeding with liquid manure, or some other surface-mulching, should be practised, especially soils which are light or poor. Respecting aspect, I may mention that the trees in this garden are on south, east, and west aspects, and good fruit is gathered from each. The greatest enemy that we have are the spring frosts, which are intensified by our moist situation.

We have merely a good selection of varieties of Pears, and of these the following are the best bearers, and moderate growers:—Beurré d'Anjou, Doyenné du Comice, Durondeau, Easter Beurré, Josephine de Malines, Louise Bonne de Jersey, Marie Benoist, Marie Louise, Olivier de Sérres, and Winter Nelis, all varieties of good quality. The more or less unfruitful ones, and the most luxuriant growers, are Beurré d'Amanlis, General Todleben, Bergamotte d'Esperen, and Beurré Hardy; the last, however, is studded with fruit-buds at the present time. Of these, Doyenné du Comice excels in point of flavour, and I should like to call attention to the good qualities of Beurré d'Anjou, and Marie Benoist, which, I think, are not so much cultivated as they deserve to be. *T. Coomber, The Hendre, Monmouth.* [See also "Hardy Fruit Garden," p. 645.]

BERLIN LETTER.

(Continued from p. 614.)

I HAVE already said that the present fashion in bouquets and florists' work generally, as distinguished from the past, permits the use of a number of subjects which were formerly not admitted into the better sort of bouquets. It may be of use if I specify what these are. The first are the novelties in Dahlias. Whilst the blooms of *Dahlia variabilis* always look stiff and formal, and can only be made use of in a loose, unconfined kind of arrangement, the blooms of *D. Juarezi*, on the contrary, notwithstanding their large size, possess grace and variety of form and colouring which few flowers of such a size can rival, that they are well suited to various forms of arrangement. I might say that they are the equals of the large-flowered Clematis.

The vermilion-red fruits of the Winter Cherry, *Physalis Alkekengi*, are much admired in baskets, &c., and very pretty these look when, as is often the case, the calyx is opened by four snips with the scissors, and its four sections spread out flat, showing the cherry-like fruit surrounded with four rays, just as the earlier painters used to depict the sun.

Autumn leaves, especially those of the different species of American Oaks, which possess lasting properties and tender tints, lend themselves excellently to the bouquet-makers' art. But what makes these leaves of special value is their noble forms, and not the least of the reasons for their general employment, is the great length of time which they will last when cut. Besides the autumn-tinted foliage of the Oaks are those of *Læonies*, whose fine tones of colour make them excellent materials. There is little doubt that the quantity of autumn leaves used by bouquet-makers will, by next autumn, have assumed still larger proportions. Besides these variegated leaves, many various-tinted fruits are made use of. It is not rare to see the fruits of *Sorbus aucuparia*, *Mespilus Pyracantha*, *Ligustrum vulgare*, *Mahonia aquifolia*, *Ampelopsis hederacea*, &c., in bouquets. One of the most charming arrangements I have noticed was one sent by Herr Commercial Privy Councillor Veit, to a small exhibition of fruit at Steglitz near Berlin. It consisted of an oval table, about 1½ yard in diameter, upon which enormous bunches of Grapes out of H. Veit's vineries, were spread about, and were interspersed in the prettiest manner with autumn leaves and numerous fruit-bearing shoots of a great variety of shrubs and trees. I shall shortly have something to say concerning the park and the vineries of this amateur horticulturist.

Frequently the flowers of *Mina lobata* are made use of. This novelty in hardy climbing plants,

which in a sunny position out-of-doors, makes in one year an enormous bush, is in autumn bedecked with innumerable red and yellow flowers. Not of less value are the pretty cinnabar-red flowers of *Tritonia* (*Monbretia*) *crocosmiflora*, which are well adapted for similar purposes to the foregoing. The blooms of the small-flowering varieties of *Bouvardia* are likewise employed, and particularly the double-flowered *Alfred Neuner*, and a scarlet-coloured variety.

Amongst plants grown in pots for sale, mention should be made of those most in favour, viz., *Erica gracilis*, *E. hiemalis*, *Cyclamen persicum*, *Bouvardia Humboldtii*, *Primula sinensis*, small *Chrysanthemums*, and numerous varieties of *Fuchsias*; to these may be added, *Camellias*, *White Roman* and other *Hyacinths*; and *Gardenias*, not forgetting the immense quantity of *Violets*, which every day are sold, to the value of several thousand marks. *Dr. U. Dammer*.

different shades in bronze, is a good bloom, but the habit appears to be not of the best, growing some 7 feet high. *Sugarloaf*, introduced from America about three years ago, is still worthy of a place anywhere; it is an incurved Japanese, crimson, with gold reverse, and produces good broad petals. A very good decorative variety is *Thos. Steveson*; it produces a very wealth of medium-sized blooms in many-flowered clusters. A visit to Forest Hill is always interesting, and we noticed the great quantity of *Begonia-tubers* housed, and being subjected to the drying process, previous to their distribution. In the *Orchid-houses* were several good things in bloom, including a pretty, and well marked variety of *Odontoglossum crispum*.

MESSRS. REID AND BOHNEMANN, SYDENHAM.

A visit some ten days since to this establishment showed that many novelties were still in bloom, and the collection seemed to possess more late varieties

not space to notice any more, but there are a number of good things yet in bloom at this nursery, which it is intended to devote specially to florists' flowers.

MESSRS. CARTER & CO., FOREST HILL.

A good display of *Chrysanthemums* has been maintained at this establishment during the last few weeks; but when a week ago we visited this nursery, the majority of the flowers were past their best, and some of the plants had been cut down and taken out of the house. Some of those still remaining carried good blooms, and several new American varieties were in evidence. With their own seedlings, however, Messrs. Carter appear to have had but indifferent success, and not many out of a large batch will be worth keeping. Such are the disappointments which often await the would-be raiser of improved forms, and it is only in special cases, and but seldom, that he is rewarded with a bloom, in the shape of a novelty surpassing any previously-raised variety. Novelties are produced in number, but such is not sufficient to command success, they must have other recommendations before they become the rage of the hour.

The general display this year, however, has been much in advance of that attending previous efforts of Messrs. Carter, and the group staged by them—and successfully—at the Crystal Palace, was one of the best seen this year.

FIG. 97.—SINGLE CORDON APPLE. (SEE P. 640)

CHRYSANTHEMUM JOTTINGS.

MESSRS. JNO. LAING & SONS.—Many a good display of the favourite autumn flower has been seen at Forest Hill, when Messrs. Laing & Son were amongst the well-known exhibitors, especially of groups. Since 1890, however, Mr. Laing, through pressure in other departments, has been obliged to give up growing *Chrysanthemums* for exhibition. However, some 500 plants have been grown this year, and a good display has been the result, although the requisite accommodation inside has been partially withheld for other purposes. Many of the plants had completed their work before our visit, and some dozens of them were being cut down and carried away at the very time. A goodly number, of course, were still in bloom, and amongst these were many good specimens. *Vivian Morel*, in good condition, was the first to attract our attention; and *Owen's Excelsior*, which—pretty colour as it is

than several collections we had seen. The following are amongst those that specially attracted our attention:—*Mr. J. Fogg* has been seen in many stands this autumn; it is a Japanese of *Sunflower* type, but deeper bloom, and colour not so deep. *Emil Odeck*, an incurved Japanese, colour deep velvety-crimson, with bronze reverse. *Waber* is a Japanese incurved, or perhaps pure incurved another season; its flowers are blush, petals twisted and curled; sent from America last year. *Ida Prass*, an American Japanese, incurved, flesh-coloured, full flower, and good. *Lizzie Cartledge* is a very full, large Japanese, of lilac-rose, with silvery reverse; habit is too tall. *Elmer D. Smith* is a velvety-crimson Japanese, with buff reverse; petals are twisted, and are very broad, partly drooping—a very good thing. *Commandant Maraignon*, a Japanese of dark chestnut-crimson, of *Jeanne Delaux* type, but brighter; a French variety of this year, exceedingly promising. *Mr. Briscoe Ironside*, one of *Mr. H. J. Jones'* Japanese

FIG. 98.—DOUBLE CORDON APPLE. (SEE P. 640)

—would be a valuable Japanese if, through cultivation, it would throw a better centre. *Jno. Stanborough Dibbens* may, perhaps, make a good thing, but it is far too rough to be ranked as an incurved; as a Japanese incurved, another year it may be valuable. *C. B. Whitmore*, another incurved Japanese, colour crimson, with light rose reverse, has better form. *Abber Mendenhall*, a new Japanese, is a very good thing; the florets are long and fairly wide, the colour yellow, and the variety promises well to become a useful one for exhibition. The pretty *G. C. Schwabe*, with its rich crimson petals and gold reverse, was in evidence; and *Vice-President Audiguier*, a very pretty Japanese, white, with a suffusion of rose, looked well. *Mr. A. H. Neve* was carrying some good blooms. It is a broad-petalled Japanese reflexed, white with pale blush centre, blooms large, and rather heavy. *E. G. Hill*, an incurved Japanese with buff ground, and stripes of

incurved; colour chestnut and bronze, petals twisted. *M. A. L. Rosseel* is a small decorative Japanese, colour blood-red, with gold linings and reverse; a very charming decorative variety. A good thing for next year is *W. P. Routh*, a very large Japanese flower of *Avalanche* type. The colour is beautiful primrose, and may prove one of first-class. *Yonitza*, a primrose and blush incurved flower, is good, but must be taken on the terminal bud. *Sydenham Terra-cotta* is the name given to a semi-single variety, very useful for decoration and for market. Its flowers are plentifully produced, in large clusters, and the colour is a good terra-cotta. *Le Verseau* is a very large Japanese, of bright rose, with silver reverse. *Alfred Lee* may prove a first-class flower for decorative purposes; it is one of the seedlings raised here this year—a Japanese, with the centre petals recurving, and outer petals spreading; colour somewhat lilac, but with a suffusion of flesh. We have

THE HOME OF THE SUGAR-CANE.

DR. EDMUND VON LIPPMAN, an eminent German chemist, and an authority on sugar, gives the following brief sketch of the history and development of Sugar culture and manufacture, in a lecture, a synopsis of which appeared in the *Deutsche Zucker Industrie* :—

The original home of the Sugar-cane must be looked for in the coast region extending from Beogal to Assam, at the northern extremity of the Bay of Bengal. It is remarkable that there is no such thing as the wild Sugar-cane, whilst four-fifths of other formerly wild, but now cultivated plants, are still in existence in a wild state. Not the slightest chronological indication as regards the time when it was first known is to be found in Indian annals. A Chinese compilation of the third century states, that the province of Bengal sent Sugar-cane as a tribute to China, from which we may conclude that at that time solid sugar was not known. The first indication of sugar itself is found between the third and sixth century in India, while the Chinese were not acquainted with its manufacture until about the year 640. In the ninth century, clarified sugar was prepared by drying raw sugar in the sun. The companions of *Alexander the Great* speak of a sort of honey, which they met with on their way to Asia, which grew there without bees. At the commencement of the sixth century, there was Sugar-cane on this side of the Indus, at the confluence of the *Euphrates* and *Tigris*. The conical shape of the sugar-loaf has existed since the seventh or eighth century. The refining was effected chiefly by the ashes of plants.

Sugar came first into Europe at the time of the conquest of Sicily by the Saracens in 827. From Morocco, the manufacture of sugar extended to Spain, and attained such a development that it amounted to 100 000 tons per annum. In the year 990, the *Doge Orseolo* concluded the first treaty of commerce with the Arabs, and refined sugar was then introduced into Venice. From thence sugar found its way into Germany, and is first mentioned in the poems of *Wolfram of Eschenbach* and *Gottfried of Strasburg*. *Columbus* took the Sugar-cane with him on his second voyage to America, but it appears to be again lost sight of there. In Germany, the first refinery was established in 1573, at *Augsburg*, by the patrician family of *Roth*. The next refinery was set up in 1597, at *Dresden*. *Louisiana Planter and Sugar Manufacturer*, as cited in the *Tropical Agriculturist*.

FOREIGN CORRESPONDENCE.

STEAM HEATING.

IN your editorial columns for September 17, you made a very appreciative review of the *Bulletin* from Cornell University upon the comparative merits of steam and hot-water for greenhouse heating. Your account of the manner in which a steam-plant should be made and managed, however, is entirely opposed to all practices in America, and it may be useful to English gardeners if I mention some of the main features in our system. Your comment upon this point is as follows:—"From what we know of the working and management of steam-heating apparatus in a large way, it is necessary to have the best quality of cast-iron piping, which must be at least double the thickness of ordinary hot-water piping, and the joints must be flanged and fastened together with bolts, and furnished with vulcanised indiarubber rings, to prevent the escape of steam. They must have accurately-fitted (turned) expansion pipes placed every 20 or 30 yards apart, to make the apparatus safe; and the boiler must have constant attention the whole time it is in use, a watch being always kept on the pressure-indicator. Another matter which calls for constant attendance is the fact, that it is neither desirable nor safe that steam should be always passing into the pipes. The usual practice is to let in steam for a time, sufficient to highly heat the pipes, and then turn it off, check the fire draught, and let the steam that is then made escape into a condenser, or up the chimney shaft, until the thermometer in the houses shows that it is necessary to let in more steam. In very cold weather steam has to be let into the pipes at short intervals; and perhaps in very cold climates, as that of the northern United States, steam would have to be constantly made during the night; but during the bright sunny days of that country, even in mid-winter, it would be but little needed about the middle of the day, except in forcing-houses. This would, of course, entail steam being made in a large boiler, to heat, we will say, but a fraction of the whole, although where all the houses had to be kept at high temperatures, that kind of expense would naturally be anticipated. Usually, when the pressures employed are low, the diameter of the pipes may range from $4\frac{1}{2}$ to 5 inches, but the larger the diameter, the larger must be the steam capacity of the boiler. Even for a small house, the large amount of heat afforded by pipes of large diameter is preferable to the higher pressure and strong dry heat entailed by the use of small malleable iron pipes. For large establishments steam is preferable to water even here, but it should always be controlled and looked after by a skilled engineer, and he should always be provided with a mate."

Cast-iron pipe is never used in America for steam-heating, and it is falling into disfavour for hot-water heating, especially in forcing-houses. We use wrought iron (or what you call malleable iron) pipes, gas-pipes, which screw together with threads. There is no more care necessary in putting these pipes together for steam than for hot-water; in fact, a pipe which will not leak steam often leaks hot-water. The old system of cast-iron piping is rapidly disappearing in America, even for conservatories. The gas or wrought-iron pipes are strong, cheap, easily adjusted to any position, and absolutely tight when properly put together. They can be carried anywhere in the house, they can be cut off at any place, and varied at any time in almost any conceivable manner. The same kind of piping is used for both steam and hot-water, as I have already said, and there is very little difference in the manner of laying the pipes in the two systems, except that for hot-water there must be more pipes, more heating surface, than for steam. For very many purposes we now use over-head heat; that is, we run our risers or flow-pipes overhead, and let the returns run back under the benches. We use small pipes. One 2-inch pipe is sufficient for a riser for a house 20 by 100 feet. This will supply from six to

ten 1-inch or $1\frac{1}{2}$ -inch returns. In our own houses all our piping is done by the gardener and a labourer. I have seen very many greenhouses in many States, and I never yet saw a cast-iron pipe in a steam-heated house, and I doubt if such a case occurs in America.

There is no expansion-tank whatever on any steam-system here. The steam or condensation returns constantly to the boiler, and is then sent out again through the riser as steam. There is enough elasticity in steam to take up any unnecessary or uneven pressure of ordinary amount. Every boiler is provided with a safety-valve, which can be set to blow off at any pressure desired, and if the pressure is too great, it is relieved through this valve. But with our automatic drafts, there is no reason for the safety-valve to blow off. Not the least harm results if it does go off. We never run a high pressure. Three or four pounds is usually sufficient, and the safety-valve is commonly set to blow off at seven or eight pounds. This leads me to say that steam-heaters, as we know them, require very little care, and no one is afraid of them. I heat my residence by steam. The heater (or boiler) is in the cellar directly under my study. I look to this heater twice or three times in the twenty-four hours! It is less trouble than a kitchen-stove. Everything about it is automatic so far as such a machine can be. In our range of houses we have a steam-heater and hot-water heater side by side, and one requires no more attention than the other; and if they are looked after in the evening at bedtime, in the morning, and again perhaps at noon, they give satisfactory results in all ordinary weather. We are just now completing the piping of some 12,000 square feet of glass from a 40-horse power steam-heater. I expect that there will never be a time, even in our cold winters, when a man will sit up with this boiler. My gardener goes home and goes to bed at 10 or 11 o'clock, and does not appear again until 6 o'clock in the morning. Then, again, steam is passing into our pipes all the time when heat is needed. If the sun comes out warm, a valve is turned on each pipe, and the heat is off. In a minute it can be turned on again.

I am not now urging steam in preference to hot-water. Each has its merits. I am only trying to describe the way in which we Yankees pipe our houses, whether by steam or water. *L. H. Bailey, Cornell University, Ithaca, N.Y.*

WINTER SALADS.

ALTHOUGH salading is not in so great request in winter as in the summer, yet most gardeners are expected to have it on their employer's table; therefore, steps should at once be taken to preserve any that is now out in the open, as severe frosts will spoil it. Endive, though considered by many to be hardy, is generally the first plant to suffer, and if the plants get in the least nipped with frost, decay is rapid. I find that one of the best means of giving protection to Endive, if the plants are to be blanched where they are growing, is to shake some clean fresh straw over their heads, which, if put on moderately thick, answers the double purpose of keeping off frost and blanching the hearts. This method answers for the Batavian or broad-leaved kinds, and the moss curled; but for the latter a different plan may be adopted, if it be thought requisite, which is that of laying a stout board along the row above the plants, the board being a non-conductor, will be found far better for the purpose than tiles or slate, as frost passes through either of those quickly, and being non-absorbent, wet condenses beneath, and helps rot the plants. Of course, where a quantity of salading is required, and the supply extended, and carried on through to the spring, a good deal of the Endive and Lettuce must be taken up, and preserved in cold pits or frames; but that for first or second use will be found to do well in any dry cellar or shed. I have wintered great numbers in sheds, by just putting 6 inches or so of soil on the floor, and laying

the Endive close together in it, and then setting the door open when the weather was favourable for giving air. Lettuces are best placed in frames or pits, as they need more light. The most suitable varieties for this season of the year are the Brown Cos and Hick's Hardy Green; but both Lettuce and Endive may be much improved in winter, if, a week or so before eating, they are placed in a Mushroom-house, the warmth and darkness blanching and rendering them tenderer than would otherwise be the case. If blanching is carried out in pits or frames, then all that is necessary is to exclude the light, by covering the glass, and keeping the lights close, the thing to be most watchful about being damp; but if decaying leaves are first picked off, and a trifling amount of air afforded at the back of the pit or frame, damp will not hurt the plants. *J. Sheppard.*

ROUND BIRMINGHAM.

(Continued from p. 556.)

THE BOTANIC GARDENS, EDGEMASTON.—A peep into these interesting gardens which Mr. Latham keeps in a condition which might be imitated with advantage in some similar establishments, revealed many interesting well cultivated botanical plants, as are the florists' flowers which are necessary for keeping up a show, and that without taking up space that should be devoted to botanical plants. We found the entrance enlivened with early Chrysanthemums, and a good large show of the general collection of these plants prettily arranged in the exhibition hall. The Chrysanthemum show here is enhanced by *Lapageria rosea*, *Bougainvilleas*, and other climbers which depend from the roof, and by the groups of scarlet *Salvias* and other winter-flowering plants arranged with ornamental foliage. In the lofty conservatory the Tree Ferns have grown marvellously of late years, some of their stems being 18 or 20 feet in height, and of these a grand *Cyathea medullaris*, a beautiful *Dicksonia squarrosa*, *D. fibrosa*, *Alsophila excelsa* and *Cyathea princeps* were remarked.

A beautiful Fern found in the gardens was *Dicksonia Lathamii*, which was raised by Mr. Latham, from *D. antarctica* and *D. arborescens*. It is a spreading variety, with broad and much divided fronds; dark green in colour, and hard enough in texture to make it an excellent conservatory or dwelling-house plant. Among the Ferns were lofty Palms, the largest of the *Chamarops excelsa* having a trunk of 20 feet in height, and beyond in the tank-house and adjoining stove-house were found some fine Palms and Cycads, with many interesting water and marshy plants, such as *Pontederias*, *Nymphæas*, *Godwinia gigas*, &c. Here *Callicarpa purpurea* will soon be in great beauty; and the brilliant orange-scarlet *Costus igneus* is a charming object. In other houses the collection of *Droseras* and other plants called insectivorous are very attractive although this is perhaps their shabbiest season; and the immense *Platynerium* in one of the warm houses show these curious Ferns in their best condition. Among them are fine plants of *P. grande*, *P. stemmaria*, *P. alcorni*, and other rare species, and the collection is one which a visitor should not miss. In the greenhouses were bright groups of *Primulas*, *Cyclamens*, *Begonias*, *Eupatoriums*, and *Bouvardias*; and among the last-named, it is curious to remark that one of the oldest species, viz., *B. leiantha*, was making the greatest show.

THE ORCHIDS.

More attention is given these plants every year, and their condition has improved, and there is a far better display of flowers than heretofore. In one of the warm houses *Cypripediums* were thriving. The plants were arranged with *Crotons*, and many rare species of Ferns, overhead being *Nepenthes*, *Platynerium*, *Davallias*, &c. In the *Cattleya*-houses a good display of autumn-flowering *C. labiata*, with a few *C. aurea* and other species in bloom were found. In another house, a number of grand plants of *Dendrobium formosum* giganteum, well furnished with their large white

and orange flowers; also *Dendrobium*, *Cypripedium*, &c. Overhead in the house in which were these plants, a noble plant of *Aristolochia gigas* has produced its large and wonderfully-marked flowers for the last two months, and may continue in flower till the new year.

Looking through the cool-house, we noted *Odonoglossum* in good condition, with some large plants of *O. grande* in bloom; and among the *Masdevallias*, the curious *M. pulvinaria* and a few other botanical species were in flower. Mr. Latham has not been unmindful of effect in the dull season, for he has done much by careful planting to compensate for the loss of interest in the outdoor garden when the flowering plants are over.

(To be continued.)

A TRAVELLER'S NOTES.

(Continued from p. 553.)

PENANG.—The Public Gardens, some 55 acres in extent, are, as I have said, about $4\frac{1}{2}$ miles from Georgetown. They are horseshoe in shape, quite encircled by a range of hills of about 500 feet elevation. All the ground is undulating. I do not think there can be a dozen consecutive level square yards in the garden. On account of the natural situation and the amount of water, the garden is extremely pretty, and when the newly-planted trees have grown larger, it will really be a very pretty spot. The place is so far young, Mr. Curtis not having been at work on it more

On the right-hand side of the house are some fine *Anthurium crystallinum*, foliage *Begonias*, *Anthurium Ferrierense* × in flower, *Eucharis* in flower, by the side of some strong pieces of *Adiantum peruvianum* and *Nephrolepis davalloides furcans*. At the end is a fine clump of *Angioperis evecta*, 8 feet high and not less than 10 feet through, as fine as I have ever seen it. Much of the rockery is covered with *Selaginellas* and other low-growing plants, amongst which may be mentioned *Acrotrema costatum*, interesting as being the only member of its order not a tree.

On the left-hand side of the house are *Davallias*, *Aspidiatra variegata*, *Curmeria picturata*, and another fine piece of *Philodendron gloriosum*. *Marantas* grow particularly strong, and *Heliconia rosea* is as strong and highly coloured as at Calcutta. *Cyrtodeira fulgida*, *C. chontalensis*, *Gymnostachyum* and *Fittonias*, as well as *Ficus repens*, help to hide the rock. They grow with great freedom, and are highly coloured. On a pillar near the entrance, *Ficus villosa*, with its clinging, overlapping leaves, is very pretty. *Caladium*, *Dracæna Goldieana*, and others also do well in this house.

On regaining the main road (which is 18 feet wide), and proceeding for a little distance, one has on the right, at the foot of the hill, a nice grove of the Betel-nut Palm (*Areca Catechu*). Though not so graceful as the Cocoa-nut, it has a tall slight whitish stem, and, with its small tuft of stiff leaves, is of great beauty. Near a fine *Ficus Roxburghii*, with the same immense cordate leaves I saw at Calcutta, is a good piece of *Livistona chinensis*. It does not grow so long and thin as with us in pots; here the foliage is closer, and the habit of the plant round and regular.

many offshoots. An *Areca*-like Palm—*Archontophoenix Alexandræ*—is also very pretty; whilst another, with stiff *Kentia*-like leaves, each one of which is at a sharp angle with the main stem, is not only pretty, but of economic value, as its stem, when split, being as hard as whalebone, is found very useful, and much used for fences; its name is *Oncosperma filamentosum*. Opposite a rain-tree the side of the hill is somewhat rocky and precipitous. Against this Mr. Curtis has planted *Philodendron* and *Pothos aurea*; the latter has magnificent highly-coloured leaves; the top is clothed with a natural undergrowth of *Gleichenias*. A large *Cymbidium*, on the stem of an *Alstonia scholaris*, attracts the attention of the new comer. The natives of Penang make from the stem of the *Alstonia* a sticky juice for catching birds.

The road leading to Mr. Curtis's bungalow is on this side of the garden, but before reaching it I noted one or two other plants. Near a Maltese cross-shaped bed of *Crossandra*, and a capital bed of blue *Plumbago* in full bloom, is a specimen of a common jungle tree, with pendulous, catkin-like-looking flowers, not unlike a Willow—*Crypteronia pubescens*. Near it is a piece of the true yellow-stemmed Bamboo. Another striking plant, belonging to the *Araliaceæ*, is *Brassia actinoptera*, lately received from Sydney; its foliage is much like an *Aralia*, but the leaflets, usually ten in number, and often 1 foot long, are cut to the base of the leaf. The Durian—*Durio zibethinus*—known for its powerfully-scented fruit—is represented near here, and on the bank of the stream, under shade, are some superb masses, great bushes of *Heliconia aurea*. I also noticed two or three *Alsophilas* with nice stems and even heads. Under the shade of a *Caryota urens* some *Crinum asiaticum* collected in the island were doing well.

The road to the bungalow winds tortuously up the small hill amongst the thickest jungle. Mr. Curtis has not yet been able to clear this away. It is beautifully shaded, and most wild and natural.

Opposite the road is the nursery, enclosed by a hedge of *Hibiscus* varieties. Beyond this, and before reaching the waterfall, the ground undulates considerably, and many single specimens, as well as a few clumps, have been planted; nothing has, however, yet attained any great size. Amongst the single specimens, *Bauhinia purpurea* was in flower, as well as the magnificent *Spathodea campanulata*; its flower is about the size of that of a Vegetable Marrow flower, orange and scarlet in colour. In Ceylon I saw trees covered with blossom—a most striking sight.

Araucaria Cookei forms regular specimens; and *Panax*, *Russelia floribunda*, *Sericographis Ghiesbreghtiana*, and *Acalypha torta* are used in some of the beds.

Opposite a young group of Palms on the top of a high knoll are some *Spathodea*, *Plumeria acuminata*, a grove of the fine *Cassia fistulosa*, and an old friend, *Mimusops Elengi*, with its thick, rich, glossy foliage. The Logwood, *Hæmatoxylon campechianum*, also does well.

The whole park is under grass, coarse but good, especially when it is taken into consideration that rain has not fallen for several weeks, and watering by hand has not yet been commenced. Where possible, "Doab-grass" has been laid down; but, as this is difficult to get, it is only used in the parts of the garden most in view.

Near a small bridge approaching the waterfall is a fine regular piece of the wild Cinnamon, 25 feet high, clothed to the ground with rich glossy foliage. On a hillock to the right are some *Wormia Burbidgei*, 4 feet high and not less than 5 feet through. Overhanging them were the long pendulous shoots of some *Bougainvilleas*. A tree much planted in the garden is *Calophyllum inophyllum*, its leaf, much like that of *Ficus elastica*, is thick and glossy; it was covered with pretty heads of white flowers with rich golden yellow stamens. The flowers are powerfully scented, a valuable oil is pressed from the seeds, and the timber is excellent. The habit is regular and even, and a tree in flower forms a pretty sight.

A small plantation of economics at the end of the garden includes Camphor, Nam-Nam, a native fruit; Cola Nut, like Cocoa, from Kew; Chinese Leeches, Jack and Bread fruits. This has been made too recently for any results, but in time the experience gained in this garden will doubtless prove useful to the planters in the island. Opposite this, near a *Poinciana regia* and young *Gravillea robusta* are different kinds of rubber plants, and some Liberian Coffee; a curious rubber is *Landolphia Kirki*, a climber from Africa.

FIG. 99.—CORDON PLUM TREE. (SEE P. 640)

than six years, the first of which was chiefly employed in clearing jungle.

A road completely encircles the garden, sufficiently wide for driving; and smaller paths wind in and out. On one side is Mr. Curtis's bungalow, on a hill of some 250 feet elevation, completely overlooking the whole place; it is a grand situation. There are three thatched houses dotted about, various glades, a large waterfall at one end, and two streams of water running through the gardens. Near the only entrance, on the side of the main road, is the largest of the plant-houses, covered with the split-leaf stalks of a Palm. Here are cultivated such plants as would burn, or could not otherwise stand the excessive heat without protection. On either side of the entrance are two strong bushy pieces of *Psychosperma Macarthuri*, about 10 feet high, very handsome when grown like this. Part of the entrance is covered with *Bignonia Chamberlaynei*. In the centre is a low undulating rockery of irregular shape, whilst on each side is a long low rockery, running the length of the houses. In the centre bed are some fine plants, notably a *Cycas circinalis*, 12 feet in diameter (each leaf being at least 6 feet long). *Anthurium regale* is particularly fine, and *Nepenthes phyllamphora*, running up one of the pillars supporting the roof, is noticeable. *Alocasia Johnstoni*, with its curious brown spiny petioles, grows nearly 10 feet high—not far from it is the best piece of *Anthurium Veitchii* I think I have yet seen out of England; it has now leaves $2\frac{1}{2}$ feet long. But perhaps the largest Aroid in the house is a magnificent *Alocasia* from Calcutta, the specific name of which is not known; and next comes a fine rather dwarf-growing *Philodendron gloriosum* some 9 feet through, overhanging a *Nepenthes ampullaria* and *N. Rafflesiana*, growing luxuriantly on the side of a small tank.

On the left of the road, not far from the entrance, is the band-stand, on a low grass terrace. Round it are circular beds filled with red and white *Vincas*, *Zinnias*, *Coreopsis*, and a pink-flowering plant, *Beloperone* sp. The handsomest of these beds is certainly the one filled with *Crossandra undulæfolia*. It is one blaze of bloom—the flowers of a beautiful brick-red tint. Mr. Curtis tells me it thus flowers for nine months out of the twelve.

Opposite the band-stand, right under the hill, covered with jungle, which bounds the garden, is a small thatched house, the roof being made from leaves of the Nipa Palm. Round the pillars supporting the roof are small circular rock-edged beds planted with *Marantas*, *Justicia carnea* flowering well, *Davallia Duffi*, *Tradescantia discolor*, and other small-growing plants of a like kind.

Behind this house for a few yards up the hill, the jungle has been cleared and planted with *Heliconia aurea*, *Anthuriums*, *Philodendrons*, and other Aroids. They are yet young, but growing with great luxuriance; the first-named, here, as in every other part of the garden, is most highly coloured. Cut into the grass, on the right side of the road near this spot, is a fine bed of *Gardenias*; whilst on the left, over a broad stretch of undulating grass, the garden can be seen stretching away to its opposite boundary. Its frequent undulations, numerous and varied single specimens of plants, the stream running through the centre, the great waterfall thundering at one end, and the whole enclosed by hills covered with vegetation as thick and luxuriant as one could well see, well repays one for stopping and looking across the garden from this point.

In a group of recently-planted Palms I noticed *Livistona Adansoni*, with its glaucous, twisted foliage, near a tall *Cocos plumosus*, and a thick piece of *Psychosperma Macarthuri*, 18 feet high, with

The waterfall, as I have said, is the main water-supply of Georgetown; from the new reservoir at its base, pipes run right through the garden. It is some 500 feet high, as it comes from the top of the hills surrounding the garden, but the fall of water is broken several times in coming down—it is the great sight of the garden. Beyond the waterfall the hill rises abruptly, and is of a rocky nature; so Mr. Curtis has planted Aroids, which will doubtless cover it in time.

Near a small pond on the right and on both its banks are Cacti and other Mexican plants. Mr. Curtis has determined to make this a feature in the garden, and to devote this spot to the object. With this idea he brought many of this class of plant out from Kew with him—they are, however, still too small to plant.

Beyond this is the finest plant in the garden, a magnificent *Grammatophyllum speciosum* on a rising mound, isolated from other plants, and surrounded by a shrubbery. We carefully measured it—its circumference is $42\frac{1}{2}$ feet, its shoots are from 6 to 7 feet long, its seed-pods with their stalks are $7\frac{1}{2}$ inches, without them 5 inches long; one of last year's spikes of which there were thirty, is $7\frac{1}{2}$ feet—the diameter of the seed-pods is $2\frac{1}{2}$ inches. The plant is in fine condition, nearly all the shoots being clothed with foliage of a good colour.

Beyond this plant the ground is much undulated—rising on the right, falling on the left. Near a very fair bed of Cockscombs and a very good one of Balsams, is a specimen of the Fishing-rod Bamboo from Siam—a tall, strong-growing pretty variety. I was also surprised to see a bed of the dwarf yellow-flowering Honeysuckle, blooming splendidly; it looked to me much like *Lonicera japonica*. In *Saraca indica*, with its immense heads of lxora-like flowers, I recognised an old friend; a nice specimen is opposite the small Lily-pond, where *Victoria regia*, and other fine Lilies are to be seen.

Near here is a mass of the natural jungle—left when the garden was first cleared; it is to be cleared away, or at least cut through in a few days. It is thick, almost impenetrable, and wonderfully rich and varied; Cocoa-nuts and *Areca Catechu* soar above the other trees, but the lower vegetation is one mass of tangled foliage. There is a nice specimen of *Erythrina Crista-galli* in the garden, as well as a very fine specimen of the Nutmeg—*Myristica fragrans*—quite an ornamental tree, some 20 feet high, and clothed to the base with foliage of a rich glossy green.

The office, including the rich herbarium of Penang flora, collected by Mr. Curtis, is on this road, near the entrance; it is a nice, low-built structure, enclosed by a hedge of thick *Panax elegantissima*, the ends of the shoots being bright yellow; the plants are some 4 feet high.

Opposite this is a very handsome low-growing Palm—*Cyrtostachys Renda* is its name. It is somewhat stiffer, but otherwise much like *Areca lutescens*—that is to say, it has many young offshoots. Its beauty to me, however, lies in its brilliant red stems, petioles, and leaf-midribs. I am told it is very fine in Java.

One of the nicest houses—octagonal in shape, is in the centre of the garden; its roof is made of the split stalks of a Palm, and it has open sides. Many Orchids in pots are here in flower. *Calanthe veratrifolia*, *Dendrobium Dearei* (very good), a nice variety of *Cattleya Gaskelliana*, *Phalænopsis grandiflora*, a splendid piece of *Ceologyne asperata*, *Arundina bambuseifolia*, *Vanda insignis*, *Calanthe vestita lutea*, and *C. Regnieriana*, were all in flower, side by side with *Achimenes*, Ferns, Aroids, and small Palms.

Before leaving the garden, a few words about the nursery, as clean and neat as the other parts. There are four long Palm-stem roofed houses, in the first of which are all the latest varieties of *Cannas* growing well in pots. Young *Dracænas* and Palms for sale and planting out are also on one of the low side-beds. *Cattleyas* and *Lælias* are good, better than I have seen them in the East, and *Leptotes* and *Dendrobiums* hang from the roof. The other side is filled with small-foliage *Begonias*, and the centre bed with young Palms in pots, wonderfully smart and neat.

The house parallel to this is the Orchid-house. I was rather surprised at the quality of its contents, but Mr. Curtis considers that before he left the plants looked still better. *Pilumna fragrans*, *Lycaste Skinneri*, *Angræcum sesquipedale*, *Zygopetalum Mackayi* look well, and *Cypripediums* are well represented. *C. insignis*, *C. niveum* (from Kédah, opposite Peang, on the mainland), *Godefroya*, *Lowii*, *Lawrenceanum*, *concolor*, *Rothschildianum* look wonder-

fully well. I also saw some nice pieces of *Ceologyne Dayanum*, and some still larger ones of *asperata*. *Dendrobiums*—all kinds, particularly the *moschatum* section and *Dalhousieanum*—do as well as possible; and East Indian Orchids are fair.

The fernery is very good, and many of the specimens very large. Amongst the largest and best grown, I noticed *Adiantum trapeziforme*, *Farleyense*, *tenerum*, *Seemanni*, *Bansei*, and *Fergusonii*. In another house was a nice row of *Achimenes* and *Gesneras* in pots, both well flowered.

There was no object in staying longer with Mr. Curtis, unless I made an excursion to the mainland; but after talking the matter over with him, we agreed that Java would prove more interesting, and probably more useful from a learner's point of view. I therefore decided to go on to that island. *J. H. Veitch.*

(To be continued.)

ORCHID NOTES AND GLEANINGS.

THE SELF-PROPAGATION OF PHALÆNOPSIS.

At Lord St. Oswald's garden, Nostell Priory, Wakefield, in November, 1891, a strong plant of *Phalænopsis Stuartiana*, growing in a teak cylinder, started two of what appeared to be flower-spikes, one of which produced a small plant on the end, instead of flowers. This plant is now a fine one, with five leaves, the last made measuring $7\frac{1}{2}$ inches in length. It commenced to develop two flower-spikes, one of which was taken off; the other flower-spike, on the parent plant, bore fourteen fine flowers. *Phalænopsis* are well done at Nostell Priory. I shall be pleased to know if any of the readers of the *Gardeners' Chronicle* know of any similar occurrence. *Jno. Edward Sadler, York.* [Not uncommon. Ed.]

THE WEEK'S WORK.

FRUITS UNDER GLASS.

By J. RIDDELL, Gardener, Castle Howard, York.

CUCUMBERS.—The plants should be cropped lightly at this season, and the fruits removed as soon as they are fit for use. Fumigate the pit or house if thrips are troublesome, and keep down red-spider by repeatedly syringing the vines with soapy water; and cut out old growths when that can be done without much loss of bine, and lay in young shoots in their places; and any leaves which may have begun to decay may also be removed to make room for others. Stop the leading shoots on young plants when they are half-way up the trellis, also the lateral growths just beyond the third leaf from the main stem. Maintain a bottom-heat of 80° , and a top-heat minimum of 70° , raising it 5° during the day in dull weather, and from 10° to 15° when bright. Open the ventilators a little about noon, when the weather is favourable. Use the watering-can sparingly, but at the same time the soil should not become dry, which it will readily do now that much fire-heat is necessary. The water used in the Cucumber-house and liquid manure should never be of less warmth than 85° to 90° . Where farmyard or stable drainage cannot be procured, potash or soda, or sulphate of ammonia, may be used instead. Top-dress the border or bed when the roots have permeated the soil, using a mixture of leaf-mould and horse-droppings in the proportion of three of the former to one of the latter.

MELONS AND TOMATOS.—Clear out old Melon beds, thoroughly cleaning the glass, woodwork, trellising, and walls, lime-washing the latter. A temporary staging may then be erected over the beds for the reception of Tomato plants in 6-inch pots. With this object in view, the staging should be raised as near the glass as circumstances will permit, in order that the plants, which should be 12 to 18 inches high, may obtain all possible light. Reduce all superfluous growth of Tomato plants in bearing to within the limits of the trellis, &c., cutting off a portion of each leaf, if needs be, to admit light to the fruits and blossoms, and tie up the growing points. When young shoots are fastened to the stems from which the fruit has been gathered,

the leaves on the stems may be entirely cut off, as well as all suppressed growth, up to the bearing point. Although Tomato blossoms do not set freely in winter, yet by having well-matured wood, and a dry and buoyant atmosphere, fertilisation may still be accomplished. To do this, go over the flowers daily, turning them face downwards, and tapping them with the finger gently, in the manner one would test the soundness of a tumbler with the finger and thumb. Another method is to disengage the anthers and transmit the pollen-grains with a fine-hair brush to the stigma. Superphosphate mixed with an equal amount of bone-meal and a third of kainit may be added to leaf-mould, and applied as a surfacing to the soil when it becomes exhausted. Attend to watering early in the morning, maintaining a temperature from 55° to 60° in the house, and ventilate whenever favourable.

FORESTRY.

By J. B. WEBSTER, Fairview, Stangmore, Dugannon.

SEASONABLE WORK.—In dry weather, remove layers from Lime tree stools and other trees and shrubs usually increased by that method, and plant them in nursery lines on well-prepared ground of a rich open texture. Dress the stools, and in cases where the soil has become exhausted, give a good dressing of leaf-mould, thoroughly decomposed dung, and fine sand, mixing and incorporating the whole together, and lay down the shoots of last summer for the next year's crop. Collect berries of Mountain Ash, Yew, Holly, Hawthorn, and the keys of common Ash and Hornbeam, and as these do not vegetate the first year, they had better be mixed with light sandy soil, and pitted (stratified), where they should be occasionally turned to promote the uniform decomposition of the pulp, skin, &c. Sometimes, however, the berries and Ash-keys are sown at once, and a crop of annuals raised on the surface of the seed-bed, and as these will be removed by next autumn it will allow freedom and space for the tree seedlings the following season. One bushel of fresh gathered berries of good quality should be allowed for 20 lineal yards of a bed 4 feet wide; press the seeds down on the surface, and cover them with about half an inch in depth of fine soil, usually that from the alleys. When gathering Ash-keys, care should be taken to select such as are produced on fine healthy trees, free of canker or blemish of any sort, in order to secure as far as possible a healthy progeny. Gather the acorns of the Oak, and in doing so, select the largest sizes, as they give by far the best plants. These may be sown at once or any time during dry favourable weather in winter up to the month of March. Sow the nuts broadcast on beds 4 feet wide, press them down on the surface, and cover them with fine soil to the depth of $\frac{1}{2}$ -inch. One bushel of acorns should be allowed for 25 lineal yards of a bed the above width. There are several varieties of the common Oak in cultivation, but the most approved tree is *Quercus robur* var. *pedunculata* (Linn.), which produces its acorns on foot-stalks, while the fruit of the inferior kinds are sessile or nearly so. The Turkey Oak, *Q. cerris* (Linnaeus) ripens its seed at the same time as the former, and is propagated in the same way. The seed of the common Beech, *Fagus sylvatica* (L.), should be gathered and selected as they fall to the ground from the tree. These may be sown immediately, or kept in a dry loft during winter, and sown in spring. Sow the "mast" on light sandy soil, formed into beds 4 feet wide; press the mast down on the surface, and cover them with about three-quarters of an inch of fine soil. One bushel of sound seed should be allowed for 40 lineal yards of a bed the above width. The sweet or Spanish Chestnut, *Castanea vesca*, also ripens its seed in autumn, when they may either be sown at once, or kept in a dry place during winter, and sown in spring. The seed may either be sown in drills about 18 inches wide from centre to centre, and the seed about 2 inches apart in the rows, or sow the seed broadcast on beds 4 feet wide, and cover them with 1 inch of fine soil. Before the covering is applied, the seed had better be pressed down on the surface with the back of a spade or roller. One bushel of good seed should be allowed for 30 lineal yards of a 4-foot bed.

THE ORCHID HOUSES.

By H. A. BURBERRY, Orchid Grower, Highbury, Birmingham.

THE MEXICAN-HOUSE.—At this season the temperature of this division may range from 50° to 60° , more or less, according to the state of the weather; but what are of much importance are the atmospheric

conditions within the house, which should be regularly ventilated. The murky weather at this time of the year should be counteracted by just enough artificial warmth as will allow of air being afforded both at the top and the bottom ventilators by night and day, unless the outside air is too cold, or frost is impending. Under these conditions of the house, the flowering period of the short-bulbed *Lælias* is not unduly hastened, and few will open their blooms before the end of December. In very foggy weather, or collections growing in smoky towns, the flowers and foliage are alike injured, and it is not advisable at such times to open any of the ventilators, but rather maintain a gentle artificial warmth and a moist atmosphere; and if any of the plants should become very dry, lightly water them. Plants in a moist condition take less harm than when they are in a dry one [?]. Time permitting, it is good practice to wipe the leaves of Orchids with a sponge and clean water after fog has passed away.

THE COOL-HOUSE.—*Odontoglossum crispum*, *O. Halli*, *O. luteo-purpureum*, *O. triumphans*, and other allied species are sometimes attacked at this season with a kind of mildew, or rusty spot on the under surface of the leaves, which spreads fast until it reach the size of a sixpence or larger. If this mould is allowed to remain on a leaf for a short time it will leave behind it an undesirable and irremovable spot; and its appearance is proof of something being wrong with the atmospheric conditions of the house, and although sponging may remove it, it soon reappears if these conditions remain; and I would recommend for the cool house the same airy conditions as those afforded the Mexican Orchids, although the plants require more water at the roots and more moisture in the air than do those. The temperature should range from 45° to 60°, with warmth in the heating apparatus and ventilation at the top and bottom; increasing the latter in mild, damp weather, as it is then that a somewhat stagnant state of the air in the house favours the attacks of these minute moulds. Plants of *Odontoglossum crispum*, if weakened by any cause, are slow of recovery, and they require to be started anew in smaller pots, using as compost Orchid peat and sphagnum moss, and they should not be allowed to produce flowers until strength is regained; and if more than one break appears, as is often the case with weakly plants, all but the one which should take the lead on the last made pseudo-bulb should be removed.

THE HARDY FRUIT GARDEN.

By H. MARKHAM, Gardener, Mereworth Castle, Maidstone.

PEARS ON WALLS.—The leaves having fallen, pruning should be pushed forward. Old trees usually have too many long fruit-snags, and these should be sawn off to within half an inch (or less) from the main branches, and smoothed over. Care should be taken not to cut off many of the fruit-buds; and all shoots made in the summer should be cut back to a couple of buds from the base, regulating and fastening the main shoots, and leaving space for the wood to increase in thickness. Young trees should have their leaders shortened back to where the next pair of branches is wanted, leaving one bud to make the leader next season, and this should be annually practised till the tree has made its last pair of branches, or if a fan-trained tree till the space is covered. In whatever mode it is intended to train young trees, be it horizontal, fan-shape, or herring-bone, the branches must be sufficiently far apart to allow of a clear space of wall being visible between the foliage, thus allowing the direct rays of the sun to reach the fruit. For small-leaved varieties 9 inches should be left, and for strong growers or large-leaved varieties 12 should be left. Do not shorten back too closely the side shoots, which will form the main branches, but leave these of good length, and they will soon furnish themselves with fine fruit-spurs without much stopping. Cordon Pears planted at 15 inches apart soon refill the walls, or they may be planted wider apart, and from two to three branches trained from each at 1 foot apart. Horizontal cordons look nice objects, and bear well by the sides of paths, if lifted occasionally, and properly treated. They should stand about 20 inches from the ground (figs. pp. 640 and 641). Bushes should be planted where there is space for them in the kitchen garden, and they are preferable to pyramids, the fruits being more exposed, being finer, and higher developed. When pruning pyramids, cut to an eye on the opposite side to which it was cut the previous year, so as to provide symmetry of form; and put to

each tree a stake sufficiently long to fasten the growing leader to. Bushes should be made with an open centre, and the several branches trained outwards by means of stakes, and secured for a few years till the position becomes fixed. Newly-planted Pears should not be pruned till February, and those spring-planted not before a year has elapsed.

PLANTS UNDER GLASS.

By R. MILNER, Gardener, Penrice Castle, Swansea.

HARD WOODED GREENHOUSE PLANTS.—Plants of *Azalea indica* should be frequently examined, and if thrips are discovered on the foliage, wash them well with an insecticide, or fumigate the house lightly on two or three evenings in succession. And as at this season work is not so pressing, all the trained specimens of *Azaleas* should be retied, and put generally in good order. The same will apply to *Ericas* and any of the New Holland plants. As many species have very small hair-like roots, which are easily injured if many sticks are used in shaping them, it will be well to use as few of these as possible, and to make them fine-pointed, and no larger than will serve the purpose. Avoid formal training, but allow as much freedom as the natural habit of growth indicates as being the most suitable. Plants grown for furnishing flowers for cutting need but few sticks, some none at all, the continual cutting the plants endure tending to keep them in form. Air should be admitted freely to the greenhouse containing these plants when the weather permits, but draughtiness should be avoided. At this season mildew sometimes infests these plants, and constant watchfulness is required, and the free use of sulphur-flowery if it be discovered on *Ericas* and other plants.

FORCED PLANTS.—Any plants which will be required to be forced remaining unpotting, should be at once potted, and plunged in coal-ashes either out-of-doors or in a pit or shed, bringing them first into a greenhouse, and then into the forcing pit, as requirements dictate. *Kalmias*, single and double-flowered *Crataegus*, the early-flowering varieties of *Rhododendron hybridum*, *Staphylea colchica*, *Viburnum*, *Spiræa*, *Hotela*, *Astilbe*, *Pyrus*, *Cerasus*, &c., may be placed in a fruit-house which is about to be started, the plants blooming much better if thus brought on gradually.

Roses for early flowering should be pruned forthwith, and placed where the night temperature is kept at about 50°, with a rise by day of 10°, occasionally fumigating them to check aphids. Those which are grown in the early fruit-houses should be cut hard back, and dressed with a mixture of Gishurst Compound, or with one made of sulphur, soft-soap, and clay. The surface soil of the border should be replaced with a stiff, rich, fresh compost, and if water at the roots is needed, afford a thorough soaking with tepid-water.

THE KITCHEN GARDEN.

By G. WYTHES, Gardener, Syon House, Brentford.

VEGETABLES FOR FORCING.—The various materials used for forcing these should be got together in country gardens during the present month and December, whilst plenty of tree leaves are lying about, and the ground is still free from snow. The leaves of Beech or Oak are best, as being more lasting in the hot-bed, and affording good leaf-mould when rotted, which softer leaves do not. In addition to the leaves, stable litter is of use, especially in making hot-beds in the open, or in starting early fermentation in the same, or in the heaps of materials from which these are made. All heaps of leaves and litter should be turned over several times after heating has begun, so as to get the whole evenly heated and sweetened. When the rank steam has passed off, the materials are ready for use, and with due care, the fumes will then, not harm the tenderest leaf.

ASPARAGUS may now be placed in heat, the particulars as to forcing given in previous Calendars being adhered to. Care should be taken to have the bed sufficiently large that it will afford heat to finish the forcing of the shoots, otherwise only the strongest will push up, and the smaller ones decay. Means should also be taken to let the moisture arising from the process of fermentation escape freely; but if the preparation of the material has been properly done, there will not be much moisture, and the heat will be steady. The roots placed in the forcing-house should also get some amount of bottom

warmth to enable the crowns to push forth shoots. When water is necessary, it should be warmed up to 80° or 85°. Asparagus beds forced in the open should now be got in readiness, and if some of these are annually forced, there will be no difficulty in getting the plants in them to start. If leaves form the heating material, a large quantity must be prepared, so that heat may be steady and continuous; and over the sashes or shutters used to cover the bed, some warm litter must be placed. Strong roots of Asparagus cost much money, and most gardeners dig up some old bed or beds for the early forcing in preference to buying. Roots should now be lifted, and in case great numbers are required, the beds should be covered with litter or leaves to keep out the frost. At Syon the permanent beds in the open furnish our supply after February, and tree leaves are employed to afford heat to these.

SEAKALE roots should now be placed in the forcing-house at fortnightly intervals, and as the best flavoured Seakale comes from roots slowly forced, the temperature should not exceed 55° to 60°, the bottom-heat being 5° to 10° warmer.

MINT AND TARRAGON may be placed in warmth, the former in boxes, or on the bed itself, and covered with a little light soil. When above ground the plants must have light, so that boxes are perhaps the more handy, as they can be removed when the plants have sufficiently grown.

RHUBARB.—Place the roots in the forcing-house in numbers sufficient for the requirements, which are often large, at the new year. Choose an early pink-skinned variety, and roots which have grown on a warm border, and which therefore matured their growth at an early part of the autumn. The whole of the roots may be lifted for forcing, placed thickly together under a wall, and well covered with soil or litter.

THE FLOWER GARDEN.

By H. W. WARD, Gardener, Longford Castle, Salisbury.

BEDDING PLANTS.—If the gardener has no better accommodation than that afforded by cold pits for *Pelargoniums* to winter in, care is necessary to save even a third of them, their great enemy in such places being damp. It is advisable that plenty of air be afforded whenever the weather is mild, a mixture of soot and lime deposited among the pots, and between the latter and the brickwork. A covering of Fern, straw mats, or litter is required to put over the glass at night to ward off frost. In mild weather, the frames in which *Pansies*, *Calceolarias*, and *Leucophytons*, are growing, should be well aired by drawing off the lights; and if mildew make its appearance on any plants, at once dust them over while damp with flowers-of-sulphur. Bedding plants being wintered in vineries, peacheries, and other structures which can be heated, must have an abundant ventilation, and they should be kept rather dry at the roots to prevent growth being made before the spring.

HARDY FERNERIES.—In most gardens there are shady and sometimes objectionable nooks, which might be rendered interesting and beautiful by building up a bank with roots and butts of trees, logs, rugged stones, clinkers or burrs from the brick-yard, and planting strong-growing Ferns among them. In placing the materials, observe that most of the blocks of wood or stone recede instead of projecting, so that the plants in interstices may derive full benefit from rain [unless the face of the block is towards the west or south-west, Ed.], and avoid formality of outline and a too level surface. For a soil make use of one of a light open description; fibry peat and loam of the same kind are good to use alone or mixed with the staple. A naturally stiff and heavy soil should be lightened by a large addition of leaf-mould or peat, mixing the whole well together before use. The following species and varieties may be planted, with the certainty that they will afford satisfaction:—*Asplenium* species, *Adiantum nigrum*, *Allosorus crispus*, *Adiantum Trichomanes depauperatum*, *Athyrium filix-femina*, and any of its varieties; *Blechnum spicant*, *B. imbricatum erectum*, *Cystopteris alpina*, *Lastrea cristata*, *L. filix-mas* and its varieties, *L. polydactyla*, *Osmunda regalis*, *Polypodium dryopteris*, *P. hibenum*, *Poly-stichum aculeatum*, *P. angulare*, *P. a. cristatogræcile Jacksonii*, *Scelopendrium vulgare* in variety. In planting, make the soil moderately firm about the plants, and afford water as soon as the planting is finished.

APPOINTMENTS FOR THE ENSUING WEEK.

MEETINGS.

- WEDNESDAY, NOV. 30 { Annual Dinner of the National
Chrysanthemum Society, at An-
derton's Hotel, Fleet Street,
London.
- FRIDAY, DEC. 2—Duodec Horticultural Association.

SALES.

- MONDAY, NOV. 28 { Dutch Bulbs at Protheroe & Morris'
Rooms.
Plants sale at Protheroe & Morris'
Rooms.
Dutch Bulbs, Lilies, Plants, and
Shrubs at Stevens' Rooms.
- TUESDAY, NOV. 29 { Bulbs at Protheroe & Morris'
Rooms.
The Maplewell collection of Mas-
devallias at Protheroe & Morris'
Rooms.
Dutch Bulbs, Lilies, Plants and
Shrubs at Stevens' Rooms.
- WEDNESDAY, NOV. 30 { Great Fruit Tree Sale at Perry Hill,
Cliffe, by order of Mr. W. Horne,
by Protheroe & Morris.
Bulbs at Protheroe & Morris' Rooms.
Lilium auratum and other Lilies at
Protheroe & Morris' Rooms.
Sale of Lease, Stock, and Furniture
at the Nurseries, Staines Road,
Hounslow, by Protheroe & Morris.
Dutch Bulbs, Lilies, Plants and
Shrubs at Stevens' Rooms.
- THURSDAY, DEC. 1 { Dutch Bulbs, at Protheroe &
Morris' Rooms.
Plants, at Protheroe & Morris'
Rooms.
Dutch Bulbs, Lilies, Plants, and
Shrubs, at Stevens' Rooms.
- FRIDAY, DEC. 2 { Clearance sale of Orchids at Pro-
theroe & Morris' Rooms.
Dutch Bulbs at Protheroe & Morris'
Rooms.
- SATURDAY, DEC. 3 { Dutch Bulbs at Protheroe & Morris'
Rooms.
Dutch Bulbs, Lilies, Plants and
Shrubs, at Stevens' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSU-
ING WEEK, DEDUCED FROM THE OBSERVATIONS
OF FORTY-THREE YEARS, AT CHISWICK.—41° 3.

The following extract from our excellent contemporary, *Garden and Forest*, is so much in harmony with what for many years past we have been endeavouring to advocate, that we gladly transfer it to our columns. Gardening will be no less of a delight and a recreation if it be pursued in a scientific spirit than it is now, while practically its value is certain to be greatly enhanced by the information which the accurate study of nature affords. No surer foundation for substantial improvement in the arts of agriculture and horticulture (says our contemporary) can be laid than a broader and deeper knowledge of the sciences on which they rest; and, certainly the science of plant-life is chief among these:—

"Some time ago Professor BAILEY made a plea for a broader botany. We quoted largely from the article at the time of its publication, and will only repeat that the fact complained of was the restriction of botanical science to the study of wild plants. This was natural in earlier days, when there was little attempt to apply science to cultivation, but since the theory of evolution has come to be accepted, a new purpose has been given to the study of all natural objects, and cultivated plants especially have gained a fascinating interest because they furnish such conspicuous examples of variation and heredity. The great mass of material which the multiplied species of cultivated plants afford can be made to illustrate the accumulative effect of modified environment and selection under the influence of human care as wild plants cannot possibly do. They can show within a brief period as much progression in definite lines as their wild prototypes could show in ages. This makes the garden one of the best places in which evolution can be studied. But the point which it is proposed here to insist upon is, that more and more it should be the endeavour of those interested in

agriculture and horticulture to bring into practical use the facts and laws which science discloses, and make them actually helpful in the cultivation of plants. The study of botany as pure science, the investigation of the laws of plant physiology and variation under different conditions, can have abundant application in improving the quality and changing the character of economic plants as well as in developing new and better methods of cultivation. This means that not only should increased attention be given to the study of fungi and bacteria and other special branches of the science, but that more attention should be given to investigations and experiments, to show how all the general truths of the science can be applied to the improvement of agricultural and horticultural practice.

The increased interest and attention which the study of botany has attracted, and which is seen in the numerous State and national gatherings of men of science where a growing number of subjects in this field are discussed in a broad and practical way by able men and women, is largely due to the work in the agricultural colleges and in the national Department of Agriculture. The work of practical botanists can be seen in numerous journals and transactions of these societies, in many books and bulletins. The place which the science of botany ought to fill in a well-conducted institution for the advance of agriculture is coming to be understood and appreciated, and Dr. BEAL is right in saying that no agricultural college can rank among the best where a professor of botany is required to teach any other subjects, and a simple enumeration of a few of the essentials of a botanical department according to his view will show how many-sided and comprehensive its equipment should be. It should have enthusiastic workers in the field, good collectors, and persons well skilled in preparing plants for the herbarium. In agricultural colleges particular attention should be given to Grasses and forage-plants, trees, shrubs, and weeds. The herbarium should include specimens of cultivated plants, both those that are grown in orchards and vegetable-gardens as well as those that are grown for ornament. The laboratory should be supplied with so many compound microscopes that only one person should have access to the same instrument during any term; it should have microtomes, reagents in abundance, with all needed apparatus for experiments in plant physiology and for photography. It should have duplicated volumes of needed reference-books all the time in the class-room, besides a generous library. It will not be complete without a museum of plant-products and numerous green-houses for giving different varieties of temperature, light, and moisture. Beyond question, it should have a botanic garden and arboretum, where growing plants could be studied, each in the soil and exposure best adapted to it. Of course, it should have a liberal, uniformly increasing and permanent endowment, not only because a properly equipped and conducted botanic garden in itself involves an immense outlay of money, but because the botanic department of a progressive university, if it is under efficient management, will develop in all directions just in proportion to the means at its disposal."

TAXODIUM MUCRONATUM.*—We are indebted to Mr. RASHLEIGH for the opportunity of figuring very probably the oldest living inhabitant of our globe, and one of the noblest and most famous trees in the world. It is a near ally, indeed probably only a variety, of the deciduous Cypress of Florida, *Taxodium distichum*, which we have often figured in these columns from Sion and elsewhere. The tree we now illustrate grows, according to a letter of an engineer correspondent, "eighteen miles south-east of the city of Oaxaca, capital of the State of that name, and just outside a church. When

I visited the tree for the first time, I was with a man who had measured it twenty-five years previously, and had the record in his diary of that date, showing the circumference to be 136 feet 6 inches. The circumference when I first visited the tree in 1886 was 139 feet, showing an increase of 2 feet 6 inches in twenty-five years. The trunk has the appearance of being an amalgamation of several trees, the height (about 120 feet) being so out of proportion to the diameter; and other trees of the same species at Chapultepec are much taller." We subjoin some further particulars taken from the *Pinetum Britannicum*:—The Mexican representative of the deciduous Cypress is distinguished from the type, by the less size, fresher green, and more slender and tapering character of its twigs and leaves—whence it has received the garden name of *T. pinnatum*, by the size of its flower, the male flower being three or four times the size of that of *Taxodium distichum*, and by its more tender constitution [and, we may add, the absence of the singular outgrowths from the root so characteristic of the deciduous Cypress.] The tree itself reaches a greater size and age than any specimens of the type in N. America. . . . It is found in the immediate neighbourhood of the city of Mexico, and in other parts of that district, and in Oaxaca, where the largest tree known grows near Santa Maria del Tulé (the tree now figured). It was at first supposed that, notwithstanding the difference of the climate in which it lives, and some differences in appearance, it was the same as the *Taxodium distichum*. HUMNOLDT saw the Oaxaca tree, and sought for a distinction without success. SEEMANN says he does not know any Conifer which is so closely confined to the vicinity of running streams. To say that some of the present trees were as old as the Incas is nothing. It would probably be strictly true to say that they were, to outward appearance, as old in their time as they are now. It is not by hundreds of years that their age must be counted, but by thousands. We have already mentioned that the tree at Santa Maria del Tulé, in Oaxaca, is no less than 200 feet in circumference. How many years must it have taken to build up such a trunk by the slow process of the deposit of an annual ring? There is nothing exceptionally rapid in the growth of these trees—we should call them slow-growing. If we take one line, $\frac{1}{16}$ inch of growth, to be the average breadth of annual deposit, that would give nearly 9000 years as the age. But ZUCCARINI in his estimate thinks it safer to assume one sixth of a line as the average, which would make it six times as old. The gigantic trunk of the tree in Oaxaca, near Santa Maria del Tule, was first mentioned by ENTER, who found its circumference to be 117 10 French feet. DE CANDOLLE doubted this, and thought there must be some mistake in the measurement, such as including in it the dilated base; but ZUCCARINI removed his doubts, and satisfied him that the measurement was taken above the dilated base, for if that had been included, the girth would have been no less than 200 feet.

The late Prof. ASA GRAY, alluding to these trees, says:—"By the same computation" [calculating the ages of old trees by comparing their size and rate of growth with those of young plants of the same species] "the Cypress at Attisco would be 3480 years old; or 2390 years if we allow it the maximum rate of growth for the first century. So, likewise, the great Cypress at Santa Maria del Tulé would be 5124 years of age, or 4024 years with the aforesaid deduction. The latter accords perfectly with DE CANDOLLE'S minimum estimate; and it is the lowest age that, in the present state of our knowledge, can possibly be assigned to this prodigious tree, upon the supposition that its trunk is really single."

"After making every allowance for errors of observation and too sanguine inference, and assuming, in the more extraordinary cases, those estimates which give minimum results, we must still regard some of these trees, not only as the oldest inhabitants of the globe, but as more ancient than any human monument—as exhibiting a living

* *Taxodium mucronatum*, TENORE, PARLATORE, in *DE C. Prod.*, xvi., 441; MASTERS, in *Journ. Roy. Hort. Soc.*, 1892, xiv., 248. Syn., *T. Montezumae*, DECAISNE; MURRAY, in *Pinet. Brit.*, ii., 215, t. 36. *T. distichum*, *Garden and Forest*, March 26, 1890, f. 28.

FIG 10).—THE MEXICAN DICIDUOUS CYPRESS (*TAXODIUM MUCRONATUM*) AT TULÉ. (SEE P. 64.)

antiquity, compared with which the mouldering relics of the earliest Egyptian civilisation, the pyramids themselves, are but structures of yesterday." (*Scientific Papers of Asa Gray, selected by C. S. Sargent* (1889), vol. ii., p. 124.)

It is clear that the statements as to size and age vary too much for any reliance to be placed on them. Even our correspondent does not mention at what height from the ground his measurements were taken. A small wedge-shaped mass could be cut out of the trunk on either side without injury, and these sections would afford better evidence than any we yet have as to the rate of growth and age of the trees, especially if compared with sections of young trees growing under like circumstances.

The next largest trees are two, both near the city of Mexico; one in the gardens of Chapultepec, and the other the tree under which Cortez passed the night—known as the *Noche triste*—after the defeat and expulsion of the Spaniards from Mexico. Dr. PARRY (*Geological Reports*, i., 43), says, "The appearance of the Cypress (*Taxodium*), Sabino of the Mexicans, makes quite a striking change in the physiognomy of the country (the lower Rio del Norte, or Rio Grande)." This water and rock-loving tree often appears right in the middle of the swiftest currents of the river, where, having taken hold of some rocks on the bottom, it boldly defies the force and action of the water.

We are not familiar with the Mexican Cypress in cultivation, as it is rarely seen in this country, owing to its tender constitution. We believe, however, that there is a tree at Penrhyn Castle, near the Menai Strait.

PROPOSED EARLIER OPENING OF KEW GARDENS.—Mr. FRANCIS GEORGE HEATH, who has recently taken a leading part in a movement for the earlier opening of Kew Gardens, had an interview with the First Commissioner of Works on the subject. Replying to objections which had previously been urged by Mr. THISELTON-DYER, Mr. HEATH contended that no harm whatever would accrue to the plants by opening the gardens in the morning instead of at noon, but was merely a question of different arrangements for carrying out the work in the Gardens. Moreover, about a thousand persons had already the right of early admission. With respect to the argument of Mr. DYER that students and botanists would be inconvenienced, Mr. DYER had himself expressed the belief that the privilege would be used only by a few persons comparatively, and the inconvenience must therefore be necessarily small. Mr. SHAW LEFEBVRE promised to give full consideration to the arguments which had been urged by Mr. HEATH, but pointed out that the making of fresh arrangements touching the work in Kew Gardens was likely to entail extra expenditure—it had been calculated about £600—and as that was a matter which affected another Government department, he must postpone a definite reply till this fresh aspect of the question had been considered.

POTATO EXPERIMENTS IN IRELAND.—A very interesting series of Potato experiments has, says the *Times*, been carried out this year by the Royal Dublin Society, the agricultural superintendent of which body has just sent an early proof of the report. It deals with the yields of marketable and sound tubers of various varieties, together with their cooking qualities, and, as these are based on no fewer than fifty-four experiments in as many parts of Ireland, the results should be very valuable. It is pointed out in the summary of the results that an interesting feature is the striking uniformity obtained in the two years' trials. This order is as shown below:—

Weight of Produce.—In weight of produce the Farmer comes first in both years by about 15 cwt. per acre. In 1891 the Champion stood second, but in 1892 the Bruce beat it by a fraction. The Colonel ranks lowest in both years. It will be noticed that the average produce of the Bruce and the Colonel is almost precisely the same this year as in 1891—a somewhat peculiar result from so many trials. The Bruce is the only variety that shows an increase over 1891 in gross yield of sound Potatoes.

This increase, however, is entirely in "small" Potatoes. It will be observed that the Antrim (which was not tried in 1891) stands fourth—before the Colonel—in weight of produce.

Disease.—Reckoned by their power of resisting disease, the four varieties tried in the two years stand as follows:—First, the Bruce; second, the Colonel; third, the Farmer; and last, the Champion. In all the four varieties there is rather more disease this year than last. The greatest increase is in the Champion, a fact which affords another indication of the declining vitality of this much-valued Potato. It will be observed that in ten trials in the province of Munster, the percentage of diseased Potatoes in the Champion was no less than 12·34. It is interesting to note that the Antrim, the newest Potato of the five tried this year, comes out with the lowest percentage of disease.

Quality when Cooked.—The uniformity in the results for the two years are just as striking in regard to quality as to weight of produce and percentage of disease. The Champion still maintains a long lead in respect of quality. The Bruce, Colonel, and Farmer follow in the same order in both years. The Antrim just beats the Bruce for the second place.

THE FOG NUISANCE.—Invariably at this season, when dreary November days are drawing us farther into the heart of the winter, our attention is drawn to the common winter scourge of London, and indeed of all the large manufacturing towns. How to prevent it? In what measure may its baneful effects be minimised? These and other questions are continually presenting themselves for solution. During the last few seasons, at any rate, a more or less organised attempt has been made in many centres to analyse this dreaded mixture, in order to more effectually determine its origin, and to furnish information that may lead to more useful results hereafter. Its deadly effects upon plants and animals have been carefully recorded. Suggestions in the hope of abating its ravages have not been wanting, but at present no advance has been actually made, and we are the victims of its terrible poisoning in a measure which increases year by year. Those who may be interested in the question as it applies to plants—and who is not?—would do well to go to Messrs. TOOPE & Co.'s establishment at Stepney Square, London, E., and inspect a process which has been patented by Mr. TOOPE for preventing injury by fog to plants in houses, and known as "Toope's Fog Annihilator." The method, as far as we understand it from Mr. TOOPE, is as follows:—The house is built as airtight as practicable, and several inlets are made close to the bottom, on the inner side of which is placed one of Mr. TOOPE's patent air-purifying boxes, through which the whole of the admitted air is compelled to pass. In the centre of the roof are several patent exhaust pipes, which afford an outlet for the warm air, and this is, of course, followed by a supply of exterior air, which has been purified in the process above described. In this way a continual circulation of fresh air is effected strong enough to carry a flame or smoke from a taper, unmistakably towards one of the exhaust-pipes. Mr. TOOPE finds no difficulty in admitting air in any quantity as the weather may render necessary, nor is the principle less adaptable to large houses than to smaller ones. When we visited the place a few days ago, there were many plants whose sensitiveness to fog is well known, such as *Euphorbia splendens*, *Poinsettias*, *Ruellias*, seedling Cucumbers, Tomatoes, &c.; and these, although fog had been only too dense, were apparently uninjured. Unfortunately, the district is so inimical—even at its best—to plant life, and the glass in the house so black, that but a poor light is obtained even when fog is absent; but for these circumstances, the blanched appearance of some *Calanthe Veitchii* would have suggested the evil the house was designed to obviate. This attempt to grapple with one of the worst pests a gardener has to fight deserves encouragement, and we shall be glad to hear that it is successful in providing him with an effectual weapon.

LINNEAN SOCIETY.—An evening meeting will be held on December 1, 1892, at 8 P.M., when the following papers will be read:—1. "Notes on *Ecodoma cephalotes*, and the *Fungi* it cultivates," by J. H. HART, F.L.S. 2. "On a small Collection of Crinoids from the Sahni Bank, N. Australia," by Prof. F. JEFFREY BELL. 3. "Descriptions of Twenty-six new species of Land Shells from Borneo," by E. A. SMITH.

— At the ordinary meeting, held on Thursday, November 17, Professor STEWART, President, in the chair, the President having announced a proposal by the Council to present a congratulatory address to the Rev. LEONARD BLOMFIELD (formerly JENYNS), M.A., F.L.S., on the occasion of the seventieth anniversary of his election as a Fellow of the Society, and in recognition of his continuous and useful labours as a zoologist, it was moved by Sir WM. FLOWER, and seconded by Dr. St. GEORGE MIVART, that the address be signed and forwarded as proposed. This was carried unanimously. In moving the resolution, Sir WM. FLOWER took occasion to sketch the scientific career of Mr. BLOMFIELD, who is now in his ninety-third year, and to recapitulate the works of which he is the author under his earlier and better-known name of JENYNS. The address, which was beautifully illuminated on vellum, was then signed by those present. Mr. BUXTON SMILLITOE exhibited a cluster of the fruit of *Pyrus sorbus*. A paper was then read by the Rev. Professor HENSLOW, "On a Theoretical Origin of Endogens through an aquatic habit, based on the structure of the vegetative organs." The lecture, which was very fluently delivered, was profusely illustrated, and drew forth some interesting criticism from Professor BOULGER, Messrs. HENRY GROVES, H. GRESS, and PATRICK GEDDES, to which Professor HENSLOW replied.

BOURNEMOUTH AND DISTRICT GARDENERS' ASSOCIATION.—Professor JOHN WRIGHTSON, of Downton College, delivered a lecture on the "Chemistry of Soils" at the fortnightly meeting of the above on Wednesday, November 16, the lecture being given under the auspices of the Technical Education Committee of the Hants County Council; admission was free to the general public. A good number of the latter, and a strong muster of the members of the association made up a large and attentive audience. Professor WRIGHTSON made use of clear and concise language, and thus rendered a difficult and complex subject easily understood by those possessing little or no knowledge of chemistry.

SOCIETY OF ARCHITECTS.—The second ordinary meeting of the Society of Architects for the session 1892-93 will be held at St. James's Hall on the 29th, when a paper will be read by Mr. G. W. USILL, R.M.Inst. C.E., entitled "Levelling and Contouring as applied to Architecture and Landscape Gardening."

INSTRUCTION FOR PRACTICAL FORESTERS' AND GARDENERS.—The scheme which has been elaborated by Professor BAYLEY BALFOUR, for giving a course of free instruction to practical foresters and gardeners in the Royal Botanic Gardens, Edinburgh, was auspiciously started on the 17th inst., says the *Scotsman*, in the presence of a number of gentlemen interested in arboriculture and horticulture, and of a full complement of pupils. There were in all sixty-seven applications from young practical gardeners and foresters for the benefit of the scheme, and of these forty-four were accepted, and have received tickets for the course. A proportion of these young men have been engaged at a weekly wage as gardeners at the Royal Botanic Gardens; the others are employed in the various nurseries in the city. The visitors included Mr. M. DUNN, Dalkeith, vice-president, and Mr. W. J. MOFFAT, secretary of the Royal Scottish Arboricultural Society; Mr. W. WELSH, president, and Mr. R. LAIRD, secretary of the Scottish Horticultural Association; Mr. LINDSAY, curator, Botanic Gardens; Mr. JAMES GRIEVE, Pilrig Park; Mr. JAMES MOFFAT, and others.

Professor BAYLEY BALFOUR, after giving a cordial welcome to the students, said it was not intended to teach them in the class-rooms to be practical foresters or gardeners. That must be learnt elsewhere. But if they wanted to know the secrets of forestry and of horticulture, they ought to have a sound knowledge of the scientific basis upon which they worked. It was meant, therefore, to give them some insight into the sciences that underlay their work. This winter they should have three courses, one on chemistry and one on physics, and, in addition to that, they should have a course on mensuration and land measuring. This last course would be begun this winter; but they would do more at it when the long evenings came. They would then go out into the garden, where surveying instruments would be provided. They would be taught to use these instruments, to survey land, and to draw out plans. After these subjects had been gone through, they should then proceed to deal with botany, which treated of the actual plants they would handle; of geology, which treated of the soils in which the plants grew; they should also have a course of meteorology, giving them the application of physics to the study of climate; and a course on entomology, which would work into the course of botany, and would show them how insects affected forest and garden plants in health and disease. After that they should have lectures on forestry and horticulture, treated by experts from a practical point of view, and be hoped it would be possible to arrange for excursions to neighbouring estates and gardens. August and September would be holiday months. Professor BAYLEY BALFOUR then stated that it had been arranged that this winter Dr. LEONARD DOBBIN should lecture on Tuesdays on Chemistry; Dr. Wm. PEDDIE on Physics on Thursdays; and Mr. A. D. RICHARDSON on Mensuration and Land Surveying on Tuesdays.

TROPICAL AGRICULTURE.—Enquiries frequently reach us as to authentic works on this subject. Some of our English treatises are merely compilations executed by authors without any special knowledge of the subject; others are incomplete. To those conversant with the French language, we may commend the *Manuel Pratique des Pays Chauds*, by the late Dr. SAGOT, and edited by M. E. RAOUL. We are familiar with the excellent articles on the subject communicated to the French Horticultural Press. The work, which we shall notice at greater length hereafter, is published by AUGUSTIN CHALLAMEL, 5, Rue Jacob, Paris; and may be had of Messrs. WILLIAMS & NORGATE.

PRIMULA POISSON is likely to prove a useful garden plant, as it flowers in early winter. There is a batch of it in flower in the Cape-house at Kew, some of the plants bearing scapes 2 feet high, with several whorls of open flowers. The species is not unlike *P. japonica* in habit, but it has thicker and less crimped leaves, and the flowers, although quite as large, differs in form as well as in colour, being soft mauve, with a conspicuous yellow eye. Plants in the open ground have grown freely, but they are not likely to flower. Evidently this species thrives best when treated as a cool greenhouse plant. It was introduced from China by the Abbé Delavay several years ago, and flowered for the first time at Kew last year.

SALE OF RARE BOTANICAL BOOKS.—The extensive and valuable library of Count LOUIS APPONYI, of Nagy Apponyi, Hungary, which has lately been sold by auction by Messrs. SOTHEBY, WILKINSON, & HODGE, of Wellington Street, Strand, London, included an extensive series of botanical books. This library was formed by the present proprietor's great grandfather, Count ANTOINE APPONYI, an accomplished scholar who died at Vienna in 1817. The items, with the prices at which they were sold, of especial interest to our readers, include the following:—N. T. Host, *Icones et Descriptiones Graminum Austriacorum*, 4 vols., 400 finely coloured plates, Vienna, 1801-9, £8 10s. (published at £45 18s. unbound); the following

works by N. J. Jacquin: *Observationes Botanice*, 100 plates, 1764-71, £3; *Hortus Botanicus Vindobonensis*, 3 vols., 300 plates, £5 15s. (only 162 copies printed, another copy was sold in the same rooms some time ago for 14 guineas); *Flora Austriaca*, 5 vols., 500 plates, 1773-78, £9 15s. (the last copy sold at auction realised £31 10s.); *Icones Plantarum Rariorum*, 3 vols., 648 beautifully coloured plates, 1781-93, £7 15s. (one of the most magnificent works on botany ever published, and of which a previous copy realised £17 5s.); *Oxalis Monographia*, 81 plates, quarto, 1794, £1 1s.; *Plantarum Rariorum Horti Cæsarei Schönbrunnensis Descriptiones et Icones*, 4 vols., 500 finely coloured plates, 1797-1804, £3 10s. (the cost price of this splendid work was 280 thalers = £42, and two previous copies were sold at auction for 550 francs, and 16 guineas respectively), and *Fragmenta Botanica*, 138 plates, 1809, £10 15s. (the publication price of this scarce and splendid book was £30); all these works of Jacquin were published in Vienna, and are, with the one exception indicated, in folio size. J. Kraft, *Pomona Austriaca*, 2 vols., 200 finely coloured plates, Vienna, 1792-96, £1 14s.; P. Miller, *Abbildungen der Schönsten, Nützlichsten und Seltensten Pflanzen in seinem Gärtnerlexicon*, 2 vols., 301 coloured plates, Nürnberg, 1768-82, £1 1s.; J. J. Plenck, *Icones Plantarum Medicinalium*, 8 vols., 758 coloured plates, atlas folio, Vienna, 1788-1812, £3 5s. (the cost price of this valuable work unbound was £32 5s.); P. J. Redouté, *Les Liliacées, décrites par M. De Candolle, F. de La Roche, et A. Raffeneau-Delile*, 8 vols., 480 beautifully coloured plates, royal folio, Paris, 1802-16, £10 5s. (the publication price of this work was 3200 francs, unbound); and F. R. de Tussac, *Flore des Antilles*, four vols., plates, imperial folio, Paris, 1808-27, £9 (a magnificent work, published at 1050 francs, unbound).

THE BOISSIER HERBARIUM.—The publication of a *Bulletin de l'Herbier Boissier* is announced. The new journal will be edited by M. Eug. AUBRAN, the Keeper of the Herbarium at Chambésy, near Geneva, and will comprise monographs, original articles, and notes on systematic botany. It will form annually a thick octavo volume with illustrations. The publication price is 12 francs.

HARTLAND'S WHITE TRUMPET DAFFODILS.—We are sorry to notice by the Cork papers, that through means of a fire, originating in the out-offices at Ard Cairn, Cork, and spreading to the bulb-house, on the evening of the 17th, half of this rare collection of Trumpet White Daffodils has been entirely lost, some very valuable and scarce. One lot of Colleen Bawn, probably the most beautiful of all (600 bulbs), just removed from the warehouse for planting, are a great loss. It will be difficult for any collector, or for Mr. HARTLAND, to replace this valuable collection; searching in Spain and Portugal up to the present time being fruitless.

TAKING COALS TO NEWCASTLE.—A familiar saying this, which has a double meaning—in the present connection, the taking of goods to the place where the raw material is produced, and selling at a good profit. In the colony of Natal, any kind of fruit can be grown in profusion—Bananas and the Sugar-cane near the coast, Avocado Pears, Mandarin Oranges, enormous Peaches, and on to Strawberries and other small fruits in the neighbourhood of the highlands, where there are frosts and snow and rest for the plants; and yet, with all the profusion of Nature—despite it all—jams and preserved fruits are imported from England and Scotland, and from foreign countries! We have purposely included the Sugar-cane for obvious reasons. It is a thing hard to believe, but it is none the less a fact, and we might suggest to the "powers that be away out there," that there is a very fitting opportunity to hand for the development of a great industry. A more striking case of taking coal to the pit-mouth is afforded by the milk supply of Natal—the source of which is Switzerland! There is glorious pastorage in this favoured South African land—the grass grows most luxuriantly, and not being eaten off, has to be burnt yearly, so that the few browsing herds may get

a bite of the young fresh grass. There is no native milk in the colony; thousands of miles away, in the beautiful Swiss valleys, browse the cattle whose udders supply what could so easily be furnished by cattle grown themselves in equally beautifully African localities. The "moral" attached to this little narrative need not be reproduced here. Perhaps, in this instance, capital is required to start the business of milk-production; it looks very like as if it would be a paying one—and here we may leave the matter.

VEGETABLE PRODUCTS OF CALABRIA.—In a recently issued Foreign Office report on the trade and navigation of Naples, it is stated that the produce of Oranges and Lemons last year was very satisfactory both to producers and merchants, having reached the total amount of 57,000 tons, of the value of £285,000. It seems that the fruits have risen in price of late, owing principally to the great facilities granted by the railway companies, by which means a great quantity is exported to the north of Italy where the fruit is largely consumed. It seems that no direct exportation of Oranges and Lemons was effected from Calabria during 1891 save a small quantity of salted Citrons for Russia. "Although," Vice-Consul KERRICH says, "it is well to note here that of the quantity of fruit exported from Messina to foreign countries this district (Ileggio, Calabria) contributed for the most part, especially in the Oranges, of which that province does not produce a great quantity. In fact, the returns for 1891 show an exportation of 97,000 boxes of fruit from this district to the port of Messina, wherein are not comprised the Mandarins. Also important is the production of dry fruit in this district, particularly of Chestnuts and Figs, the latter being considered as good as those produced at Smyrna. The quantity exported in 1891 was 3000 tons, of which 1000 tons went direct to Malta. With reference to Olive-oil, which of late years has become so much adulterated, Vice-Consul KERRICH says:—"The oils of this province are well known in England, and English houses that do business in this article would gain much by purchasing directly from these places the refined oils, and those for table use. This could be attained by sending in due time their orders here, instead of giving their commissions for branded oils to intermediate markets, where these oils are sold for 'Provenza' oils." The production of timber in the district is said to be one of considerable importance, as the restoration into woodland is greatly favoured by the law of the kingdom. Large quantities of timber are annually exported from the district to all the rest of Italy; but the exportation of the same to foreign countries, which some time ago was of some importance, has diminished, owing to the present prevailing system of using iron hoops instead of those of green Chestnut wood formerly used, and now only employed in the manufacture of casks and boxes for Oranges and Lemons.

COUNTY COUNCIL LECTURES.—Mr. R. RUFFETT, late gardener at Panshanger Park, and Mr. D. PHILLIPS, gardener at Ware Vicarage, have been selected to lecture practically on horticulture by the Hertfordshire Technical Instruction Association.

CHISWICK GARDENS.—The Chrysanthemums in the great vinery are still very interesting, filled as the building is from end to end with plants grown much more naturally than is usually the case. Disbudding has, it is true, been practised to a certain extent, but the plants are many of them regular bushes carrying from twenty to thirty blossoms, instead of the regulation two or three at the most.

CHRYSANTHEMUM SHOWS.—With the years the number of Chrysanthemum shows continues to increase beyond our power of finding space for full reports of them, and the following brief mention must suffice.

BEAUMARIS held a Chrysanthemum show on November 15 at the Town Hall. A fair number of exhibits were staged.

THE DISS HORTICULTURAL SOCIETY held a show in the Corn Hall on Tuesday, November 15. The

entries were less numerous than in the previous year, but the quality of the exhibits was good, and on the whole the show was most creditable. The chief exhibitors were Mr. Notcutt, Ipswich; Mr. Burrell, Bury St. Edmunds; Rev. F. Page Roberts, Scole; Mr. A. W. Bolton, Mr. Frere, Mr. A. Taylor, and Mr. S. L. Cocks.

WEST HARTLEPOOL held its show in the Armoury of that town, which was in every way worthy of the local Chrysanthemum society, which has done much to encourage the cultivation of the flower in the Hartlepoons. Mr. A. Taylor, of Broomhill, carried off the Silver Cup given by Alderman Pyman, J.P., in addition to the 1st prize for twenty-four blooms. The other principal prize-winners were Messrs. S. A. Taylor, Boynton, T. Smith, J. Hall, T. Pattison, Combes, and D. Reed.

YORK.—The annual show of Chrysanthemums, held under the auspices of the Ancient Society of York Florists, was opened on Wednesday, November 16, in the Fine Art Exhibition building, and the display was on a magnificent scale, and despite some falling off in the quality of the bloom, it was as good as any of its predecessors. The 1st prize, including a Silver Cup, given by the Lord Mayor of York, fell to the donor, though there was very little to choose between his lordship's group and those of Mr. J. T. Hingston, York, and Dr. Bedford Pierce, York, who were respectively 2nd and 3rd. There were also shown several groups not exceeding 80 square feet arranged for effect, Mrs. Gutch, York, taking 1st prize; Miss Steward and Mr. S. Hardcastle, both of York, took the 2nd and 3rd prizes. In the other open classes of plants, Mr. T. Smith, Beverley; Mr. W. Dickenson, York; Mr. G. Whitehead, Deighton Grove; Mr. T. Lambert, York; Mr. G. T. Theakstone, York; Mr. H. Leatham, York; Mr. W. B. Richardson, York; Mr. J. Gould, Starbeck; Sir James R. Walker, Bart., York; Mr. H. Bushell, York; and Mr. J. Key, York, were the most successful exhibitors. In the cut flower section, Sir James R. Walker was very successful; and the other exhibits which pleased the judges most were those of Alderman Harding, Darlington; Mr. H. G. Southwell, Grimby; Mr. T. Smith, Messrs. G. Longster & Sons, Malton; Mr. C. H. Simpson, Pontefract; Mr. G. Whitehead, Mr. H. Stourton, Holme Hall, York; Miss Steward, Mr. T. Lambert, the Earl of Zetland, Mr. J. Sinclair, York; Mr. C. Dowson, Middlesbrough; Mr. T. Battensby, Blyden-on-Tyne; Mr. J. Gould, and the Rev. G. Yeats, York. Several classes for gentlemen's gardeners or amateurs residing within a radius of 5 miles of York contained some excellent exhibits.

RUGBY.—This show was held on Tuesday, November 16, and following day, in the Town Hall, and was a great advance on that of last year. For a group, P. A. Muntz, Esq. (gr., Mr. H. Blakeway), won the 1st prize, and was closely followed by the Rev. F. D. Morice (gr., Mr. Morton). In the open class for cut flowers, eighteen incurved and eighteen Japanese, distinct, the competition among the eight exhibitors was great, and the 1st prize was awarded to the Earl of Dudley (gr., Mr. Coombes), Himley Hall; the Earl of Denbigh (gr., Mr. Harman), was 2nd; and Mr. Marriott (gr., Mr. Finch), Coventry, 3rd; two other exhibits in this class, those of Mr. W. H. Divers and Mr. Underwood, were Highly Commended. In the class for twelve incurved, S. Symington, Esq. (gr., Mr. Dunkley), was 1st; and for twelve Japanese Mr. Harman was 1st. The competition was good in the local classes, and good blooms were staged. A fine bank of Palms, Ferns, &c., kindly sent from the gardens of P. A. Muntz, Esq., M.P., made a welcome addition to the show. Some very nice baskets of Chrysanthemums were shown, and a class specially for ladies brought several very nice exhibits of sprays, wall bouquets, hats, &c. Miss Cumming and other ladies very kindly arranged a stall of fruit and flowers for the Gardeners' Orphan Fund, which was most tastefully decorated and deserved an extra prize.

HANMERSMITH HORTICULTURAL SOCIETY.—The ninth annual exhibition took place on the 22nd

inst., and was not up to the usual average, the Chrysanthemums being poor in the gardeners' classes. The committee should offer good prizes, and make the competition more open than is at present the case, then they might expect a really creditable display. In the amateurs' division the premier prize for a group arranged for effect was secured with a good arrangement from Mr. J. Woodhouse, St. Peter's Grove. The leading position for Chinese Primulas, well-flowered plants, was taken by Mr. T. Nelson, St. Peter's Road.

BIRMINGHAM GARDENERS' ASSOCIATION.—One of the most interesting meetings of late took place recently, when some new Chrysanthemum blooms were sent by Mr. OWEN, of Maidenhead, and objects of interest by others. Two well-grown dwarf plants of the new variety, W. H. Lincoln, a grand golden-yellow Japanese, were only about 18 inches high, with good blooms on each. They were struck from cuttings in May last, the fine new Japanese variety, Colonel B. Smith, was shown. Mr. OWEN also showed his new incurved variety, The Bride, and others of promise. Messrs. POPE & SONS, nurserymen, contributed two promising new Chinese Primulas. The Society has an extensive valuable library, which is much used by the members, who can take the books home.

THE WOLVERHAMPTON HORTICULTURAL SOCIETY.—Our Birmingham correspondent informs us that the profit arising from the great horticultural and musical fête last July was £310; and the committee have voted the sum of £74 towards supplying music in the public park next summer, and the sum of £1000 from the Society's funds has been voted for the erection of a large conservatory in the centre of the park; a sub-committee has been appointed to carry out this object, and obtain plans and estimates. Other sums of money during the four years of the Society's existence have been devoted to the improvement of the Public Park, and this without touching the reserve fund, and there is a sum of £200 in hand as well. The Wolverhampton Public Park is one of the finest in the kingdom, and is kept in admirable order; and anyone with a love for rare herbaceous and other plants can spend an hour or two with great pleasure and profit with Mr. THOMAS, the Curator, in an examination of his herbaceous garden especially.

HOME CORRESPONDENCE.

THE GARDENERS' BENEVOLENT INSTITUTION.—As one of the stewards of the dinner of this Society last week, I wrote to many of my horticultural and gardening friends about the country, and received several additional annual subscriptions and donations; but amongst the letters of regret from some of my friends that they could not subscribe, I

received one from Scotland which surprised me, as it contained an expression of opinion which I felt sure was founded on a very erroneous idea. My Scotch friend stated in his letter:—"The Gardeners' Benevolent Institution is useful only to English gardeners, and on that account we have never contributed to its funds; wishing you however every success." Thinking it better to get this officially contradicted, I wrote to the Secretary, and his reply is as follows:—"Your friend is greatly in error, and cannot know of the Institution or of its work. As a matter of fact, our operations extend all over the United Kingdom, and, as you will see from the enclosed list of pensioners, we have persons benefiting from our funds in England, Scotland, Ireland, and Wales. In Scotland we have three pensioners receiving £56 per annum, whilst the sum we receive from the whole of Scotland amounts to considerably less than that; so that we are actually paying away to Scotland more than we receive from it—a circumstance which, I think you will agree with me, ought not to obtain. At the present time we have an applicant seventy-six years of age, who was born and bred in Scotland, and lived half his life as a gardener there. I am persuaded that with this explanation your Scotch friend will see his way to help us with an annual subscription.—Yours faithfully (signed) GEORGE J. INGRAM, Sec.—A. Watkins, Esq." I hope this letter will be the means of disabusing the minds of any of our Scotch, Irish or Welsh horticultural friends who may have the same impressions, and lead to a largely increased annual subscription list for this very valuable Institution. *A. Watkins*.

CYCLAMEN SEED.—It is sometimes thought that only "new" seed will germinate. This, however, is an erroneous idea, the seed retaining its full germinating power if kept quite dry. Experiments with seed seven or more years saved have been made by the St. George's Nursery Company, Hanwell, with the result that every seed sown came up. *B.*

ROOT-WORK.—Your correspondent, Mr. G. F. Wilson, deserves the thanks of all persons interested in small gardens, for calling attention to the value of root-work. Where roots can be obtained, or even rough pieces of unworked timber, they may be made to serve a very useful purpose in a variety of ways. In many places, from the nature and position of the surroundings, it is impossible to induce even the hardiest of shrubs to thrive, they will gradually dwindle away; but, if a root-work be formed with taste, it may be planted in such a manner as to be both useful and beautiful. At this time of the year especially, one of the most beautiful objects is a root or rough piece of timber covered with Ivy, and I would point out that when once planted they stand for a very long period at a minimum of attention. For town planting, no doubt the green Ivies are best, but in a clear atmosphere, the variegated kinds produce an effect when planted, in such positions as is not soon forgotten. *W. Fisher, Burton-on-Trent*.

AUTUMN-SOWN PEAS.—Mr. Divers' remarks on p. 586 of the *Gardeners' Chronicle*, respecting the sowing of Peas in the autumn may be very good, but I fail to see what is the use of sowing Peas outside in the autumn, when they can be had quite as early by sowing selected varieties in the spring, either under glass, or on a warm early outside border. The amount of labour and care required to secure a dish of early Peas by autumn-sowing hardly pays for the trouble by the results, leaving out of the reckoning the waste of seed by having to sow it thicker in the rows than usual, in order to secure a full plant in the row. Failure of a crop is too often the result of sowing Peas in the autumn. I have found Chelsea Gem and Veitch's Selected if sown and forwarded in heat, or soaked twenty-four hours in water previous to sowing in the rows outside, and duly protected from cold winds, come into use quite as early, and produce far better results than Peas sown in the autumn. Laxton's Standard I am not acquainted with. I do not think that gardeners who have heavy soils to deal with will agree with Mr. Divers' remarks respecting the qualities of Criterion, or that Veitch's Perfection is not now required. Criterion on heavy land, if obtained true, is, I consider, one of the best second early Peas in cultivation. The flavour, when grown on heavy land, is excellent, the Peas, when boiled, of a beautiful green colour, and the plant bears pods fit for use for a long period. Veitch's Perfection, being of dwarf growth, and the Peas of excellent flavour, is certainly a valuable sort to grow, on account of its being easy of protection in the event of early

autumn frost, and I think a great many gardeners who have a daily supply of Peas to keep up, will think twice before they come to the conclusion that Perfection is not now required, especially in places where gardeners are requested to grow only wrinkled varieties. Success cannot be too highly recommended as a late Pea for heavy land. I grew it during the seasons of 1890 and 1891, and ordered it this, having proved its merits. I recommended it to be tried by my friends who had not done so. The fact of Success obtaining three marks at Chiswick, also the sample, as shown by Mr. Wythes at the Drill Hall a short time ago, and which was awarded a First-class Certificate, only go to uphold the good opinion already formed of Success as a great acquisition to our late Peas, both as to flavour and profit. *John Chinnery.*

EDINBURGH BOTANIC GARDEN.—Just now the dullest mind could not help learning a lesson of unselfishness on witnessing the lovely rock garden at the Botanic Garden; for so many of the inhabitants are trying to look bright and cheerful in what Shakespeare calls "barren winter, with its nipping cold." The winds in Edinburgh have been piercingly cold, and foggy and rainy days have been frequent, yet these little flowers grow upward to their ideal, despite untoward circumstances. I will give a list of these courageous plants:—

Veronica maritima	Colechicum purpureum striatum
" spicata	"
" parvifolia	Arabis procurrans
" rupestris	Geranium aconitifolium
Aster grandifolius	Polygonum vacciniifolium
" longifolius	Polygala chamaebuxus purpurata
Alyssum pyrenaicum	Senecio pulcher
" saxatile	Gaultheria carnea
Helleborus seedling	Aubrietia græca
" niger	Dianthus deltoides
Hypericum Borsieri	Potentilla formosa
" pulcher	Stenactis speciosa
Helianthemum amabile	Acæna microphylla
" altifolium	Linaria alpina
Lithospermum prostratum	
Crocus, Asia Minor	

Of these, two are British plants, viz., Veronica maritima and Dianthus deltoides. The citizens of Edinburgh owe a debt of gratitude to the late Mr. James McNab for this almost perfect rock garden which he initiated. It was a pleasant task, also, revisiting the glass-houses. The floor of the Palm-house is being lowered, so that the top of the tubs will be level with the ground. Noticeable plants in flower in the greenhouse were Monocheton ensiforme, Cineraria cruciata, Witsenia corymbosa, and Bauera rubioides. *Vagabond.*

APPLES.—An admirable illustration of the need there is for wider knowledge concerning Apples in the rural districts was evidenced at the recent meeting of the Fruit Committee of the Royal Horticultural Society. A very estimable but certainly poor clergyman, mentioned to me in one of the south-eastern parishes of Surrey recently, that he had a considerable surplus of Apples he would like to find a market for. I advised him to send samples to the Drill Hall for naming, if possible, and then some sort of probable value in the market might also be furnished. Out of the several sorts sent, only two or three were recognisable as inferior samples of named varieties, and others were evidently natural seedling sorts. Judging by the sample sent, the top price obtained for such fruit when got to market would not exceed 2s. per bushel. No wonder it is found needful to advise the complete revolutionising of much of what is called fruit culture in the rural districts. *A. D.*

NEW CULINARY PEAS.—In August last, when at the great annual floral *fête* at Shrewsbury, I took the opportunity of going on to Wem, about a dozen miles further, to see Mr. Eckford's new dwarf and other Peas of which I had heard so much, and observed at various exhibitions. Starting with Ne Plus Ultra as one of the parents, with a view to obtaining dwarf-growing earlier kinds, possessing the flavour of that fine variety, with its blunt-ended pods, successive crossings and selections have resulted in some very superior varieties, which well deserve notice. Another point that has been regarded at Wem as a prominent one to be attained is, a dark green-coloured pod of good size, and well filled with dark green seeds. A variety named Superabundant has already been sent out, but as yet is little known. It grows about 2½ feet high, is an abundant cropper, with good-sized, well-filled pods, and rich-flavoured, and of a good green colour. Censor is from 2½ to 3 feet high, with robust haulm, a good cropper and first-class, and received three marks at the Royal Horticultural Society's

gardens. Colossus grows 4 feet high, with extra large pods, which are well filled. This will be a valued exhibition Pea also, as the pods are extra large. Ambassador will also be found a fine exhibition Pea, growing 6 feet high, with large, handsome, well-filled pods, and their flavour all that is wanted. Critic grows 4 feet high, a very fine Pea indeed—large, well-filled pods of good colour, delicious flavour, and another very first-rate exhibition variety. Copious has a slightly-curved pod, a great cropper, and a fine variety, growing about 2½ feet high. A variety named Wem, of medium height, has broad, large, well-filled pods, blunt at the end, and of Ne Plus Ultra type in flavour. Eckford's Gem, 3½ to 4 feet high, is a grand variety; pods of medium length, broad, blunt-ended, and well filled. This is an early Ne Plus Ultra, and will be popular. Of older sorts raised at Wem, Shropshire Hero, 2½ to 3 feet, a very first-rate Pea and excellent cropper—is a market gardener's and everybody's Pea, with well-filled, good-sized pods, and of good flavour. Eckford's Fame and Heroine are also very fine varieties. A visit to Wem teaches a lesson as to sowing and

FIG. 101.—HYACINTH GROWING IN A BALL OF MOSS, ETC.

growing. Mr. Eckford grows probably 2 acres of Peas each year of his new sorts and seedlings, for the purpose of keeping his stocks quite true, by chasing out any "rogues," i.e., plants which are not of the true character. A great deal of his personal attention is devoted to this object, and when the character of the variety is fixed, hanks of seed are sent away to be grown by the acre in various parts of the country, and personal visits are made by Mr. Eckford during the podding season to ensure any further weeding out of "rogues," should there be any. At home the Peas are planted rather than sown very thinly in the rows, so as to ensure strong robust branching plants. In fact, bushy plants with from eight to fourteen branches, were abundant, the plants from 15 to 18 inches apart, and a good boiling of Peas could be gathered from one plant. Plenty of bush-plants of Superabundant and other kinds were to be seen loaded with pods, some with a stick or two to keep them upright, whilst others took their chance, for it is no joke to attempt sticking an acre or two of Peas. It however proves one thing, that thick sowings do not bring out the true habit of the variety in growth and productiveness, and when new varieties are issued at high prices and in small quantities, economy in sowing is requisite. At Wem the ground is made tolerably solid for sowing, and

the soil trodden after sowing; this soil then is a good loam, and suits Peas and Potatoes well, and, in fact, almost everything else. *D.*

ÆSCULUS.—On p. 586, Mr. J. D. Webster describes a Horse-Chestnut at Skene House, which, he writes, as occupying, with its trailing lower limbs, the space of 90 by 70 feet. In all vegetable life, as we see it in England, there is no single tree more impressive than a wide-spreading Horse-Chestnut like the one Mr. Webster describes. Equally large Beeches growing in the same way, as at Trentham, do not possess the same imposing effect. This was first forced on my mind by a Horse-Chestnut which uplifts a dense knoll (mass) of verdure on the lawn in front of Euston Rectory, near Thetford, and, like its congener at Skene, hides, under its lowest branches, a big circuit of ground. At every season of the year the tree is beautiful, especially in spring, when it covers itself all over with the pink-white of an orchard. As Mr. Webster points out, the way the buds open to the call of spring, and their impervious covering against "nipping winter," are very interesting to study. On the other side of the road to the rectory is the translucent little river Thet, flowing gently past the wall of the Duke of Grafton's kitchen garden, where Mr. Low, the author of an excellent book on *Table Decoration*, presides. As Euston Park is essentially a sporting estate, and the house and stables together form an enormous mass of building, there is not much opportunity for landscape gardening. The flat nature of the lawn and the character of the house are, however, adapted for large flower gardens. There are two of these, which in naturalness of design and in the blending of the colours, would hold their own with any of the famous flower gardens. *Vagabond.*

NEW ALPINES.—Under this head on page 614, are one or two names which I read with surprise, as the plants are well-known, and have long been in general cultivation in English gardens. One of these is *Campanula lactiflora* (M. Bieb. Syn. C. celtidifolia, E. Boissier). This was cultivated by Loddiges at Hackney in 1815, and figured in the *Botanical Magazine* of 1818, tab. 1973. It had been figured a year or two earlier in *Edwards's Botanical Register*, tab. 241. I have known it as a garden plant for about twenty years; and though effective as a back-row border flower, I consider it rather a coarse plant, as it grows more than 8 feet high here, making densely branching masses of flowering stalks. The colour ranges from nearly white to dark blue, and it produces self-sown seedlings so freely that visitors to my garden can always carry away as many as they please. It has very often been mentioned in the gardening journals, some writers venturing to assert that the two names mentioned above belong to different plants, though all the shades of colour may be raised from the seed of one. *Chrysanthemum* (*Pyrethrum*) *cinerariæ-folium* is another plant well-known here in cultivation. I received it, when first I collected plants, as *P. Willemettii*, a name I never could verify, but it has long been in the Kew herbaraceous garden under its right name. Mr. W. Thompson, of Ipswich, offers seed of it as "The insect-powder plant," though I have never seen any record of its cultivation for this purpose for which the flowers of *P. roseum* are generally said to be used. *C. Wolley Dod, Edge Hall, Malpas.*

HORTICULTURAL INSTRUCTION.—The latter part of your criticism on my suggested need for horticultural text-books (p. 621) is exactly what I do mean. All who have asked for such books are either young gardeners, who want to obtain wider knowledge on horticulture than they can gather in an ordinary garden, or persons of the amateur-gardener persuasion, who, having gardens, also want to obtain wider information than they possess. There is no suggestion that books should be employed for cramming only those who enquire for them, who really want fully to understand gardening, and are grateful for information derived from what source it can be obtained. What person is there interested in Vine culture who does not rise from a perusal of Mr. Barron's book on the Vine instructed; that is a book, for instance, were it cheaper, one would like to be able to commend to young gardeners and amateurs. *A. D.*

HYACINTHS IN MOSS.

The accompanying cut (fig. 101) represents a Hyacinth growing in a ball of moss. In this case a Beet-root had been inserted in the lower part of the

ball, with the head downwards, the leaves of which are to be seen curling up round the ball. The moss merely requires to be kept damp, and the system is a pleasing change to growing them in water.

LELIO-CATTLEYA EXONIENSIS.

In Lord Rothschild's gardens at Tring Park, is to be seen a six-flowered spike in one of the best forms of this favourite hybrid. It is one of Messrs. Veitch's earliest hybrids, and few, if any, of the later acquisitions have surpassed it in beauty.

SOCIETIES.

ROYAL HORTICULTURAL. Scientific Committee.

NOVEMBER 15.—Present: R. McLachlan, Esq., F.R.S., in the chair; and Mr. Morris, Dr. Miller, Dr. Russell, Rev. W. Wilks, Professor Green, Professor Oliver, Dr. Bonavia, Mr. Wilson, Professor Church, and Rev. G. Henslow, Hon. Sec.

Injury to Plants by Fog.—In accordance with the proposal of the Scientific Committee made at the last meeting, the Council of the Royal Horticultural Society has passed the following resolutions in reference to the investigation of the nature and injuries to plants by fog:—

1. That the Royal Horticultural Society, through its Scientific Committee, having devoted considerable attention to the effects of London fogs on cultivated plants, is of opinion that the increasing prevalence of these fogs is causing great inconvenience and loss to horticultural interests within the metropolitan area; and as these interests are associated with one of the largest and most important enterprises of plant cultivation under glass carried on in any part of the world, it is a matter of the greatest importance that the circumstances connected with the chemical compositions of these fogs, their origin and extent, the amount of sulphurous acid contained in them, as well as the diminution of light caused by them, should be carefully and exhaustively investigated.

2. This Society, being also of opinion that London fogs are detrimental to public health, and calculated to render London an undesirable place of residence for many months of the year, as they interfere with trade and public business, and cause serious loss to the community generally, invites the co-operation and support of kindred societies and of all organisations interested in the subject, in a representation to the London County Council to institute an inquiry into the causes and circumstances of these fogs, with the view of reducing their injurious character, or if possible removing altogether the causes which have led up to them.

On the suggestion of the Scientific Committee, the Council agreed to set apart one of the propagating pits at the Chiswick Gardens, for the purpose of carrying out experiments during the current winter to mitigate the effects of fogs on cultivated plants. It was also agreed to inform the Chiswick Board of this arrangement, and to request the Superintendent to give what assistance he could in carrying out the suggestions of the officers placed in charge of the experiments.

Dr. Russell stated that he thought it would be of great importance with regard to the fog question if a comparative and simultaneous series of determinations of the amount of light could be carried out at once, both in the City and outside London, in order to thus obtain a more exact idea of the enormous loss of light experienced in the City during the winter months. With the object of familiarising himself with the method adopted by the Manchester Committee, he was experimenting with their process.

Garden Labels.—Mr. Morris remarked on the difficulty of finding any material suitable for labels. They had tried a great variety at Kew, but the best in being most durable was a strip of lead with the name stamped upon it. He exhibited a sample from the garden of A. Cushman, Esq., Pains Hill Park, Cobham, dated 1774, on which the name "White Magdalen Peach" appeared to be as sharply indented as at first. It is said, however, that the lead of the present day, in consequence of its being purer through desilverisation, would probably not last so long.

Lilium auratum.—Mr. Wilson mentioned that a

single bulb of this plant in his garden had thrown up eight flowering stems. When dug up it was found to have developed seven good well-formed and large bulbs. It grew in a good vegetable and loamy soil.

Wellingtonia with Fungi.—Specimens of fallen leaves and shoots of this tree were sent from the gardens, Orton Hall, Peterborough, with numerous small white agarics growing upon them. They proved to be *Mycena hyemalis*, Osbeck.

Alder Leaf Perforated.—Mr. Wilks showed a dead leaf of Alder very symmetrically perforated with two series of holes. It was most probably due to a sudden chill on the expansion of the buds in spring. A similar occurrence is not infrequent in Horse Chestnut and other leaves from such a cause.

REIGATE AND DISTRICT CHRYSANTHEMUM.

NOVEMBER 11.—The fourth exhibition of this society was held in the Public Hall, Reigate, on the above date. This particular society receives, and well deserves, the support of the residents of the district. The chief end of a Chrysanthemum society is usually supposed to consist in the providing of prizes for growers of Chrysanthemums; but this particular society, though not neglecting the object for which it was established, does much more. Last year the amount distributed in prize money was £38 14s, and the managers gave out of the proceeds of the year thirty guineas to the Asylum at St. Anne's, Red Hill, ten guineas to the Gardeners' Royal Benevolent Institution, and ten pounds to the Gardeners' Orphan Fund. The exhibition was exceedingly good, although somewhat cramped, owing to the small size of the room. It was necessary to arrange some of the exhibits in an underground room, owing to want of space in the large hall.

The groups of plants were very good indeed, the quality of the blooms on them being of great merit. For one occupying a space of 50 square feet, Mr. J. Brown, gr. to Mrs. Waterlow, Great Doods, was 1st, the quality of the plants excellent, the foliage being green and healthy, and the plants of dwarf habit. The Japanese varieties were principally used. Mr. W. Bailey, gr. to W. L. Barclay, Esq., The Briars, Reigate, was a good 2nd, three other groups being put in competition. Mr. Brown also obtained the 1st prize for four admirably-grown specimens, without any training other than was required to hold the shoots in position.

For four standard-trained plants, Mr. W. Hamilton, gr. to Mrs. Grice, Beechwoods, well deserved the 1st prize awarded to him, for these were admirably-grown plants.

The specimen plants were not generally good, but Mr. W. Peters, gr. to W. Finch, Esq., Duncroft, deserves notice for the excellent group of plants with which he won the 1st prize for a group occupying 30 feet. The quality of the flowers was excellent.

Cut blooms were numerous, and of good quality. The competition for the 1st place in the class for thirty distinct varieties of Japanese being very keen between Mr. C. Ritchings, gr. to Dr. Frankland, The Yews, Reigate Hill, and Mr. Salter, gr. to T. B. Haywood, Esq., Woodhatch, the former winning by only one point.

Mr. Geo. Ormiston, gr. to J. Colman, Esq., Gattin Park, Reigate, won 1st prize with twenty-four Japanese blooms, a nice even lot; and for twelve, Mr. E. Tickner, gr. to J. Watney, Esq., Shermanbury, Reigate, easily won 1st with capital blooms. He had a fine bloom of John Dyer, reddish-brown on a gold ground; W. H. Lincoln was also very fine.

Mr. C. Ritchings was awarded 1st prize for six capital blooms of Avalanche, and also for six remarkably fine blooms of Golden Empress, to one of which the 1st prize was awarded, as being the best bloom in the exhibition.

Mr. Salter won 1st prize for twelve reflexed blooms, twelve large-flowered Anemones, and for twelve bunches of Pompon varieties, the quality throughout being very good.

The incurved section was not quite up to the usual quality, as a rule, and this might have been observed in the groups, which contained a score of Japanese varieties for one of the incurved section. Mr. Ritchings won the 1st prize for twenty-four incurved blooms, with an even lot of flowers.

Good collections of table plants and Chinese Primulas were exhibited—better, in fact, than one usually sees at local exhibitions.

Table decorations also made a good feature, and it is a pity that there was not a better competition for the handsome prizes offered by the President of the Society, J. Colman, Esq., of Gattin.

The Certificates of the National Chrysanthemum Society were awarded to Mr. Brown and Mr. Peters for their groups of plants.

HITCHIN.

NOVEMBER 11.—Even at this date, the lateness of the season rendered the competition less than usual in the classes for incurved varieties. The show however, taken as a whole, was a good one.

In the cut bloom classes, Mr. E. Beckett, gr. to H. H. Gibbs, Esq., Aldenham, Elstree, was the most successful exhibitor, the fact of this well-known exhibitor being in good form giving some idea of the show. Mr. Beckett was 1st for twenty-four Japanese distinct, with very even, fresh and fine blooms. Mr. Beckett was likewise 1st for eighteen incurved finished blooms, and he was 1st for six blooms, one var., incurved, having grand examples of Princess of Wales. Mr. Kipling, gr. to Mrs. Osgood, Knebworth, was 2nd for twenty-four Japanese, coming well up to Mr. Beckett, except in size. Mr. Hartless, gr. to T. F. Harrison, Esq., Kungawalden, Bury, being in the same position with incurved varieties.

The competition for six of any kind except white (Japanese vars.) was very keen, Mr. E. Cotton, gr. to A. W. Lines, Esq., Hitchin, being 1st, with splendid blooms of Sunflower; Mr. Kipling 2nd, with very superior examples of Boule d'Or; the 3rd prize going to Mr. W. G. P. Clark, Assistant-Sec., and an amateur, who, with some fine blooms, succeeded in beating several gardeners.

For six blooms, any white variety of Japanese, Mr. Kipling was 1st, with splendid blooms of Avalanche, pure in colour, and very fresh; Mr. Hartless 2nd, with the same variety; and Mr. Beckett 3rd, with fine blooms of Florence Percy.

The amateurs showed strongly as usual, Mr. W. P. G. Clark being the most successful for eighteen vars. Japanese and incurved equal. He was 1st with five flowers, taking the National Chrysanthemum Society's Silver Medal and a volume of *Amateur Gardening* for the best bloom in the section with Sunflower. Another successful exhibitor in these classes was Mr. G. Saunders.

The competition for groups was not very keen; two very good ones were staged, these came from Mr. Orsman, gr. to S. Lucas, Esq., and Mr. Upchurch, gr. to F. Lucas, Esq., who were respectively 1st and 2nd.

Mr. Springham, gr. to J. H. Tuke, Esq., was easily 1st, for six trained specimens, showing plants large enough for any purpose, bearing a profuse number of finely-developed flowers, and not too formally trained.

Two other good classes were those respectively for twelve Japanese and twelve incurved blooms, in which Mr. E. Cotton took both 1st prizes.

Mr. Beckett was awarded the N.C.S. Certificate for the best stand of cut blooms, and Mr. Springham received the same recognition for the best six plants.

In the ladies' classes for table decorations, there was a strong competition (unusually so), Miss Alice M. Barker, Benslow, being 1st, with a simple arrangement of smallish blooms of Sunflower, with green and bronze foliage in addition.

ECCLES AND PATRICROFT, PENDLETON, CHRYSANTHEMUM.

NOVEMBER 11, 12.—The sixth annual exhibition of this flourishing Society was held in the new Drill Hall, Patricroft, on the above date. The progress of the Society has been a remarkable one, and it has met with much encouragement in the district. The shows were formerly held in the Town Hall, but the insufficient space at command in that building caused them to be removed to the more spacious Drill Hall. The show was opened by W. Lockett Agnew, Esq., J.P., who, in a well-chosen speech, spoke of the good the Society was doing in the district in fostering a love of gardening. Considering the character of the present season, the quality of the cut flowers shown was good, although, as else-

where, a falling off was observable amongst the incurved class. The entries were numerous, and the competition very keen. Some few good groups were observed, consisting wholly of Chrysanthemums, or of mixed stove and greenhouse flowering plants. Table plants were also well shown. The successful exhibitor for these and the group of miscellaneous was Mr. Ekin, gr. to Mrs. Agnew, Eccles; and the 1st for the Chrysanthemum group was Mr. Lovell. Mr. Watts, of Wavertree, Liverpool, was 1st for the leading collection of cut flowers. Bouquets and a variety of floral devices were well shown.

Mr. Upjohn, gr., Worsley, contributed, not for competition, a good group of foliage and flowering plants, and a basketful of Grapes. The Drill Hall was decorated with specimens from gentlemen living in the locality. The affair passed off in a most satisfactory manner, which, in a great measure, was due to the admirable arrangements of the secretary and the committee.

WIMBLEDON CHRYSANTHEMUM SHOW.

NOVEMBER 15, 16.—It was unaniously admitted that this was the best exhibition yet held by the society. Groups were an especial feature. The arrangements being well carried out by the Hon. Secretaries.

For a group of Chrysanthemums, arranged in a semi-circle, 10 feet in diameter, the 1st prize, a Silver Cup value 5 guineas, was awarded to Mr. R. Bradford, gr. to W. Hope Hall, Esq.; 2nd, Messrs. J. & A. Bateman, Willow Nursery, Merton. Group, 8½ feet in diameter, 1st, Mr. C. Day, gr. to H. C. Ford, Esq., St. Brindans. Specimen plants were successfully shown by Mr. J. Portbury, gr. to W. N. Froy, Esq., Ripon House, Putney Heath, and Mr. J. Bentley, gr. to Lady Gabriel, Edgecomb Hall, Wimbledon Park.

Much interest centred in the competition for the Challenge Cup, value 15 guineas, offered by W. B. Faulkner, Esq., with £5 added to the 1st prize by the society, for forty-eight blooms, twenty-four incurved, and twenty-four Japanese. It was won, after a close run, by Mr. W. Mease, gr. to A. Tate, Esq., Downside, Leatherhead, with a grand lot of flowers. As this exhibitor has now won it three times in succession, the Cup becomes his property. Mr. Mease took 1st honours in several other classes. 2nd, Mr. G. Carpenter, gr. to Major Coles Brown, Broad Oaks, Byfleet.

Twelve incurved, 1st, with a fine lot, Dr. Walker, Liogfield Road, Wimbledon, another exhibitor who had a repetition of successes in other classes; 2nd, W. B. Faulkner, Esq., Fairholm. Other winning competitors in the cut bloom classes were Mr. A. Skeggs, gr. to Mrs. Doon, Copse Hill; Mr. J. Portbury, gr. to W. N. Froy, Esq.; E. Lindfield, Esq., East Finchley, &c. The prizes for the premier blooms, Japanese Vivand Morel, and incurved Lord Alcester, were won by Mr. Mease.

Group of miscellaneous plants, arranged for effect in a space 40 feet super.—1st, Mr. J. Law, gr. to R. S. Dean, Esq., The Priory; 2nd, Mr. R. Bradford, gr. to W. Hope Hall, Esq.

Group, 30 feet super.—1st, Mr. T. Chandler, gr. to the Rev. Canon Haygarth, The Vicarage.

Flowering and foliage plants, arranged in baskets 3 feet in diameter, made an effective display. 1st, Mr. F. Ware, gr. to L. Walters, Esq.; 2nd, Mr. J. Law, gr. to R. S. Dean, Esq.

Primulas (double and single) were well-shown by Mr. A. Newell, gr. to Sir E. Saunders, Fair Lawn; Mr. W. Mease, Messrs. J. & A. Bateman, and Mr. T. Chandler.

Table plants made an effective background to the Chrysanthemum blooms, the most successful exhibitors being Mr. T. McGregor, gr. to the Dowager Lady Hay, North House, Putney Hill, who had well-coloured Crotons; and Mr. W. Mease.

Fruits.—Hardy fruit was represented by good collections of Apples and Pears, and the leading competitors in the Grape classes were Mr. A. Alderman, gr. to C. Czarnikow, Esq., Ethingham Hill House, Dorking; Mr. C. Griffin, Combe Bank, Kingston; Mr. J. Seldeu, gr. to Sir Guy Campbell, Bart, Coombe Cottage; Mr. A. Methven, gr. to W. Keiller, Esq., &c.

Vegetables made an interesting exhibit. Mr. G. Cole, gr. to W. H. Peat, Esq., South Hayes; and Mr. Thornton, gr. to T. E. Crocker, Esq., showing well in this department.

The non-competitive exhibits were numerous and noteworthy. Amongst the principal may be mentioned a magnificent bank of flowering and foliage plants tastefully disposed, from Messrs. D. S.

Thomson & Sons, The Nurseries, Wimbledon; group of foliage plants, &c., from Messrs. E. D. Shuttleworth & Co., Peckham Rye; and effective groups of Chrysanthemums from Mr. D. Sheahan, Hartfield Road Nursery, Mr. J. Nash, Belvedere Nursery, and Messrs. J. and A. Bateman, Willow Nursery, Merton.

Dr. Walker, Wimbledon, exhibited samples of the Walker Chrysanthemum cup and tube, a useful invention, which recently received a Certificate of Merit at the Crystal Palace.

KENT COUNTY SHOW OF FARM FRUIT.

NOVEMBER 15, 16.—In the Corn Exchange, Maidstone, this Society held its third show on the above dates, and judging by the improvement discernible both in quality and the number of the exhibits, the show as a whole should be regarded as the successful outcome of an effort to encourage high-class fruit growing.

There were twelve classes, all of which were well filled; in the four quarter-sieves of dessert Apples class there were thirteen entries of very good fruit. For the best collection, not to exceed twenty-four dishes, open to landowners (or their gardeners), farmers, market gardeners, and nurserymen, Mr. Woodward, Barham Court, took the lead with very fine fruits; and he was closely followed by Mr. Thomas, Rodmersham, who was, by the way, very strong in Pears.

For nine dishes of Apples and three of Pears, farm-grown, Mrs. Fremlin Teston, was 1st; Mr. Thomas, 2nd; and H. L. C. Brassy, Esq., Preston Hall, was 3rd.

For one sieve of dessert Apples, Mr. F. Smith, Loddington, was an easy 1st, showing fine bright-looking Cox's Orange Pippin; being followed by Mr. Thomas and Mr. W. M. Fearon, Mereworth.

In kitchen varieties, four quarter-sieves, Mr. Chambers, Mereworth, was 1st, and Mr. Smith 2nd.

In the class of four quarter-sieves of kitchen Apples, Mr. A. Killick was 1st; 2nd and 3rd falling to Mr. H. Lenev, Farleigh, and Mr. Fearon, Mereworth. Two quarter-sieves, 1st, Mr. G. Warde, West Farleigh; 2nd, Mr. Goodwin.

Pears were well shown by H. L. C. Brassy, Esq.; Mr. Sharman, Mereworth; and Major Best.

Dried fruits, jams, bottled fruits, &c., were well represented.

LIVERPOOL.

NOVEMBER 15, 16.—Visitors to this centre of Chrysanthemum culture expect to see a fine autumn exhibition, but it is doubtful if one so good has been seen there in any previous year. There was a great increase in the number of entries, and the quality was quite up to the average; indeed, so fine were the Japanese cut blooms, that it would be difficult to have them finer.

Fruit made a good display, and the hall was rendered bright by the masses of gay colours presented by the stove and greenhouse plants, groups of Chrysanthemums, &c.

Cut blooms.—Handsome prizes were offered in the several classes, which evoked great competition.

For forty-eight, half to be incurved, and half Japanese varieties, in not less than thirty-six varieties, there were no fewer than eight entries for the 1st prize of £10. Mr. D. Forbes, gr. to A. Holt, Esq., Crofton, Aigburth, was easily 1st, with heavy fresh blooms; Mr. G. Burden, gr. to G. Cockburn, Esq., Liogdale Lodge, Birkenhead, was 2nd; and Mr. Jellicoe, gr. to F. H. Gossgge, Esq., Camp Hill, Woolton, was 3rd.

Messrs. R. P. Ker & Sons, seedsmen, Liverpool, offered a challenge cup, value ten guineas, along with a cash prize of ten guineas, for twelve incurved, twelve Japanese, and twelve reflexed, for which there were six entries. Mr. Jellicoe was 1st by a narrow margin; and Mr. Heaney, gr. to H. G. Schintz, Mossley Hill, was a close 2nd. These two stands possessed much merit.

There were fifteen entries for Japanese varieties in the class for eighteen, and here Mr. Jellicoe won again with an even lot of massive flowers; Mr. Foster, gr. to J. Brancker, Esq., Green Bank, Wavertree, being a close 2nd.

Mr. J. Williams, gr. to C. J. Proctor, Esq., Boscobel, Birkenhead, was 1st, for twelve blooms, with a grand stand; and Mr. Jellicoe was 2nd. There were fourteen entries.

Another class for twelve was well filled. Incurved varieties generally were very fine, Mr. S. Healey, gr. to Colonel Wilson, Hillside, Allerton,

taking 1st for eighteen; and Mr. Forbes was 2nd; but in the class for twelve he was 1st, and Mr. S. Elsworthy, gr. to R. Gladstone, Esq., Court Hey, was 2nd. Mr. Howard, gr. to A. S. Mather, Esq., Beechwood, Woolton, was 1st in a second class for twelve distinct, with a meritorious lot of flowers. Mr. J. Broome, gr. to T. Harrison, Esq., Belle Vale Hall, Gateacre, took the 1st prize with substantial blooms of the best varieties; Mr. Wilson, gr. to H. Cunningham, Esq., Gorse Cop, Gateacre, was 2nd. Messrs. Foster and Jellicoe secured the leading honours for six reflexed varieties in the order of their names.

Pompons showed improvement on previous years: Mr. Sires, gr. to G. Smith, Esq., M.P., Carlton, Princes Park, was 1st for twelve.

The groups of Chrysanthemum were fairly good, 1st, Mr. Winkworth, gr. to R. Brocklebank, Esq., Childwall Hall; 2nd, Mr. E. Bennett, gr. to J. E. Gordon, Esq., Dadlow House, Wavertree, who was also 1st for the best six untrained specimens.

Mr. J. Harrison, gr. to Mr. W. G. Bateson, Elm-hurst, Aigburth, was 1st for six Pompons, shown in good style.

Mr. Jellicoe contributed stove and greenhouse plants in fine condition. Orchids formed a distinct feature of the show. Mr. Bounds, gr. to A. L. Jones, Esq., Oaklands, Aigburth, was 1st, with some well-flowered *Oncidium crispum*, *O. Forbesii*, and *O. tigrinum*; Mr. C. Osborne, gr. to H. J. Robinson, Esq., 2nd.

Fruit was well shown by Mr. Bennett, gr. to Hon. C. H. Wynne, Rag, Corwen; Mr. Elsworthy, Mr. G. Middleton (gr., Rainford Hall), Mr. Sires, Mr. Broome, Mr. Hannage (gr., Hooton Hall), and others.

LEWES CHRYSANTHEMUM.

NOVEMBER 16, 17.—This show was held in the Corn Exchange on the above date, and proved to be the finest ever held in the old county town for Sussex. The quality of the blooms was very high, and in the classes for twenty-four incurved, and also for twenty-four Japanese, it was exceedingly difficult to adjudicate. All the classes were strongly contested, some of them having as many as twenty competitors.

For a group of Chrysanthemums, not exceeding a space of 60 square feet, Mr. G. Carvill, School Hill, was 1st, with a well-arranged collection. This group was backed up around the outside with moss, and made a much more characteristic finish than when Palms, &c., are used. 2nd, Mr. J. Edwards; 3rd, Mr. E. Funnell; 4th (extra), Mr. Bedford.

Cut Flowers (open).—For twenty-four incurved, distinct, Mr. J. Wallis, gr. to J. Mews, Esq., was 1st; Mr. Sayers, gr. to Mrs. Cook, and Mr. Jupp, gr. to G. Boulton, Esq., making a good 2nd and 3rd respectively.

For twenty-four Japanese, distinct, Mr. Wallis was again a good 1st; 2nd, Mr. Sayers; 3rd, Mr. J. Blake; 4th, Mr. Helman.

Twelve incurved.—1st, Mr. Tourle; 2nd, Mr. Emery.

Twelve Japanese.—1st, Mr. Voss, with a magnificent lot of bloom; 2nd, Mr. Emery; 3rd, Mr. A. F. Grace.

Six incurved.—1st, Mr. Tourle; 2nd, Mr. Emery; 3rd, Mr. Collins.

Six Japanese.—1st, Mr. Voss; 2nd, Mr. Tourle; 3rd, Mr. Emery.

Six incurved, any variety.—1st, Mr. Baker; 2nd, Mr. Jupp; 3rd, Mr. Sayers.

Six Japanese, any variety.—1st, Mr. Voss; 2nd, Mr. Emery; 3rd, Mr. Tourle.

Plants (open).—Four pyramids.—1st, Mr. Smith, gr. to C. R. Kemp, Esq.; who was also 1st for four dwarf-trained, and for four standards.

Mr. E. Stidworthy was 1st in both classes for six untrained Pompons, and for twelve untrained large-flowering varieties.

Fruit.—This was extensively shown, and of good quality.

For three bunches of Grapes, Mr. Stidworthy, Mr. Gore, and Mr. Smith, took honours in the order given.

Three dishes of dessert Apples brought about twenty competitors.—1st, Mr. G. Helman, gr. to Viscount Gage; 2nd, Mr. W. Maoton; 3rd, Mr. J. Hopkins, gr. to Mrs. Thornton.

Three dishes of culinary Apples.—1st, Mr. Blake; 2nd, Mr. Hopkins; 3rd, Mr. Geale; 4th (extra), Mr. G. Helman.

The best tray of vegetables.—1st, Mr. Collins; 2nd, Mr. Watkins; 3rd, Mr. Manton; 4th (extra), Mr. Geale; highly commended, Mr. Helman. This was a very strongly contested class.

Primulas and Cyclamen were also well shown, and much competition resulted for the numerous special prizes offered by gentlemen and leading seedsmen.

SCOTTISH HORTICULTURAL ASSOCIATION CHRYSANTHEMUM EXHIBITION.

NOVEMBER 17.—In the early morning of Thursday, the 17th inst., there was great enthusiasm in the Waverley Market among the promoters of the above Society and the exhibitors who were to take part in the floral contest; fog was dense, and frost somewhat severe, but no one seemed daunted, or seemed to feel that there was any chance of failure, and by 10 o'clock the sun broke through the mist, which gave bright hopes to the busy throng engaged with the exhibition. The entries this season were 849, against 812 last year, and 2176 Chrysanthemum blooms were tabled in prime condition. The Chrysanthemums, of course, were the leading feature of the show, though other objects of interest were in abundance. The City of Edinburgh Cup, value £20, was won by Mr. Parker, gr. to J. Corbett, Esq., Impney, Droitwich, with forty-eight blooms of Japanese Chrysanthemums, which, for uniform excellence, could hardly be surpassed. This is the third time that this clever cultivator has brought his exhibits across the border to meet Scotchmen in friendly rivalry, and who were vanquished by him on this occasion. Mr. McHattie, gr., Newbattle Abbey, who has been the leading prizewinner for some years, having retired for a season for unavoidable reasons, and thus left the field still more open to Mr. Parker. Among the best of the blooms from Impney were Boule d'Or, W. Tricker, Mr. A. H. Neve, Vivand Morel, Avalanche (remarkably fine), Florence Davis, E. Molyneux (we have seen this finer from Mr. Parker), Lady E. Lawrence, W. W. Cole, R. Brocklebank, Alberic, Etoile de Lyon, Mrs. E. Beckett, Mrs. Laing, W. H. Lincoln, of extra merit; Gloriosum, Stanstead White, Mrs. F. Jameson, Madame C. Audiguier, Stanstead Prize, Sunflower, Jeanne Delaux, J. Delaney, Geo. Atkinson. The 2nd prize lot came from Mr. J. S. Carruthers, also a remarkably fine exhibit of large and handsome blooms—his Sunflower, Vivand Morel, Pelican, Bouquet de Dame, Mrs. J. Thomson, Boule d'Or, Condor, Mrs. E. W. Clarke, were remarkably fine; the 3rd prize went to Mr. J. Bessant, who had fine Florence Davis, Stanstead White, Boule d'Or, Edwin Molyneux, Sunflower, Vivand Morel, Elaine, which were remarked for their fine form. A stand of blooms sent by Mr. P. Blair, gr. at Trentham, was placed 5th, which experts said should have been 3rd, and a mistake was supposed to have been made. The winner of the Scottish Challenge Cup (open to Scottish gardeners and amateurs only) for thirty-six blooms, eighteen incurved and eighteen Japanese, distinct varieties, was taken by Mr. Watt, Black House, Killmorlie. Among his best Japanese were Vivand Morel, Bouquet de Dame, Sunflower, W. H. Lincoln, and Boule d'Or; the incurved varieties were not so fine, John Doughty, Jeanne d'Arc, Lord Alcester, Empress of India, Golden Empress, and Lady Hardinge, being some of the best. Mr. D. Nicoll, gr., Rossie, For-gendenny, was 2nd.

In the class for twenty-four blooms, comprising twelve Japanese and twelve incurved varieties, Mr. Parker again came grandly to the front. In his Japanese lot were Boule d'Or, Florence Davis, E. Molyneux, W. H. Lincoln, Vivand Morel, in very fine form. The incurved varieties were perfect models, and outdistanced all others; J. Lambert, extra fine; Golden Empress, Queen of England, Mr. Heale, Lord Alcester, Princess of Wales, Princess of Teck, Mrs. Coleman, and Mrs. Davis, being the more remarkable ones. Mr. Blair was a good 2nd.

For twenty-four Japanese, Mr. Ruskin, Duntocher, was 1st, with a fine exhibit. Bouquet de Dame was of much excellence; Elaine, Sunflower, Mons. Bernard, Mrs. E. W. Clarke, and W. H. Lincoln, were among the best; 2nd place went to Mr. Ramsay, Corstorphine, for fine blooms.

For twenty-four incurved, not less than twelve varieties, brought some fine flowers for competition, Mr. Parker 1st, Mr. Shoemith 2nd.

For the Messrs. Carter & Co.'s, seedsmen, prize, for twelve Japanese varieties, the 1st prize went to Mr. Perie, Selkirk; 2nd prize to Mr. Ruskin.

The other dozen and half classes were well represented, and in which were some of the finest flowers in the show.

Bouquets of Chrysanthemums were attractive, and some of them very handsome.

Messrs. Laird took the lead in the Nurserymen's class with forty-eight fine blooms distinct.

In the groups of plants arranged on the floor, Mr. Hood, gr., Oswald Road, was 1st; and Mr. Petrie, gr., Murrayfield, was 2nd. Their exhibits were circular in form, and did much to break up the space in the large hall, which lacked the usual tables of plants.

Messrs. Methven & Sons made a fine display with plants arranged in triangular form, and a belt of flowering plants placed as an edging were effective. Among their best flowers in their Chrysanthemum group were W. H. Lincoln, Golden Beverley, and Mr. W. Holmes. This was one of the best exhibits of the kind ever seen in Waverley Market.

Among novelties was a bride (in wax) fully attired in bridal costume, with bouquet in hand, and numerous bouquets arranged around the figure. The bouquets were large, and made up with Odontoglossums, Carnations, Roses, and Chrysanthemums. Other items for ornament were largely represented by the City tradesmen, including vases and dessert services in various forms, which had many admirers.

An object, which was novel and very instructive, was arranged in a conspicuous position, though simple, was very attractive, especially to cultivators of Vines and Tomatos. Numbers of the most beautiful Vine leaves ever seen were arranged in ornamental form, which showed the effects of cultivation, also of soil and climate. Lady Downes, Gros Colmar, Alicantes, Gros Maroc, and others were very beautiful for table decoration. These are much sought after. Barbarossa is often cultivated for this purpose alone. The Tomatos were fine examples of high cultivation in clusters on the stems, which is the true test of good culture. Mr. Buchanan, from the Vineyard, Kippen, near Stirling, who was the exhibitor, attributed his great success to the manure which he used, viz., the well-known Clovenfords Vine Manure.

A grand table of Carnations and Picotees was exhibited by Mr. Campbell, Blantyre Nurseries. These are the coming flowers, the "Mums" must to some extent make room for them. There are now many extensive growers of these for winter work in northern gardens. Mr. Campbell exhibited many seedlings among his cut flowers.

The groups of Conifera in pots from Messrs. Dickson & Sons and Laird, filled up a large space. The selection of plants was very choice, and in capital form, showing their characteristics to much advantage. The usual large exhibits of Primulas (obconica, sinensis, single and double) were very fine, and mostly extra well-flowered.

Roman Hyacinths were very numerous, and well-flowered. Cyclamens also were good, and much admired; and table plants were keenly competed for, which were mostly Dracaenas, Crotons, Aralias, and Pandanus; all of them were in fine form for the purpose for which they are used.

Mr. Parker had the finest Japanese bloom in the show, viz., Boule d'Or; the same exhibitor had the finest incurved bloom in Lord Alcester.

The *Gardeners' Magazine* Medal was awarded to Mr. Campbell, of Blantyre, for a table of Carnations.

Fruit and Vegetables.—These were of the finest quality seen in November in the north. The new Grape exhibited by Mr. McIndoe, from Hutton Hall, had the society's special Certificate. I think no black Grape at this season can equal it for flavour. It is juicy like Duke of Buccleuch, sweet, and thin skinned; the footstalks short and stout, and the berries like first-class Gros Colman, having every quality that a first-rate Grape should have.

An exhibit on a large table from Messrs. Dickson & Co., was an object-lesson, showing young trees trained and ready for planting; the roots having been lifted, pruned, and specially prepared. The roots at each tree were a dense mass of fibre, which all young trees should have. A large collection of Apples was exhibited by this firm, who make hardy fruits a specialty—and some of the finest examples in the exhibition were there.

In the Grape classes, Mr. Murray, Parkhall, had the lion's share of the best prizes. For four bunches he was placed 1st, with fine Gros Colman, a large bunch of Mrs. Pince, Alicante, and Mrs. Pearson; the 2nd prize went to Mr. Leslie, Perth, whose bunches of Muscats and Alicante were of extra merit; Mr. McIndoe, Hutton Hall, received 3rd award.

For Muscats of Alexandria, Mr. Leslie tabled two of the finest bunches we have observed this season; Mr. Kidd, Carberry Towers, was 2nd.

Mr. Leslie was 1st for remarkably fine Alicantes, and Mr. Murray's 2nd prize exhibit were also

good. Mr. Murray was 1st for Gros Colman, and Mr. Leslie 2nd.

Mr. Murray was 1st for beautifully-finished Lady Downes, Mr. McIndoe 2nd, and Mr. Leslie 3rd.

For any other variety, black, Mr. Lant Keir, gr., was 1st, with two finely-formed Mrs. Pince; Mr. McIndoe, 2nd, with Gros Guillaume; and Mr. Murray 3rd, with finely-grown Mrs. Pince, but deficient in colour.

Pine-apples were not numerous, or of great merit. A neatly-grown Queen came from Mr. McIntyre, The Glen; and a fair smooth Cayenne from Mr. Kirk, Alloa.

The other fruits in their classes came from these two growers, who took the only prizes awarded, Mr. McIntyre in each case being 1st. Why he clips every bit of natural covering from his Pines is hard to tell; but he defeats the object he has in view by so doing.

In the collection of twenty kinds of Apples, and ten of Pears, Mr. Dow, gr., Newlyth, had some well-grown fruit; Mr. Wilson, Auchincrive, was a good 2nd.

Mr. McIndoe was a grand 1st in the class for eighteen dishes of Apples and eight of Pears. Mr. Cairns, Hirsell Gardens, was a creditable 2nd.

In the other classes of hardy fruits, there were some finely-coloured dishes, while the most of them showed the effects of an untoward season. The baskets of Apples were poor.

The collection of fruits (twelve varieties) was well competed for by Mr. McIndoe and Mr. Murray, Culzean Castle; the southern exhibit, being extra strong in hardy fruit, had an easy victory over those from Ayrshire.

The tables of Apples from Nova Scotia were of much excellence, and one of the most attractive exhibits in the hall. Gloria Mundi, Portia, Baldwin, King of Pippins (of extra colour), Blenheim Pippin, Pudsey Rose, and Pumpkin Russet were superb. Alexander had the finest colour we ever saw, but such varieties as Golden Pippin and Ribstons were small and poor in appearance.

The Potatos, Carrots, Turnips, Celery, Onions, and Leeks especially were remarkably fine. The last-named, from Mr. Cairns, Hirsell Gardens, were said by some old exhibitors to be the finest ever seen in Edinburgh. The collections of vegetables of twelve and eight sorts were grandly represented. Mr. Fender, from Cultoquhey Gardens, Crieff, was 1st for twelve, which were so attractive that crowds lingered around them all the day; Mr. Johnston, Hawick, was 2nd; and the distinguished vegetable grower, McBean, was 3rd—all first-rate. Salads were good, and Tomatos in large quantities, Mr. Murray, Park Hall, being 1st.

TREES AND SHRUBS.

PINUS CEMBRA.

I FIND this Pine will not grow in our strong chalky soil, South Hants, although it is not a wet one. This is much to be regretted, as several that were planted a few years ago, have died. We are situated on a hill 395 feet above sea-level. I mention this fact about this species of Pine, to put those on their guard who may intend to plant it. Thinking to induce it to grow, several were lifted as soon as they showed symptoms of decay, and peat and leaf-mould were added to the soil about their roots, which had the effect of somewhat re-invigorating them, but directly the roots reached the limit of this soil and were in contact with the staple, the benefit was at an end. E. M.

ARALIA SPINOSA.

The spiny Angelica tree, with its large, rough, bipinnate leaves, and ovate, acuminate, and deeply serrated leaflets, borne on prickly woody stems, producing many-branched panicles beset with velvety down, ending in wide-spread umbels of small white slightly-reflexed blooms, is a desirable subject for planting on the lawn or grouping in the foremost lines in a shrubbery. In the low moist woods of its native home, Virginia, it often attains to the height of 10 or 11 feet, a stature it rarely reaches in this country, because it is seldom planted in the proper situation, but a warm dry soil or position is supposed to suit it. The gardener thinks, no doubt, that the plant is not quite hardy here. In opposition to this practice, the plant should be grown

at first in whatever position seems most favourable, whereby its endurance (on given sites) alone can be properly tested. Moreover, when it is considered that the plant often loses its shoots, which die back to the stools in winter, as does the Raspberry, it is evident that it is quite hardy, and is less injured by frost than is generally imagined. In any case, solitary, weak examples, living, rather than growing, upon exposed sites, are by far the most liable to injury and sudden failure. *William Earley.*

LIGUSTRUM QUIHOU.

Considering that this Chinese Privet does not flower until most of its relatives have finished, it is a pity that it should be so little known. The majority of the genus flower during July and August, but the species now under notice is not in bloom before September and October, and it is not unusual for it to extend its floral display until the first week in November. It is just about twenty-four years ago since it was received in English gardens from China, and was named in compliment to Mr. Quihou, of the Jardin d'Acclimatation, Paris. It forms a loose freely-branched bush, rising to a height of 6 to 8 feet, and 5 to 6 feet through; its branches, which are given off irregularly, are freely supplied with dark shining green oblong leaves, each measuring from 1 to 2 inches long. The flowers are borne in loose terminal panicles, and are pure white; they emit a powerful odour, which to some persons is disagreeable, but this can be avoided by planting a little distance from the walk (this remark applies with equal force to the Mock Orange). The shrub, when out of flower, is not the best to look upon, as it presents a somewhat ragged appearance; but ample amends are made when the shoots are terminated by panicles of such valuable flowers, and that, too, when few other plants are in bloom. Like *L. sinense*, it flourishes in poor soils.

PERIPLOCA GRÆCA.

This is an old inhabitant of our gardens, having been grown therein for upwards of three centuries. It is found wild in the southern parts of Europe. The plant is hardy, and passes through our British winters without injury. For covering bare spaces on walls, arbours, tree stumps, &c., it makes a suitable subject. It can also be used as a town climber to advantage, as the smoke seems to have little effect upon it. It is of rapid growth, reaching as high as 20 feet, and produces long shoots which have a dark brownish rind, and deep glossy green leaves, which are lanceolate in shape, and vary from 3 to 5 inches in length. Its brownish-red flowers, though not individually pretty, have a very uncommon appearance when seen hanging in dense clusters from the axils of the leaves in the middle of July. A point greatly in favour of this old-fashioned twiner is its adaptability to the various kinds of garden soils—none seems to come amiss to it. *H.*

HEDYSARUM MULTIJUGUM.

This shrub is of recent introduction, having been cultivated in British gardens for barely ten years; at present it is somewhat scarce. It is quite hardy, and very free-flowering, besides being one of a very small number of pea-flowered plants which flower out-of-doors towards the end of the month of September. The usual flowering time is the middle of August, but a succession of flowers is kept up for one month or five weeks. The plant is of a bushy habit, from 3 to 5 feet high, furnished with numerous side-shoots, on which are borne the axillary racemes of bright red-coloured blossoms, which are produced on quite young plants. The leaves consist of small oblong leaflets in number from twenty to thirty-five, pea-green above and slightly downy beneath. Planted in porous loam, to which a little leaf-mould is added, it cannot fail to be an attractive object in the garden. Seeds, which freely ripen in this country, may be sown soon after they are gathered in light soil, and placed in a warm greenhouse; and when germinated, the seedlings should be handled carefully, and very sparsely

watered, or damping-off will occur. The plants should be potted in small pots, kept near the glass, and when of sufficient size they should be planted out-of-doors. *H.*

Obituary.

JOSEPH SPIBY.—We regret to record the death of Mr. Joseph Spiby, which occurred on Saturday, the 12th inst., at the age of sixty-six years. The deceased was Head Gardener at Sutton Hall, Loughborough, for forty-one years, and was a much-respected and excellent gardener. He had been for nearly twenty years the Secretary of the Sutton Bonnington Horticultural Society.

THE WEATHER.

[By the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

The districts indicated by number in the first column are the following:—
 0, Scotland, N. Principal Wheat-producing Districts—1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, S.
 Principal Grazing, &c., Districts—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; (* Channel Islands.)

THE PAST WEEK.

The following summary record of the weather for the week ending November 19, is furnished from the Meteorological Office:—

"The weather was mostly dull and unsettled, with considerable falls of rain in all but the eastern districts; and with occasional fogs over the inland parts of England.

"The temperature was above the mean in all districts, excepting 'Scotland, E.,' 'England, N.E.,' and 'Ireland, S.,' the excess being slight in the western parts of the kingdom, but large (3° to 5°) over our eastern, Midland, and southern counties. The highest readings were observed on the 14th or 15th, when the thermometer rose to 55°, or a little above in Ireland and Scotland, and to 60° or a little above in most parts of England. On the 18th the daily maxima over 'England, N.,' were only a degree or two above the freezing point. The lowest readings, which were registered on the 18th or 19th, ranged from 21° in 'Scotland, E.,' (at Braemar) and 24° in 'England, N.E.,' to 30° in 'England, S.,' and to 38° in the 'Channel Islands.'

"The rainfall was considerably in excess of the average over Ireland and the south of England, and slightly in excess over the eastern parts of Great Britain and the Channel Islands. Elsewhere the

aggregate fall was either less than or equal to the normal.

"The bright sunshine was again very deficient in all the English and Scotch districts, but a little more than the average in the south of Ireland. Over the northern and central parts of Great Britain the duration only reached 8 or 9 per cent. of the possible amount, but in Ireland and the south-west of England the percentage value was 20 or 21."

MARKETS.

COVENT GARDEN, November 24.

[We cannot accept any editorial responsibility for the sub-joined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they fluctuate, not only from day to day, but often several times in one day, Ed.]

MARKET VERY DULL WITH GOOD SUPPLIES, AND PRICES UNALTERED. *James Webber, Wholesale Apple Market.*

POTATOS.

Market still continues very firm for best samples, at prices from 80s. to 90s. Owing to the large arrivals of foreign Potatoes, which are of fair quality, it tends to keep the prices low of our home-grown ordinary sorts; in fact, they are a drag even at the low prices they are being sold at. *J. B. Thomas.*

SEEDS.

LONDON: Nov. 23.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., write, that for American Red Clover seed, there is a steadily improving demand, at hardening rates. The crop on the other side appears, without doubt, to be a short one. Germany has recently been a heavy buyer in the trans-Atlantic market, and France has been taking handsome profits by re-selling to America, its early purchases of seed not yet shipped. There is no change this week in either Alsike, White, or Trefoils. Ryegrasses keep firm. For Koenigsberg Tares there is a good inquiry. Winter Vetches are neglected. Canaryseed is steady but quiet. For Hempseed values are

strong. Dutch Haricot and White Runner Beans offer at tempting rates. Blue Peas show no alteration. Both White and Brown Mustard continue scarce. Rapeseed is now very cheap. Not much doing in Linseed.

FRUITS AND VEGETABLES.

SPITALFIELDS: Nov. 23.—Quotations:—English Apples, 2s. 6d. to 7s. per bushel; American, do., 12s. to 18s. per barrel; Pears, 2s. to 3s. per half-sieve; English Tomatos, 4s. to 6s. per peck; foreign, do., 1s. to 1s. 6d. per box; Cauliflowers, 1s. 9d. to 4s.; Savoys, 2s. to 3s.; Collards, 1s. 9d. to 3s. 6d. per tally; Curly Kale, 1s. 3d. to 1s. 6d.; Spinach, 1s. to 1s. 9d. per bushel; Sprouts, 1s. 3d. to 1s. 9d. per half-sieve; Turnips, 1s. 6d. to 2s.; Greens, 1s. 6d. to 2s. 6d.; Carrots, 1s. 6d. to 2s. 6d.; Parsley, 1s. to 2s. per dozen bunches; Parsnips, 4d. to 8d.; Cos Lettuce, 4d. to 1s. per score; Endive, 4d. to 8d.; Leeks, 1s. 6d. to 2s.; Cabbage Lettuce, 6d. to 8d.; Frame Cucumbers, 1s. 6d. to 2s. per dozen; Celery, 8d. to 1s.; Horseradish, 1s. to 1s. 2d. per bundle; English Onions, 5s. to 6s. per cwt.; Spanish, do., 4s. 9d. to 5s. 6d. per case; Bordeaux, do., 2s. 6d. to 4s. per case; Belgian and Dutch, do., 3s. 6d. to 4s. 3d. per bag of 110 lb.; Carrots, 2s. to 4s. per ton.

BOROUGH: Nov. 22.—Quotations:—Cabbages, 2s. to 2s. 6d. per tally; Cauliflowers, 9d. to 1s. 3d. per dozen; Spinach, 1s. to 1s. 6d. per bushel; Sprouts, 1s. to 1s. 3d. per half-sieve; Carrots, 2s. 6d.; Turnips, 1s. 6d.; Parsley, 1s. 6d. per dozen bunches; English Onions, 6s. to 6s. 6d.; Dutch do., 5s. per cwt.; Horseradish, 2s. to 2s. 3d.; foreign do., 1s. 6d. per bundle; English Apples, 2s. 6d. to 10s. per bushel.

STRATFORD, Nov. 23.—There has been an excellent supply of all kinds of produce at this market during the past week, and a brisk trade was done as under:—Cabbages, 2s. to 3s. 6d. per tally; Savoys, 3s. to 5s. do.; Greens, 1s. to 1s. 6d. per dozen; Cauliflowers, 1s. to 1s. 6d. do.; Turnips, 1s. 6d. to 2s. per dozen bunches; do., 25s. to 40s. per ton; Carrots, household, 4s. to 5s. do.; do., cattle-feeding, 2s. to 3s. do.; Parsnips, 5s. to 6s. per ton; Mangolds, 1s. to 1s. do.; Swedes, 1s. to 2s. do.; Onions, English, 5s. to 6s. per cwt.; do., Dutch, 4s. to 5s. do.; Apples, English, 2s. 6d. to 5s. per bushel; do., American, 12s. to 20s. per barrel; Brussels Sprouts, 1s. to 1s. 6d. per half sieve; do., 1s. 9d. to 2s. 6d. per sieve; Celery, 8d. to 1s. 2d. per roll; Horseradish, 1s. 6d. to 1s. 9d. per bundle.

GENERAL AVERAGES: Nov. 23.—Magnums, 50s. to 75s.; Hebrons, 60s. to 75s.; Regents, 60s. to 70s.; Snowdrops, 60s. to 80s.; Imperators, 50s. to 65s. per ton.

FARRINGTON: Nov. 24.—Quotations:—Onions, Kent, 7s. 6d. per bag; Spanish do., 6s. per case; Parsley, 1s. 6d. per bushel; Carrots, 2s. 6d. per bag; Turnips, 5s. per ton; Horseradish, 1s. 6d. per bundle; Apples, American, 12s. to 16s.; Tomato, 12s. per 56 lb.

POTATOS.

SPITALFIELDS: Nov. 22.—Quotations:—Snowdrops, 65s. to 75s.; Reading Wonder, 57s. 6d. to 65s.; Bruce Magnums, 50s. to 70s.; Imperators, 55s. to 65s.; Regents, 52s. 6d. to 69s.; Magnums, 55s. to 65s. per ton.

BOROUGH: Nov. 22.—Quotations:—English Magnums, 55s. to 65s.; Hebrons, 60s. to 65s.; Snowdrops, 60s. to 70s. per ton.

STRATFORD: Nov. 23.—Quotations:—Darkland Magnums, 5s. to 5s. do.; do., 55s. to 65s.; Bruce Magnums, 60s. to 70s. per ton.

FARRINGTON: Nov. 24.—Quotations:—Kent Magnums, 75s. to 80s.; Bedford do., 70s. to 80s. per ton.

CORN.

Averages.—Official statement of the average prices of British corn, imperial measure (quarter) for the week ending November 19, and for the corresponding period last year:—1892: Wheat, 27s. 11d.; Barley, 26s. 7d.; Oats, 18s. 1891: Wheat, 38s. 9d.; Barley, 31s. 5d.; Oats, 22s. 4d.

HAY.

Averages.—The following are the averages of the prices at the principal metropolitan markets during the past week:—Clover, prime, 80s. to 115s.; do., inferior, 50s. to 75s.; Hay, best, 75s. to 112s.; do., inferior, 45s. to 65s.; and Straw, 23s. to 41s. per load.

NOTICES TO CORRESPONDENTS.

, PHOTOGRAPHS, DRAWINGS, OR SPECIMENS.—We shall be pleased to receive from our Correspondents notes relating to interesting Gardens, together with Specimens or Illustrations of interesting Plants. Although circumstances prevent us in all cases from reproducing them, we are nevertheless glad to receive them, and as far as possible to utilise them for the benefit of readers.

ANTS: R. M. Try carbolic acid, strewn about the floor of the house and in the runs of the ants.

CALANTHE AND CŒLOGYNE LEAVES: G. S. We find no disease in the leaves sent. Decay probably arises from a too damp atmosphere, or from injudicious watering. The Cœlogyne leaf also is the effect of bad culture—probably error in watering during summer, or from bad ventilating.

CARNATION DISEASE: S. B. See our last week's issue.

CELERY ROT AND CARNATION DISEASE: X. The decay in Celery may have been caused by earthing-up too early, or from allowing soil to enter the heart of plant. A wet season also is extremely favourable to such injury—it is not caused by any disease. The Carnation is attacked by the Carnation-fungus. See illustration and note in this column in our last issue.

CHRYSANTHEMUM: G. O. We cannot name the variety. The sport is pretty, but there are so many.—*T. S., Ireland.* A proliferous head of bloom, analogous to that known in the Daisy as Helen and Chickens.

COCKCHAFER GRUBS IN PRIMULA POTS: J. H. Try the effect of watering the soil with clear lime-water (quicklime). It drives out worms, and may cause the grubs to come to the surface. It will do no harm to the plants.

FLORAL GUM: A. H. Purchasable of any dealer in horticultural requisites. We cannot tell you what the ingredients consist of.

FUNGUS: C. S. & Co. Without the slightest information being afforded by the sender, it is difficult to say positively what any agaric is at this season when so saturated with moisture, but apparently this one is *Agaricus (Stropharia) aruginosus, M. Cooke.*

GRAPES DROPPING: G. E. Your initials were by an oversight omitted, but the information supplied to our other correspondent will apply in your case. We may here remark that strong fumigation with tobacco will cause the berries, if ripe, to fall.

LOBELIA CARDINALIS: A. B. This is a Canadian water-side plant, which is not hardy here, because it is exposed to alternate freezing and thawing. The roots may be taken up in late autumn, and stored in shallow boxes, packing the roots tightly round with fine leaf-mould, but not covering them. Keep them in a cool pit, where they will not freeze or become dry. In March or April pull the roots to pieces; every bit with a bud being potted will make a nice plant for planting out in May. After dividing and potting them in leaf-mould and loam, stand them at the warm end of the greenhouse, or in a pit with a mild bottom heat till established—no longer; afterwards putting them in a cool frame.

NAMES OF FRUITS: J. J. D. 1, Pear not recognised; 2, Ne plus Meuris; 3, Gansell's Bergamot; 4, Beurré de Capiaumont; 5, Adams's Pearmain; 6, Maltster; 7, Scarlet Nonpareil; 8, Dutch Mignonne; 9, not known.—*D.* We do not recognise the Apples you sent us.—*A. Allum.* 1, Soldat Laboureur; 2, White Doyenné; 3, Van Mons. Leon de Clere; 4, Urbaniste; 5, Duchesse d'Angoulême (probably); 6, Louise Bonne of Jersey; 7, Hawthornden; 9, Mère de Ménage; 10, Braddick's Nonpareil; 11, Scarlet Nonpareil.—*Edw. G. Allen.* 1, Bedfordshire Foundling; 2, Striped Beefing; 3, Hillingdon Pippin; 4, Court Pendu Plat; 5, Grange's Pearmain; 6, Northern Greening; 7, French Crab.—*A. L.* Your Pear is not Comte de Lamy, but Duchesse d'Angoulême, and is a dessert variety.—*W. H. D. I.* Besspool; 2, Blenheim Orange; 3, not recognised; 4, Golden Reinette; 5, Scarlet Nonpareil; Pear Rouse Lench.—*W. C. & Son.* Apple Beauty of Kent.—*J. G.* 1, Hornead's Pearmain; 2, Cox's Pomona; 3, Wadburat Pippin; 4, Rosemary Russet; 5, Humbledon Deux-ans; 6, Tower of Glamis.—*B. W. A. I.* Beauty of Kent; 2, not sent; 3, Warner's King; 4, Brownlee's Russet; 5, King of the Pippins.—*F. D. and Johnson.* Apple Golden Noble.—*J. E. & N.* 1, Passe Colmar; 2, Beurré de Capiaumont; 3, Beurré Diel; 4, Apple Smart's Prince Arthur; 9, not recognised; 80, Gravenstein; 82, Potts' Seedling.—*C. W. Strickland.* Pear: 1, Gansell's Bergamot; 2, Bellissime d'Hiver, probably. Apple not recognised.—*Thick Head.* 1, not identified; 2, Tibbett's Incomparable; 3, Crimson Queening; others not recognised.—*T. Singleton.* 1, Waltham Abbey Seedling; 2, Forge; 3, Dutch Mignonne; 5, Old Nonpareil; 7, Grange's Pearmain; 12, Lady Henniker. The Pears we do not recognise.

NAMES OF PLANTS: T. B. The specimen sent is the fruit of the common *Eucynymus europæus*. Botanical name of the Butcher's Broom is *Ruscus aculeatus*.—*E. D. L.* 4, *Aster cordifolius elegans*; 5, *Aster novi-belgii densus*; 6, *Atractylis lancea*.—*J. L. C.* Apparently a *Melilotus*, but specimen unsatisfactory.—*A. B.* *Thuia* or *Biota orientalis*, arbor-vita of gardens.—*H. K.* *Catasetum luridum*, *Bot. Reg.* xx, 1667.—*R. J. I.* 1, *Lælia autumnalia* var; 2, *Tydia formosa*.—*J. B. S. I.* *Catasetum* sp., send the spike before it goes off; 2, *C. macrocarpum*.—*G. P.* *Athyrium f.-f.* *Frizellia*; the other, probably *Ruellia Devosiana*.—*E. L. H.* A variety of *Quercus Ilex*.

NATIVE GUANO: H. K. A. Various artificial manures are so called, the chemically-treated residue of the A.B.C. process of deodorised sewage, amongst them which from its almost total lack of nitrogen is of relatively little value as a manure, the urine containing the nitrogen having passed away with the water in the settling process. An excellent native guano could be made out of night-soil without the addition of water if it were treated with acid or phosphatic materials, or with finely-sifted dry loam or powdered clay. Something similar to this is the product of Moule's earth closet, after the material has been employed as a deodoriser five or six times; which may readily be done by having it dried after each employment of it. This is a storeable compound, nearly odourless, and almost equal to Peruvian guano as a stimulus to growth.

PEAS IN EXPOSED GARDEN: J. F. See p. 650, present issue, for varieties which would suit your exposed garden. To these you might add Dr. Maclean, Gladiator, Maclean's Wonderful and Sturdy, all of which are about 3 feet in height, and of the finest quality. Do not sow out-of-doors till the spring.

SKELETONIZING LEAVES: Hortus. Make use of leaves in their prime, and separate those containing much tannin, as Oak, Beech, Chestnut, Willow, Walnut, Hazel, &c., from those deficient in that substance. Put the leaves in an earthen-pan that will hold not less than a gallon, and cover them with rain-water. Let the pan remain exposed to sun and weather, gently stirring the leaves occasionally till the outer or green part of the leaves sticks to the fingers—some leaves take several months to reach this stage, others a few weeks only. Take them out and wash out the substance of the leaf by shaking about in clean water placed in a shallow pan, keeping them steady with the finger on the stalk, whilst the decayed parts are removed with a rather stiff brush. When quite freed from the cuticle, bleach them in chloride of lime and water, two tea-spoonfuls to one gallon of water. When bleached, put them into clean water for a day or two, and then spread them on blotting-paper under pressure.

STRAWBERRY FRUITING IN NOVEMBER: B. P. The fruit is small, and not very tempting. Kindly send promised plants in the spring.

STRAWBERRIES: J. W. As you are not versed in Strawberry forcing, it would be better if forcing were delayed till the middle of January. Meantime keep the plants as cool as possible, but do not allow the soil in the pots to become dry. Afford the utmost amount of air when there is no very hard frost. The maximum day temperature when forcing is begun, may be 50° by day, at night 42° to 45°; and these degrees of warmth may be increased about 1½° per week till the plants flower and fruit sets, when the figures may be 60° and 70°.

FIXED.

THE IMPROVED GARDEN GULLY (VINCE'S PATENT).

This useful invention is a great improvement on the ordinary Garden Grating, and is especially suitable for hilly walks and drives. As they never get stopped by rubbish or sand they effectually prevent the washing away of the gravel in heavy storms, and they save half the labour in cleaning out the cesspools. The prices are—

6-in., 1s. 6d.; 8-in., 2s.; 10-in., 3s.; 12-in., 6s. 6d.; 15-in., 8s. (The larger sizes are very strong for carriage drives.)

Full Particulars on application. Testimonials:—

From Mr. J. WILLARD, Head Gardener to the BARONESS BURDETT-COUTTS, Holly Lodge Gardens, Highgate, N., July 12, 1892.—“Dear Sirs, Having given your Improved Garden Gully a fair trial, I may say that it proves in use all that you claim for it, and in my opinion has, for the sides of walks and drives, many advantages over the ordinary grating. Perhaps the best proof I can give you of this is that, as opportunity offers, I intend to use them instead of gratings. Faithfully yours, J. WILLARD.”—To Messrs. VINCE & VINE.

From W. WALTON, Esq., Secretary to the LONDON CEMETERY COMPANY. The London Cemetery Company, 29, New Bridge Street, Blackfriars, E.C., July 25, 1892.—“To Messrs. Vince & Vine, Highgate. I am very happy to testify that your Patent Garden Gully-Frames in lieu of the old fashioned gratings answer admirably. They were by my authority fixed in a new pathway made in Highgate Cemetery, and in the recent thunder showers they were severely tested and were

most effectual in preventing the scouring of the gravel. At the inspection my Directors were much pleased with them, and gave instructions that they were to be used when required at Nunhead Cemetery.—I am, yours truly, W. WALTON, Secretary.”

From Messrs. CUTBUSH AND SON, Highgate and Barnet Nurseries.—“Highgate Nurseries, London, July 27, 1892.—Dear Sirs,—Referring to the Improved Garden Gully you fixed for us some months ago, we are glad to say it answers admirably. As you are aware, our Nurseries here are very hilly, and during the recent storms all the ordinary gullies were blocked, whereas yours was in good working order. We shall not hesitate to recommend the same to anyone requiring the gullies for sides of paths and carriage-drives, and we feel certain, when it is known, there will be a great demand.—We are, yours faithfully, WM. CUTBUSH AND SON.—Messrs. VINCE & VINE.”

FLORISTS and FRUITERERS.—A young Lady desires re-engagement. Well up in all branches; eleven years' experience; first-class references.—**FLORIST, 48, George Street, Croydon.**

HOLLOWAY'S PILLS.—Dismiss your Doubts.—Let no one be longer oppressed with the notion that his malady is incurable till these purifying Pills have had a fair trial. When ordinary preparations have failed, these Pills have been used with the most marked success. A course of this admirable medicine clears the blood from all impurities, and improves its quality. The whole system is thus benefited through the usual channels without reduction of strength, shock to the nerves, or any other inconvenience; in fact, health is renewed by natural means. For curing diseases of the throat, windpipe, and chest, these Pills have pre-eminently established a world-wide fame, and in complaints of the stomach, liver, and kidneys they are equally efficacious. They are composed of rare balsams, without a single grain of mercury or any other deleterious substance.

AWARDED TWENTY PRIZE MEDALS

AT INTERNATIONAL EXHIBITIONS AT HOME AND ABROAD.

KEITH'S PATENT BOILERS, THE "CHALLENGE," "VIADUCT," "PYTHON," &c.,

FOR HOT-WATER HEATING, "STAND FIRST," require no building work around them, are entirely water-jacketed, and heat from 50 feet up to 20,000 feet of 4-inch pipe respectively. Many thousands are in use all over the world, and the Boilers are unrivalled in power and economy.

Manufactured under 30 James Keith's Patents in Great Britain, United States, and Canada.

This Engraving "illustrates the most powerful form of Boiler that has yet been made for Hot-water Circulation."—Extract from Hood, on *Warming by Hot-water*, New Edition, 1891.

KEITH'S "PYTHON" BOILER, as illustrated, has 1,000 square feet of effective heating-surface, with 17½ square feet of fire-grate area, heats about 20,000 feet of 4-inch pipe, and is the Most Powerful and Complete Sectional "Special" Hot-water Heating Boiler in the World.

MESSRS. PROTHIEROE AND MORRIS will include the above in their SALE on FRIDAY NEXT, December 9.

Great Sale of Filmy and Other Ferns IN SPLENDID CONDITION. JUST ARRIVED FROM NEW ZEALAND, including 120 FINE PLANTS OF TODEA SUPERBA. A fine lot of the scarce Kidney Fern, TRICHOMANES RENIFORME, several HYMENOPHYLLUMS, such as DILATATUM, CRISPATUM, and DEMISSUM. Being all from New Zealand, these are most suitable for growing in Cool or Temperate-houses. Also 18 fine specimens of CYATHEA SMITHII, a scarce and beautiful Tree Fern, with good straight stems or trunks, from 3 to 6 feet high. Included in this Sale will be three ALSOPHILA CRINITA, from Ceylon, one of the rarest and most handsome of Tree Ferns.

MESSRS. PROTHIEROE AND MORRIS will SELL the above by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on WEDNESDAY, December 14, at 12 o'clock. On view the morning of Sale, and Catalogues had.

FRIDAY NEXT. GREAT NORTHERN RAILWAY

10,000 ORCHIDS, AMONG THEM MANY SPECIMENS OF EXTRAORDINARY SIZE. THE WHOLE IN SUPERB CONDITION.

MESSRS. PROTHIEROE AND MORRIS have received instructions from Messrs. F. Sander & Co., St. Albans, to SELL BY AUCTION, on FRIDAY, December 9, about

10,000 ORCHIDS.

The whole are extra fine plants and among them are specimens of unusual size and value; and consist of an extraordinary lot of CATTLEYA ALEXANDRE (we shall have about a dozen plants in flower at Christmas, and cordially invite inspection); a spike will also be on view day of Sale; C. LAHATA, our best type, and all unfloored; grand specimens of Phajus tuberosus, Oncidium ampliatum majus, various varieties of Cologne cristata in splendid specimens, Aerides Lawrenceana and Sanderiana, many seedling Cypridiums, a grand lot of Dendrobis, all set for flowering; many Orchids in bud, ready for Christmas flowering; specimens of Utricularias, great varieties and quantities of Odontoglossums, Cypridiums, and various Cattleyas, such as C. Schradiana, C. Mendel, D. Mosini, etc.; Epidendrum vitellinum majus, and other Epidendrams in quantity; Cymbidiums, Vandas, &c. The whole of this enormous quantity of Orchids in splendid condition and health.

In consequence of the erection of a Railway Station on the Nursery Premises by the Great Northern Railway Company, Five Orchid Houses are being pulled down—and hence this enormous lot of Orchids are offered WITHOUT THE LEAST RESERVE.

Thousands of Cattleyas and Odontoglossums will be included, and a host of rare Orchids and big specimens, a catalogue of which may be had on application to the Auctioneers, as above. On view morning of Sale, and Catalogues had.

Andover. 161 Plots, being the Remaining Portion of the VICTORIA PARK ESTATE, close to the station, and ripe for Immediate Building, at low reserves, to clear up this Estate.

MESSRS. PROTHIEROE AND MORRIS will SELL by AUCTION, at the Star and Garter Hotel, Andover, on FRIDAY EVENING, December 9, at 7 o'clock, 161 PLOTS OF FREEHOLD BUILDING LAND, including a few Shop Plots, occupying a choice position in Junction Road, Andover; immediate possession; easy quarterly payments. Particulars had at the place of Sale, of J. Bacon, Esq., solicitor, New Romney, of the KENT, SUSSEX, and GENERAL LAND SOCIETY, Bank Street, Ashford, and 75, Chancery Lane, W.C., and of the Auctioneers and Land Agents, 67 and 68, Cheapside, E.C.

50,000 Havana Cigars.—Preliminary Notice. By ORDER of the MORTGAGEES

MESSRS. PROTHIEROE AND MORRIS will SELL by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on MONDAY, December 12, at 12 o'clock, 50,000 genuine HAVANA CIGARS, comprising Cabanos, Flor de Cubas, J. S. Miras, Carolinas, Larranagas, Red del Rey Boquets, and 2000 Villa y Villa in cabinets of 25 each, of super extra quality, very rare. On view morning of Sale, and Catalogues had.

Cheshunt.—Great Sale of Fruit Trees. Important to FRUIT GROWERS, MARKET GARDENERS, and GENTLEMEN requiring FRUIT TREES for planting to bear next season.

MESSRS. PROTHIEROE AND MORRIS are instructed by Messrs. T. & G. Oyley (who are compelled to clear the ground), to SELL by AUCTION, on the premises, the Elms Fruit Ground, Park Farm, Cheshunt, 1 1/2 mile from Cheshunt Station, on THURSDAY, December 13, at 12 o'clock precisely, 17,000 clean-grown Bush and Standard FRUIT TREES, 4 to 8 years old, all in splendid condition for transplanting, consisting of Lord Sulfield, Wellington, Early Julian, Keswick Collier, King Pippin, Hawthornden, Warner's King, and many other Apples; 300 Pond's Seedling Plum, Victoria, New Orleans, and other varieties; and about 6000 William, Hazel, Calabash, Beurre de Capuaumont, and other Pears. May be viewed any day prior to the Sale. Catalogues may be had on the Premises; of Messrs. T. AND G. OYLEY, Spitalfields Market; and of the Auctioneers, 67 and 68, Cheapside, London, E.C.

N.B.—The Auctioneers desire to call attention to this important Sale. The trees have been grown by Messrs. Oyley expressly for planting in their own grounds, and consist of such varieties as they have found from their experience to be most profitable for market purposes. The trees have been specially prepared for removal to the new Farm which the Vendors were about to take, but the negotiations having fallen through, with regard to planting it with trees, Messrs. Oyley are compelled to sell them for want of room.

Richmond, Surrey. VALUABLE FREEHOLD and LEASEHOLD INVESTMENTS, also GAS STOCK, by Order of the Executors of Messrs. George and William Steell, deceased.

MESSRS. PROTHIEROE AND MORRIS are instructed to SELL by AUCTION, at the Mart, Tokenhouse Yard, London, E.C., on FRIDAY, December 16, at 2 o'clock precisely, in 23 Lots, the Valuable FREEHOLD RESIDENCE, 1, Lancaster Place, Richmond Hill, occupying a high and choice position; 3 Leasehold Villas, Nos. 1, 2, 3, Old Deer Park Villas, Kew Foot-Road, opposite the Athletic Ground; 14 Leasehold Cottages, Nos. 1 to 14, Old Deer Park Cottages, Rossdale Road, and Piece of Land adjoining, all situate in the borough of Richmond; the whole of the properties are in excellent repair, and are let at very low rentals, amounting to £34 per annum; a Block of Freehold Building Land, situate in Jocelyn Road, Richmond, adapted for the erection of two Villas (for which plans have been prepared), with the Brick-built Stable and Coach-house standing thereon; £820 Debenture and Consolidated Stock in the Richmond Gas Company; and £700 Six per Cent. Preference Stock in the Crystal Palace District Gas Company.

Particulars may be had at the Mart; at the principal Hotels in Richmond; of Messrs. SAMPSON AND MORGAN, Solicitors, 29, Somerset Street, Portman Square, W.; and of the Auctioneers, 67 and 68, Cheapside, London, E.C.

DICKSONS The Nurseries, **CHESTER**
 (Limited).

VICTOR POTATOS
 (SHARPE'S).
 This favourite first early Potato, suitable for any Garden,
 indispensable for Forcing and Early Borders, and likely to take
 the first rank amongst first earlies for market use. Quality
 and yield all that could be desired. One well known market
 grower has this year had a yield of 15 tons per acre on a large
 acreage. London and Manchester salesmen speak highly of
 their quality, and report that Victors will keep their bloom
 and have a fresh appearance after being in the market some
 days, when other early Potatos have become discoloured and
 unsaleable.
 The stock we offer is the true yellow-fleshed variety and not
 the white variety, which is often substituted.
 Price per cwt. and ton. State requirements to
W. W. JOHNSON & SON,
 Seed Growers and Merchants Boston, Lincolnshire.

 ESTABLISHED 1810. [AREA, 150 ACRES]

London County Council.
 PARKS AND OPEN SPACES DEPARTMENT:
 ASSISTANT TO THE CHIEF OFFICER.
THE LONDON COUNTY COUNCIL is
 about to APPOINT an ASSISTANT to the Chief Officer
 of the Parks and Open Spaces Department. The duties attached
 to this post will be to Assist the Chief Officer in matters
 relating to Horticulture in the various Public Parks and
 Gardens in London, and in Supervising and Directing the
 Management of the Open Spaces, and the Laying-out of New
 Grounds, and generally to act in Outdoor-work, under the
 direction of the Chief Officer. Applicants must therefore
 possess a thorough knowledge of the science and the practice
 of Horticulture, and general experience in the Management
 of Parks and Gardens.
 The salary attached to the office is £300 a year, but there
 will be no superannuation or pension. The office will be held
 during the pleasure of the Council, and the holder will be re-
 quired to give his whole time to the duties of his office and
 will not be allowed to take any private business, to hold any
 other appointment, or to occupy any other paid position.
 Applications, containing particulars of the qualifications and
 experience of the applicant must be on the forms to be obtained
 at this office, and must, with copies of recent testimonials
 attached, be addressed to "The Clerk of the London County
 Council, Spring Gardens, S.W.," and be endorsed on the outside
 "Assistant Superintendent, Parks."
 They must be delivered here not later than 10 A.M. on the
 morning of December 9, after which time no application will
 be received. Any application which does not contain all the
 particulars above-mentioned, or which in any other respect
 fails to comply with the terms of this advertisement, will not
 be laid before the Council. Personal canvassing is strictly
 prohibited.
 H. DE LA HOOKE, Clerk of the Council.
 Spring Gardens, S.W., November, 1892.

MYATT'S PROLIFIC, for Sale.—Grown on
 high land, and true; 50s. per 2-Ton Lots; less for
 larger quantity.

Full Particulars on application. Testimonials:—
 From Mr. J. WILLARD, Head Gardener to the BARONESS
 BURDETT-COUTTS, Holly Lodge Gardens, Highgate, N.,
 July 12, 1892.—“Dear Sirs, Having given your Improved Garden
 Gully a fair trial, I may say that it proves in use all that you
 claim for it, and in my opinion has, for the sides of walks and
 drives, many advantages over the ordinary grating. Perhaps
 the best proof I can give you of this is that, as opportunity
 offers, I intend to use them instead of gratings. Faithfully
 yours, J. WILLARD.”—To Messrs. VINCE & VINE.
 From W. WALTON, Esq., Secretary to the LONDON CEMETERY
 COMPANY, The London Cemetery Company, 29, New
 Bridge Street, Blackfriars, E.C., July 25, 1892.—“To Messrs.
 Vince & Vine, Highgate. I am very happy to testify that your
 Patent Garden Gully-Frames in lieu of the old-fashioned
 gratings answer admirably. They were by my authority fixed
 in a new pathway made in Highgate Cemetery, and in the
 recent thunder showers they were severely tested and were

THE IMPROVED GARDEN GULLY
(VINCE'S PATENT).

This useful invention is a great improvement on the ordinary
 Garden Grating, and is especially suitable for hilly walks
 and drives. As they never get stopped by rubbish or sand
 they effectually prevent the washing away of the gravel in
 heavy storms, and they save half the labour in cleaning out
 the cesspools. The prices are:—

6-in., 1s. 6d.; 8-in., 2s.; 10-in., 3s.; 12-in., 6s. 6d.; 15-in., 8s.
(The larger sizes are very strong for carriage drives.)

most effectual in preventing the scouring of the gravel. At
 the inspection my Directors were much pleased with them,
 and gave instructions that they were to be used when required
 at Nunhead Cemetery.—I am, yours truly, W. WALTON,
 Secretary.”

From Messrs. CUTBUSH AND SON, Highgate and Barnet
 Nurseries.—“Highgate Nurseries, London, July 27, 1892.—
 Dear Sirs,—Referring to the Improved Garden Gully you
 fixed for us some months ago, we are glad to say it answers
 admirably. As you are aware, our Nurseries here are very
 hilly, and during the recent storms all the ordinary gullies
 were blocked, whereas yours was in good working order. We
 shall not hesitate to recommend the same to anyone requiring
 the gullies for sides of paths and carriage-drives, and we feel
 certain, when it is known, there will be a great demand.—
 We are, yours faithfully, WM. CUTBUSH AND SON.—
 Messrs. VINCE & VINE.”

 - POPLAR, Weeping, Pyramids and Standards, 10 to 12 feet.
- KNAP HILL NURSERY, WOKING, SURREY.

LAXTON'S
"GRADUS."
A LARGE-PODDED FIRST EARLY PEA.
First-class Certificate from the R.H.S. after trial at Chiswick.
This is without doubt the greatest advance yet achieved in early Peas, for although the variety ripens with "WILLIAM 1ST," the pods are of the size, and as well filled, as those of "DUKE OF ALBANY," with large wrinkled Peas of the "NE PLUS ULTRA" colour when ripe; the variety being only 3 ft. in height, but very productive, and the quality quite equal to that famous Pea, as yet unvanquished for flavour.
"GRADUS" is also the most distinct early Pea yet raised, and is equally good for the table and for show.
To be had in sealed ¼-pint packets only, wholesale from MESSRS.
HARRISON & SONS,
Seed Merchants,
Leicester,
or retail from them; or from
THOMAS LAXTON,
Seed Grower,
BEDFORD.

LARGE SHRUBS, &c.—Arbor-vitæ, American, 1½ to 2 feet, 12s. per 100; do. 3 to 3½ feet, 20s. per 100; Aucuba japonica, variegated and green, 1 foot, 25s. per 100; Berberis aquifolia, 2 feet, 10s. per 100; B. Jamesonii, 2 feet, 20s. do.; Box Tree, 1½ to 2 feet, 12s. per 100; 2 to 3 feet, 20s. do.; B. japonica, 10 inch, 20s. do.; Cotoneaster microphylla, 2 feet, 10s. per 100; C. Simonsii, 2½ to 3 feet, 10s. do.; Dogwood, 2 feet, 10s. per 100; Escallonia macrantha, 2 feet, 24s. per 100; Greshnea littoralis, 10 inch, 30s. per 100; Laurel, Colchic, 1½ to 2 feet, 12s. per 100; 2 to 2½ feet, 14s. do.; 3 to 3½ feet, 20s. do.; rotundifolia, 1½ foot, 13s. per 100; 2 to 2½ feet, 16s. do.; Portugal Laurel, 1½ to 2 feet, 20s. per 100; 2 to 2½ feet, 24s. do.; Rhododendron ponticum, 1½ foot, 22s. per 100; 2 to 2½ feet, 27s. do.; 3 feet, 40s. do.; 3½ to 4 feet, 80s. do.; Veronica Traversii, fine, 1 foot, 20s. per 100; Yews, English, 1½ foot, 24s. per 100; 2 to 2½ feet, 35s. do.; Abies Douglasii 9 to 12 inches, 10s. per 100; 1 to 1½ foot, 16s. do.; 1½ to 2 feet, 25s. do.; Araucaria imbricata, 2 to 2½ feet, 24s. per doz.; 3 to 3½ feet, 35s. doz.; 4 to 4½ feet, 48s. doz.; Cedrus deodara, 2 feet, 8s. doz.; Cupressus macrocarpa, 2 feet, 30s. per 100; spring-moved C. Lawsonii, 2 to 2½ feet, 20s. do.; 3 to 4 feet, 30s. do.; 4 to 5 feet, 40s. do.; C. striata, 3 to 3½ feet, 40s. do.; Erecta viridis, 2 to 2½ feet, 30s. per 100; 3½ to 4 feet, 40s. do.; Picea nobilis, 1½ to 2 feet, 6s. per 100; P. Nordmannia, 2½ feet, 18s. do.; 3 to 3½ feet, 24s. do.; Retinospora plumosa, 2½ feet, 30s. per 100; 3 to 4 feet, 60s. do.; R. squarrosa, 2½ feet, 30s. per 100; 3 to 3½ feet, 60s. do.; Thuia, 1½ to 2 feet, 12s. per 100; 3 feet, 30s. do.; 4 to 5 feet, 50s. do.; 6 feet, 80s. do. Pine Thuiopsis dolabrata, 2 feet, 30s. per 100; 2½ feet to 3 feet, 70s. do.; 4 to 4½ feet, 30s. per dozen. The finest Specimens in England.

THE
Gardeners' Chronicle.
SATURDAY, DECEMBER 3, 1892.

RHODODENDRONS.*
RHODODENDRONS have held a prominent position among popular garden plants for nearly a hundred years. To-day they rank next to the Rose among plants which are cultivated for their flowers. The history of Rhododendrons, which is one of peculiar interest, is scattered through all kinds of books and papers, both botanical and horticultural, and it is therefore not easy for anyone to obtain a good general idea of the genus as a whole. For this reason I have made my paper chiefly historical.

Rhododendron is the second largest genus in the Heath family, Erica itself being first with a total of something like four hundred species. But whilst we may reasonably assume that the extent of the latter genus is already known, there are good reasons for believing that the Rhododendrons will eventually surpass the Heaths in point of numbers. In 1764 Linnæus knew only five species. In 1839 the number known had increased to thirty-two species; and in 1875, according to Hooker, in the *Genera Plantarum*, the recognised species numbered one hundred and thirty. Writing in November, 1890, Sir Joseph Hooker stated that "judging by recent botanical explorations, the genus will probably exceed in the number of its species all previous estimates, the discoveries made in the eastern Himalaya being only harbingers of what the vast mountain regions further east may be expected to yield in new forms of Rhododendrons. The genus which is represented in western Europe by three species only, with two additional in the southern Caucasus, develops remarkably in the Himalaya region eastward. Considering how imperfectly that great and lofty region has been explored, it may safely be assumed that not half of the Rhododendrons peculiar to India have yet been discovered. In the western mountains of China between sixty and seventy species of Rhododendron have already been collected, although only fragmentary explorations have yet been made. It is, therefore, not impossible that the Chinese Empire may contain more species of this genus than all the rest of the world besides."

The distribution of the known species is as follows:—

Europe	3 species
India (British)	46 "
China and Japan	65 "
Malay and New Guinea	27 "
Rest of Asia	6 "
America, North	15 "
This gives a total of 162.	

* A paper read before the New Gardeners' Society, by W. Watson, Assistant Curator.

There are no Rhododendrons in Australia, none in Africa, none in South America. The plants known as Andean Rhododendrons are Befarias. They get near to the Australian continent in New Guinea, where several very beautiful species have been discovered at high altitudes. So far, however, not one of these has been introduced.

The limits of the genus in regard to temperature appear to be the cold of Lapland on the one hand, and an intermediate temperature on the other. Although plentiful on the mountains of tropical countries, not one descends to really tropical climes.

The genus, as it is now constituted, includes the hardy deciduous Azaleas and the greenhouse Azaleas, commonly known as Indian Azaleas. It is generally believed that the sinking of Azalea under Rhododendron is a recent botanical fad, but, as a matter of fact, it was proposed by Salisbury nearly ninety years ago. He wrote in 1805:—"To the genus Rhododendron I have no hesitation in referring all the Azaleas of other authors. They agree minutely in habit, inflorescence, filaments, anthers, pollen, fruit, and seeds. Mere number of stamens appear to be of no consequence whatever. The deciduous and evergreen species cross freely with each other, hybrids from the two being now in the nursery of Mr. Thompson at Mile End."

The authors of the *Genera Plantarum* divided the genus into nine sections, grouping under Azalea (section iv.) the deciduous hardy species represented by *R. sinense* and *R. ponticum*. The greenhouse Azaleas were placed under *Tsusia* (section v.).

The names as they stand in gardens, albeit a little inconvenient, will probably continue to satisfy the requirements of horticulturists, who now call the evergreens of the genus Rhododendron, except the greenhouse Azaleas, employing this latter name for the hardy deciduous species as well.

Turning now to the salient features of the genus, we first note a fact of some importance to horticulturists, namely, that scarcely one of the many species known is wanting in that kind of interest which we all look for in a garden plant. From the largest to the smallest in stature, in leaf and in flower, they are all eminently plants for the garden. Another commendable character of Rhododendrons is that of general good behaviour under cultivation. There are a few species, chiefly alpine, which are not always happy in low-lying gardens, and some are a little fastidious in regard to soil.

In stature the species vary from a height of about 50 feet, and a trunk 16 feet in girth, to the smallest tuft-like shrubs, only a few inches high. The leaves are extremely variable in size, the largest being those of *R. Falconeri*, which, according to Hooker, are sometimes 19 inches long by 8 inches wide; the smallest, *R. parvifolium*, *R. ericoides*, and *R. buxifolium*, the leaf dimensions of which are denoted by their names. The flowers vary as much as the leaves; *R. Griffithii* (Aucklandii) having beautiful white saucer-shaped flowers, 6 inches across, and *R. Nuttallii*, a large creamy-white bell, 5 inches deep and wide. In *R. glaucum* they are as small as the flowers of *Kalmias*, whilst in the small alpine species, such as *R. setosum* and *R. nivale*, they are less than a quarter of an inch wide. The arrangement of the flowers varies from a dense conical head, as in *R. arboreum*, to a loose umbel, or to solitary axillary bells. The attribute of fragrance is not uncommon in the Himalayan species, whilst it is general in the hardy Azaleas of North America. By cross-breeding, however, this desirable character has been made much more common, many of the hardy garden Rhododendrons possessing a decided and pleasing odour. The colours of the flowers range from the purest white to rose, red, crimson-purple, yellow, orange, in fact, every shade except pure blue.

There is very little variety in the seeds. The plants produce them freely under cultivation, and it is to this fact that we owe the rich variety and

improvement generally made in the genus by cultivators. Unless the seeds are required, it is advisable to remove the remains of the inflorescence as soon as the flowers have faded, the production of a crop of seeds being a waste of energy, which often affects the health of the plant.

So far as is known, the deciduous species are natives of northern regions, namely, North America and northern Asia, including China and Japan. The whole of those found in the Himalaya and the Malay Archipelago are evergreen. It is remarkable that a solitary deciduous species, *R. flavum*, the Pontic Azalea, should be found in Asia Minor, and another, *R. sinense*, in China, all the other deciduous species being natives of North America. *W. W.*

(To be continued.)

NEW OR NOTEWORTHY PLANTS.

DENDROBIUM PHALLENOPSIS, FITZGER. VAR. ROTHSCHILDIANA.*

This is one of the best and the most distinct varieties of this noble plant; we may regard it as a counterpart to the *Statterianum* variety (*v. Reichenbachia*, ser. ii., vol. i., pl. F.). The flowers are fully 4 inches broad, and nearly 3½ inches in height. The colour is snowy-white, with the most tender blush of pink you can imagine; the side lobes of the lip are light pink, with some deeper-coloured lines on the disk. From the merely botanical point of view, this variety is well distinguished by the slender form of the directly lanceolate sepals. The rhomboidal petals and the compressed and by no means semi-globular spur ("subhæmispæricum," in Mr. Fitzgerald's description). The column is broader than in the type and in other varieties, and shown from the front it is directly rhomboid; but, as we find in the variety "*Statterianum*," already an upwards enlarged column, it is quite impossible to regard this somewhat more enlarged column as a character of specific value. The plant flowered in Lord Rothschild's collection at Tring Park. *Dr. F. Kraenzlin*.

FOREIGN CORRESPONDENCE.

THE CHICAGO EXHIBITION.

AFTER a good many changes, and some disappointing postponements, the great dedication of the World's Fair took place on Friday, October 21. A great many plants were used to decorate the great Manufactures Building, but their effect was lost in the vast space, excepting to those who were seated on or near the platform. Perhaps the most conspicuous feature in the decoration was the hedge of *Salvia splendens* in front of the large Palms and other tall foliage plants which formed the stage setting. One of the most beautiful plants in the grouping was a fine *Livistona rotundifolia* from a private Philadelphia collection. A variety of *Chrysanthemum* plants were used around the galleries and in other parts of the hall. The luncheon tables were decorated with plants of *Grevillea robusta* and *Madame Crozy Cannas*, while a charming arrangement of Pansies, bordered with the bronzy leaves of the Scrub Oak, formed a tracery over the cloth.

So far the largest individual exhibit comes from the state of Pennsylvania; it comprises the largest number of valuable plants yet received. The Washington Botanic Garden has sent a fine lot,

* *Dendrobium Phalænopsis* Fitzger. var. *Rothschildiana*.—Sepalo dorsali oblongo-lanceolato acuto, lateralibus ovato-oblongis basi antice in mentum obtuse concavum postice in pseudocaular. rectum compressum apice obtusum coalitis; petalis rhombæis antice obtusatis apiculatisque quarta longioribus triplo latioribus quam sepala; labelli lobis lateralibus obovatis antice rotundatis convolutis; lobo intermedio minore asquialongo oblongo mento; disco in fundo lucis 5 rugosis (intermedio minore) instructo; gynostemii pedic. bilamellato; gynostemio ipsobrevi a tace energie dilatato a fronte viso fere rhombeo dorso carinato; anthera minuta; fovea stigmatica max. un. Totus floris ½ poll. altus tere 4 pollic. latus candidus; labellum (preærtum lobi laterales) tenerrime roseo suffusum.

including many rare or little-known plants. *Euphorbia grandidens* is among these; we are supposed to possess but three specimens of this curious *Euphorbia* in America. The Agaves, Fourcroyas, and Cacti from Washington will be used in the projected Arizona garden. So far, very few Orchids have been received, excepting a quantity of freshly-collected plants from the Guatemalan government; there are few varieties of value among them, nor are they likely to become sufficiently established to be of great interest by next year.

The Bureau of Floriculture is often embarrassed by the tender of plants that are really of no value, and of no cultural merit. When these useless specimens are sent some distance unpaid, they provoke exasperation.

One of the horticultural difficulties at the World's Fair is the extremely poor soil of Jackson Park. For the most part it is simply fine lake sand, with a thin covering of black humus on the top; it is too poor for the most unexacting plants, without a great deal of fertilising. Yet, in spite of its poverty, it is an abominably sticky compound in wet weather, and the roads call for a great deal of work before they will be fit for walking in comfort.

The display of *Chrysanthemums* is very good at time of writing. It is confidently asserted that American taste is reverting to the regular globular incurved sorts, instead of the widely irregular types recently in favour, and some good examples of Mrs. L. C. Madeira, a clear yellow; and Mrs. Robert Craig, creamy-white, show the coming form. Mr. Thorpe has a number of *Chrysanthemums* raised from European seed (seedsmen's stock), but the plants are invariably weedy, showing very little promise. The finest crimson among Mr. Thorpe's plants is G. W. Childs, which holds the highest rank among American growers, while among yellows, H. E. Widener and W. H. Lincoln keep high rank. Preparations are being made for an unusual display of *Chrysanthemums* at Jackson Park next year. Arrangement is rapidly progressing in the main horticultural building, with the intention of opening it to the public as a winter garden next month. *E. L. T. Chicago, U.S.A.*

NOTES FROM GERMANY.

Speaking of novelties in general, English horticulturists are, as we continental people admit, to the fore in the profession, but as far as regards trees and shrubs for the open air, some pre-eminence may reasonably be claimed for a few of our own countrymen. In perusing the catalogues (1892-93) of Dr. Dieck, National Arboretum at Zöschen, and of Mr. L. Späth, Rixdorf, Berlin, two eminent promoters of German dendrology, we meet with a considerable number of species and varieties new to cultivation, and either directly introduced from their native country, or raised in their establishments by these two gentlemen. The readers of the *Gardeners' Chronicle* will, perhaps, remember the report of the National Arboretum at Zöschen given two years ago by the writer of these lines; whilst a very detailed account of Mr. Späth's nurseries was published in this journal some time ago. Beginning with Dr. Dieck's novelties, the following are, perhaps, the most interesting:—

Acer pictum, Tbg., var. *Mono*.—Professor Dippel classes *A. mono* and *pictum* as the same species, but the forms received from Yezo under these two names show sufficient difference to claim, at least for *A. mono* the distinction of being a distinct variety. Evidently, the many forms of *A. pictum* are quite as characteristic of eastern Asia as those of *A. saccharinum* of eastern North America.

A. Trautvetteri, Medwed.—There is good reason to doubt if this Caucasian species is identical with *A. insigne*, Boiss., and it may be preferable to consider it as a distinct variety, which also is easily confounded with the common *Sycamore*.

A. Trautvetteri, Medw., var. *erythrocarpa*.—A variety from the same locality, distinguished by the splendid red colour of its seed wings, which renders the tree in autumn particularly beautiful.

A. ussuriensis, Dipp., n. sp.—In Dr. Dieck's

last catalogue we meet with this Alder under the name of *A. rhombifolia*, Nutt., a Columbian species. Since then Professor Dippel has described it as *A. occidentalis*. A very beautiful tree, of fast growth, true from seed.

Andromeda japonica, Thunb., v. *foliis albo-variegatis*, Fr. et Sav.—A most charming and elegant variety.

Calyptristigma (*Diervilla*) *Miädendorfsiana*, Trautv. et Mey.—The flowers, of a sulphur-yellow colour, look like those of a Gloxinia. They are very beautiful, and far superior to those of other *Diervilla*s. The plant requires a somewhat peaty soil.

Chiogenes hispidula, T. et Gr.—This nice little plant, with a creeping habit and white berries, was collected in the marshy woods of Michigan, and is liable to be mistaken for an *Oxycoccus*.

Colutea melanocalyx, Boiss.—Seeds of this very quick-growing species were received from Smyrna and the Pontus, and we may here remark that young plants formed in one year pretty shrubs, flowering abundantly.

Cytisus Schipkaënsis, Dieck.—A low-growing plant, scarcely 1 foot high, with pure white flowers. Discovered at the summit of the Shipka Pass, where *Syringa vulgaris* and *Prunus Lauro-cerasus* also abound.

Diervilla florida, S. et Z.—Seeds from eastern Asia produced plants, which in almost every respect differ from all known forms of the above-mentioned species.

Fraxinus elonza, Dipp.—This Ash resembles equally *F. tamariscifolia* and *F. angustifolia*, and is said to come from Italy.

Gordonia lasianthus, L.—A Ternstroemiaceous genus not yet represented, as it seems, in the parks of Europe. Growing in the Alleghanias, this species will prove hardy, even in the German climate.

Magnolia Fraseri, Walt. (*auriculata*), Lam.—Erroneously, the name of this interesting species is often to be met with in catalogues, but almost in all cases we have to do with one form or other of the Japanese *M. obovata*. The high regions of the Alleghanias are the home of *M. Fraseri*, which in its flowers resembles *M. glauca*, but is much hardier, and less particular as to soil and locality.

Polygonum Baldschuanicum, Rgl.—A most luxuriously-growing and very ornamental woody climber from eastern South Turkestan.

Prunus armeniaca, L., *spontanea*.—As the spontaneous form of *P. armeniaca*, Dr. Dieck only knows a forest shrub of south-western Russia, especially of Bessarabia, which shows the short-pointed leaf of our cultivated Apricots. (The original country of the Apricot extends, according to A. De Candolle, in his *Origine des Plantes Cultivées*, from north-western India to China; in other parts of Asia only naturalised forms of it can be found.)

Prunus Pseudo-Cerasus, Lindl., *spontanea*.—Of the Sakura of Japan, we have had, up to the present time, only the cultivated forms, and Dr. Dieck now offers plants of the typical form, distinguished by larger leaves.

Prunus Salzeri, Zdarek.—Belonging to the Padus group, with a yellowish-white fruit, and said to be true from seed. Discovered three years ago in Carinthia and Styria.

Pterostyrax corymbosum, S. et K.—The *Ovateya* of Japan, a mountainous plant; whilst the other species, *P. hispidum*, the *Asagara*, introduced a good while ago, grows in the plains.

Quercus alnifolia, Poeck.—This Oak, remarkable for its distinctness and beauty, is probably a survivor from a long past period; it has a very restricted habitat, the Troodos Mountains of Cyprus. The variation of the foliage is almost unlimited, but a form with leaves like a *Camellia* prevails. The old leaves are commonly covered underneath with a splendid golden pubescence. Dr. Dieck owes this interesting introduction to the present Governor of Cyprus, and in the introductory remarks of his catalogue he fully recognises the valuable services Lord Lytton has rendered to botanical enterprise.

Quercus macedonica, A. DC.—A magnificent Oak of the *Cerris* group, bearing large edible acorns.

Robinia Neo-Mexicana, Gray, var. *luxurians*, Dieck.—This beautiful form inhabits the Colorado Plateau and the Southern Rocky Mountains. The typical form has a dwarfish habit. This variety grows much higher, and its racemes are mostly branched. In

FIG. 102.—CHRYSANTHEMUM CARINATUM, FLORE PLENO. (SEE P. 670.)

Zöschchen it flowered twice a year, first in June, and then in August on the youngest branchlets.

Rosa glutinosa, Sieb. et Sm., var. *Yarmalensis*, Dieck.—A very neat, small-leaved variety, from the mountains of Smyrna, where at a height of 1950 to 2294 feet it grows in very rich soil. This shrub, not

FIG. 103.—LOBELIA ERINUS GOLDFELSE. (SEE P. 670.)

much higher than 2½ feet, is characterised by its strong uncinatè spines, very similar to those of *Rosa Serafini*. Its comparatively large flowers are of a whitish-red colour. A valuable acquisition for the rock garden.

Salix Hoyeriana, Dieck.—Lieutenant Hoyer, Dr. Dieck's collector in British Columbia, discovered this highly-interesting Willow in the higher mountain regions. It evidently represents an American

parallel to the Siberian *Salix pyrolæfolia* (*sabulosa*, Turcz.). Its chief peculiarities are that the plant lies quite close on the ground, just as if bent down. The leaves are roundish-oval, short pointed, and light green.

Zelkova japonica, Dipp., var. *Verschaaffelti*, Dipp.—In Belgian catalogues this elegant tree of small size appears as *Ulmus Verschaaffelti*, and Dr. Dieck formerly announced it to be *Planera japonica*.

Besides these briefly-mentioned novelties, the Zöschchen catalogue contains a great many more, but for English readers we think we have made a sufficient selection.

Coming now to Mr. Späth's new acquisitions, the following deserve special notice:—

Acer hybridum.—Of this very interesting Baatar Maple, seldom to be met with in commerce, Professor Dippel rediscovered an old medium-sized tree with a compact roundish crown. The dense and dark green foliage is somewhat peculiar.

Acer truncatum, Il. bot. Berol.—Seeds from China produced a good many young plants. Flowers and fruit are still unknown, but there are good reasons to believe that they belong either to Bunge's species of the above name, or are closely related to *A. pictum*, Thbg. The tree has dense light green foliage, and is of vigorous growth. Leaves, long, petiolate, glabrous, five-lobed; lobes acuminate; margin irregularly undulate and crispate, with a few small or larger teeth.

Fagus sylvatica fol. striatis, Bose.—This beautiful Beech was discovered many years ago in a forest of Hlesia. Soon after opening, the leaves show a quite regular golden striation, parallel with the nerve, and this striking appearance lasts till the leaves fall off in autumn. Thanks to the efforts of Professor Dippel, this long-known tree has now been introduced in our gardens.

Fagus sylvatica Zlatia, Späth.—The golden Beech of Servia was discovered by Professor Dragaschevitch in the mountainous district of that country, and probably originated from seeds. A splendid ornament for our parks is this fine tree, with a circumference of some 5 feet, and very dense foliage; it will take a prominent place amongst the green-leaved varieties. The native name is "Zladna bukwa," that is Golden Beech; and to mark his delight in meeting with such a magnificent tree, Professor Dragaschevitch has named it *Zlatia*, a playful expression, meaning the golden-haired sweetheart.

Ilex decidua, Wald. (*Prinos decidua*, De C.).—Mr. Späth obtained this deciduous Holly from seed, which were received from the Arnold Arboretum.

Populus euphratica, Oliv.—Some ten years ago, Mr. Koopman sent young plants of this species from Turkestan. At first they grew well, especially one specimen in the Horticultural school at Potsdam; but by some accident or other, they were all lost. Mr. Späth has now succeeded in getting another lot, and so we may hope that this tree, with such an interesting history, will become established in our gardens. Modern commentators prove this to be the Scriptural "Willow," upon which the Jews hanged their harps, since *Salix babylonica* has not been seen growing by the streams of Babylon. The diversity in the foliage of this remarkable tree is most striking; one would describe it as a Poplar with Willow leaves, in looking at the young trees, which at first only show the small glaucous foliage of the purple Willow. But this is only one extreme of the variable foliage, which assumes many forms, until it finally puts out the large kidney-shaped leaf of the *Cercis*. In its native habitat, the sand-steppes or the vicinity of streams, this species shows a great indifference to the nature of the soil.

Salix blanda, Anders.—According to Professor Dippel, the broad-leaved Weeping Willow was discovered in the vicinity of Hanau. Some botanists consider it a cross between *S. babylonica* and *S. fragilis*. The branches and twigs are elegantly arching, and covered with leaves similar to those of *S. babylonica*, but much longer and larger.

Sorbus alnifolia, Wennig.—Described and figured

in the *Gartenflora*, 1892, p. 282. The introduction of this small tree is due to Dr. Nagai, of Japan, and it will certainly be appreciated as a good acquisition for our shrubberies.

In conclusion may we be allowed to say a few words in reference to the German Dendrological Society, which has just issued its first circular. There is no doubt that dendrology becomes more and more acknowledged as a branch of systematic botany; the works of the late Professor C. Koch, and of the late, Mr. W. Lauche, have done much in this way, and the more recent publications of Professor Dippel and of Mr. L. Beissner, the latter especially on Coniferous plants, will be welcomed by all interested in this matter. The new society proposes to popularise this science, a journal is to be founded, meetings will be held regularly, and the names of the gentlemen at the head of this new enterprise give us the best guarantee that it will be no vain one, and that gardeners and amateurs alike will profit much by it. *Dr. Edmund Goetze, Botanic Garden, Greifswald.*

CONTINENTAL NOVELTIES.

MR. LORENZ, of Erfurt, sends us illustrations of novelties to be sent out by him during the present season.

CHRYSANTHEMUM CARINATUM (fig. 102).—The varieties selected are commended on account of the perfect double condition and brilliant colouring of the flowers, which ranges from white to yellow, red, and purple.

LOBELIA ERINUS, "Goldelse" (fig. 103).—A compact variety with golden-yellow foliage.

MIGNONETTE, LORENZ'S IMPROVED *VICTORIA* (fig. 104).—The height is said not to exceed 6 inches, and the reddish flowers larger than those of the old *Victoria Mignonette*.

CHRYSANTHEMUM CUTTINGS.

WHEN the cuttings should be inserted, in order that they may produce the finest plants and blooms, is a question upon which cultivators differ somewhat. The common-sense view of the matter seems to point to the conclusion, that to give a plant a long season of steady growth is a decided advantage. It is admitted generally that *Chrysanthemums* abhor heat in all stages of their growth. When early propagation is practised, there is ample time for a steady growth in a cool temperature; it has the best possible chance of becoming solid through the proper maturation of the tissues of the plants, and without maturation the best results cannot be secured, especially in the case of the incurved section, where solidity of the blooms is most essential. Plants that have extra strong gross leaves and stems, quite green and soft to the touch in September, never produce blooms of high quality; they may be large in diameter, but they lack depth and solidity.

In the case of growers residing in the northern counties, late propagation is a decided disadvantage; the wood of late-struck plants never ripens thoroughly. Early propagation there, for the reasons stated above, is most essential for plants intended to produce large blooms, whether for exhibition or home use, and for specimen trained plants, where quantity as well as quality has to be considered. I do not, however, say that the cuttings must be inserted on any particular day or week, because I know such a hard-and-fast rule is not practicable; indeed, the cuttings of some varieties cannot be procured when required. In the case of bush plants, where quantity rather than quality is the first consideration, the cuttings need not be inserted so early. The end of January will be a good time for this section. In the two former instances, the month of December is a good time; but if longer deferred, much valuable space, which could be better occupied, has to be taken up for storing the old stools. A commencement should be made with the weak-growing sorts, such as *Lady*

Hardinge and *Princess Beatrice*, for example, and the weaker-growing sorts of Japanese.

The best cuttings are those taken some distance from the stem of the old plant, and about 3 inches long. Such cuttings are termed suckers; why they are best is, that coming from a distance away from the old stem, they are more likely to make clean growth, and less likely to form premature bloom-buds, which causes a check to the plant every time this takes place, and the fewer checks a *Chrysanthemum* plant receives from the time the cuttings are inserted until the blooms are produced the better.

Some attention should be paid to the cutting itself; avoid those which have bloom-buds at their apex, for these are of little use, and are certain to stop growing very early after they have been inserted. The cuttings should be cut square across below a joint; remove the lower pair of leaves. The kind of soil which some persons employ to strike the cuttings in is not of the best; they appear to think that anything will suffice, and very often use nothing but the refuse soil from old plants of *Chrysanthemums* which have been highly fed—the consequence is, that the soil is soured, and not at all good for the production of new and tender roots, especially when the sorts are of weakly growth.

None but new soil should be employed; there is nothing better than equal parts of loam, leaf-mould, and sharp silver-sand, well mixed together, and passed through a half-inch sieve. With a view of economising time and space, some persons insert two, three, and sometimes four, cuttings around the edge of a 3-inch pot. There is no reason why they will not strike quite as readily in this manner as any other, but there is another and a great objection to the plan—that of giving a check to the plants when dividing them for transferring to single pots, as they eventually must be. Single pots, 2½ inches in diameter, are much the best; these should be long and narrow, as the roots strike directly downwards, and a larger number of such pots can be arranged in a given space than others of the same capacity, wider, but not so deep. The pots should be perfectly clean, for in turning plants out of dirty pots, the roots cling so tenaciously to their sides, that many of them are broken in the action of removing them. If clean pots have been used, the plants are shifted with their roots intact, and experience not the slightest check from the operation. One crock is sufficient drainage for each pot, and it should be covered with a little rough decomposed leaf-soil; or, what is handier, the rougher portions taken from the compost by passing it through a fine sieve. Fill the pots firmly with the soil, and on the top sprinkle a little sand, to be carried down to the bottom of the hole with the dibbler for the cuttings to rest on. The soil should be pressed firmly about the cutting, particularly its base, and a gentle watering given through a fine rose waterpot to settle the compost.

The best position to strike the cuttings in is the next consideration. Some advocate bottom heat, but this is neither necessary nor advisable, the application of heat at this stage tending to weaken the cuttings. A sturdy growth is desirable, and bottom heat is not the best means of securing it. Some prefer a cold frame, but, although frost will not kill the cuttings, while they are in such condition, for perhaps a fortnight or more, they are not making roots, and much valuable time is lost. If they are protected from frost by an outside covering, which at times must be left on many days, the leaves are liable to damp. The best method is to put them under handlights, or in a propagating frame placed in a house having a temperature of from 40° to 50°. It matters little whether it be a vinery, Peach-house, or greenhouse, so long as the cuttings are fairly near to the glass, and of the temperature named. If the lights are placed on a lattice stage, means must be taken to make the bottom air-tight; first cover the stage with slates, and then a layer of coal ashes, for securing a cool moist foundation. The lights must be kept closed until roots are formed, except during an hour in the morning to dispel excessive moisture, and in the evening the inside of the glass should be wiped dry with a sponge. All these may appear

trifling details, but the small percentage of losses through cuttings damping will be the best proof of the wisdom of such treatment. Shading, as a rule, will not be required, unless the position is a very sunny one, but if the leaves show a tendency to flag they must be shaded. In a month many of the cuttings will be rooted, the strongest growing varieties especially so. A little air should then be given by tilting the lights a little on one side, and increasing the ventilation until they can be safely removed. While some need air, the leaves of others will flag, some varieties requiring more time to root than others. These should be removed to a frame by themselves, where they can be kept closer than those which do not flag, and that require more air to retain that stocky growth which is indispensable. Through keeping the frames closed but little water is required during the rooting process, yet the soil must be kept moist for the support of the cuttings or plants.

When the cuttings are well rooted, and the roots are running on the outside of the soil, they should be removed from the frame to a position nearer the glass. Where a permanent shelf is not at hand, a temporary one can easily be made by suspending a 9-inch wide thin board to the rafters by means of screws and wire. If a groove is made on both sides of the upper surface of the shelf it will act as a conductor to run the water off to one end, which can easily be done by allowing a slight slope in fixing the shelf. Any plants standing under the *Chrysanthemums* are not then splashed by the water given to the plants overhead. *E. Molyneux.*

OUVIRANDRA FENESTRALIS (THE LATTICE-LEAF PLANT).

WITHOUT doubt, this is the most beautiful of all submerged aquatic plants under cultivation. More especially does this apply to plants that are in a flourishing condition, and where graceful and delicate leaves are considered as the standard of perfection. The peculiar leaves are unique, though some plants have perforated leaves, as *Monstera deliciosa*; but these openings are only scattered here and there over the surface, while in the plant in question we have numerous small openings of great regularity, seeming to obliterate the whole of the cellular tissue. In examining a number of young leaves, it is found that many of the openings which are present when the leaves have attained their full size, are closed and filled with parenchymatous tissue in early stages of their growth. One naturally enquires what part these numerous openings play in the economy of the plant. It may, perhaps, be for the purpose of allowing the light to reach those leaves which are not so much favoured as those near to the surface of the water, an element of which they would get but little of, if it were not for these openings, as the leaves are spread out horizontally.

It is not in every establishment where this plant is grown that it can be said to thrive; the finest specimens that I have had the pleasure of seeing were those in the Edinburgh Botanic Gardens, and those of Chatsworth, though I make no doubt that there are many places where it is equally as well-grown as in the above-mentioned gardens. In the Sheffield gardens we have some thriving specimens with leaves 16½ inches in length, and 4 inches broad.

Those who are desirous of cultivating this interesting plant should procure a vessel some 2½ feet in diameter, or upwards, and about 18 inches in depth; a wooden tub answers the purpose admirably, and in which they appear to thrive better than in any other of different material. It must be placed in a house which is kept at a stove temperature, with a minimum of 60° to 65°, and may stand upon the floor of the house or stage, shading slightly from the sun during the brightest part of the summer. It is also important that the water in which it is grown be kept at a minimum temperature of 60° as near as can be, the maximum should not exceed 75°. Perhaps the most important item of all is a good supply of soft water, and where the natural supply is not of this character, rain water only should be secured and

used, as in water which contains much sulphate of lime this plant cannot flourish, but grows less and less, eventually dying outright. The leaves of the plant require to be kept clean, and this end is secured under natural conditions by the plant growing in shallow water in running streams. Out of many plans that I have tried for keeping the water in motion, and so preventing the confervæ from becoming attached to the leaves, none have succeeded better than having a small vessel of water placed several feet above the tub in which the specimen is growing, and to which a small tap is fixed, which is regulated so as to let out a continual dropping into the tub of some forty or fifty drops per minute. This, with a syringing overhead two or three times a day, and the plant occasionally gone over with a painter's ordinary sash tool, will be found sufficient to keep it in a very cleanly condition. *Ouvirandra fenestralis* is the species which is in general cultivation, the leaves of which are oblong in form, very rarely exceeding 1 foot in length, and 3 inches in breadth, with an obtuse apex; but there is a form of this species (or so it appears to me) with larger leaves, broadest towards the extremity, and with a retuse much indented apex. Mr. Thomas, of the Royal Gardens, Frogmore, writing to me from Chatsworth respecting this plant, says that an interesting point concerning it is that it does not flower, while *O. fenestralis* flowers, and propagates itself readily from seed, which fact I am able to endorse. At Chatsworth this non-flowering species is grown under the name of *O. Berneriana*, but it is impossible for it to be that species, as the leaves of this plant are much longer and narrower than even those of *O. fenestralis*, and the meshes closer together. *O. Berneriana* is a plant I have never seen in cultivation, but only as dried specimens. I enclose you a photograph of *O. fenestralis*, and the varietal form which I propose calling *retusa*. A friend of mine sent me a specimen some time ago of *O. fenestralis* bearing two leaves upon one stalk, spreading out horizontally, with the inner margins slightly overlapping; while I gathered a specimen of a double leaf from a plant of *O. fenestralis* var. *retusa*, in which one leaf lies upon the other in a superimposed condition.

O. fenestralis var. *retusa* bears very handsome foliage, and in appearance is preferable to the species. It is a native of Madagascar. The natives collect its fleshy farinaceous roots as an article of food, calling the plant, on this account, *Ouvirandra*, which means literally Water Yam, and this is the source of the generic name. *W. Harrow, Botanical and Horticultural Society's Gardens, Sheffield.*

THE ROSERY.

NEW ROSES OF 1891-92.

THE standard of Roses is so high now, that a new Rose, to be of any special merit, must indeed be a good one; or at any rate, something quite distinct from existing kinds. New Roses are readily secured in quantity, but really "decided acquisitions" are rare. It is my object to point out the few best; and, although I have not grown and flowered all of these, I have a large number of them, and have seen fair examples of the remainder. In the majority of cases, the raiser's description is far too glowing. It would seem that they know old growers will discount their descriptions considerably, and so they put them higher than ever in order to catch old as well as new growers. I am alluding more particularly to the French and German growers as a body. Our home raisers generally give a fair description when one remembers they are praising their own productions and pets.

Marchioness of Dufferin (A. Dickson & Son) is a very large Rose, of fairly good shape, having reflexed petals, with a very slight shade of yellow at their base. The main colour of the flower is a beautiful rosy-pink. A good grower.

Margaret Dickson (A. Dickson & Son) is one of

the best and most distinct Roses sent out. The petals are pure white, except for a very pale flesh centre. It is somewhat after the form of Baroness Rothschild and Merveille de Lyon, but is fuller than either, and a much purer white than the latter.

Jeannie Dickson (A. Dickson & Son) is one of our grandest cupped Roses; the petals are large, the flower well built up, and with a high centre. Colour, a bright rosy-pink; very pleasing, and an exceedingly free bloomer.

Mrs. William Watson (A. Dickson & Son) is pale pink, with a silvery back to the petals. I understand it to be a cross between Madame Vidot and Merveille de Lyon, and it has every appearance of being a true cross between these two.

T. W. Girdlestone (A. Dickson & Son) is thoroughly distinct, and may be described as a brilliant red, with a slight shading of lake at the base of the petals. It is a good grower, good shape, and very sweet-scented.

This firm, Messrs. A. Dickson & Son, of Newtownards, Ireland, has sent out some grand Roses of late. Among them I may mention Mrs. J. Wilson, Ethel Brownlow, Lady Helen Stewart, Lady Arthur Hill, Caroline d'Arden, and Earl of Dufferin. They also raised Mrs. W. G. Grant, the Gold Medal Rose of 1892. This is really a grand Rose, but is unfor-

FIG. 101.—MIGNONETTE, LORENZ'S IMPROVED VICTORIA. (SEE P. 670.)

unately, sold to an American firm, so that I am afraid we shall not see it again until 1894 or 1895. However, Messrs. Dickson have several more grand Roses in hand, some of which were shown as "seedlings" among the new Roses at Chester. I also hear a grand account of Marchioness of Londonderry.

Elise Fugier (Bonnaire) is a good button-hole Rose, having long-pointed buds in the way of *Niphotos*, but of a pale lemon colour.

Souvenir de Madame Sabbyrolles (Bonnaire) is another acquisition to the button-hole class. It is apricot, pink, and yellow, suffused into one another, and is more full than the former variety.

Caroline Testout (Pernet & Ducher) has pleased me very much, and may be briefly described as a salmon La France. It is very pretty, and makes a grand pot Rose.

Danmark (Zeiner-Lassen & Dithmer) is a little too much like La France as far as the bloom is concerned. The growth, however, is distinct.

Gustave Regis (Pernet & Ducher) has long pointed buds of canary-yellow, with the deep apricot-tint towards the centre that is found in *Sunset*.

Pink Rover (Wm. Paul & Son) possesses the same delicate colour as the old Maiden's Blush, with a little deeper centre. It is large, full, and rather a flat flower.

Triomphe de Pernet, père (Pernet, p.) is an excellent grower, a free bloomer, and has a long pointed bud of bright red colour. It will make a grand garden Rose.

Crimson Queen (Wm. Paul & Son) is a fine

scarlet with velvety shadings, and forms a large globular flower.

Dowager Duchess of Marlborough (G. Paul & Son), pure silvery rose, good cupped form, very sweet, and a good grower.

Waban (E. M. Wood), a sport from Catherine Mermet; many shades deeper in colour—in fact, almost red; in other respects, it seems almost as good as C. Mermet, but I do not consider it so strong a grower. It may improve in this respect when the strain of excessive propagation is removed. The Bride has turned out a much stronger grower than was at first imagined, and I have the same hopes of Waban.

Medea (William Paul & Son), is a high-centred flower of globular form; lemon-yellow, with a deeper centre, a good grower, and very promising.

Mrs. Paul (G. Paul & Son) is one of the finest Bourbon Roses we have. The flower is large, and has thick petals, that are beautifully reflexed; colour blush-white, with a soft rosy-peach shading—a grand Rose, and thoroughly distinct.

Bruce Findlay (G. Paul & Son) is much like a China in its free and autumnal-blooming character; the flowers are bright crimson, large, and well-shaped.

Salamander (Wm. Paul & Son) changes its colour during the season, being deeper towards the end of the summer. It is a pure scarlet-crimson in the early part of the season. The flowers are well built, and of fine substance. It gained the National Rose Society's Gold Medal in 1890. Has very handsome foliage, and a vigorous constitution.

Christine de Nouë (Guillot), light purplish-red, with deeper shading—very sweet.

Spenser (Wm. Paul & Son) is one of our best new Roses; beautiful satiny-pink in colour, much deeper than Baroness Rothschild, and of somewhat similar growth. It is large and very full; quite distinct.

Climbing Perle des Jardins (Henderson) is a grand yellow climber. The flowers are similar to the normal variety, but the growth is much more vigorous, and it promises to become as great a favourite as *Maréchal Niel*. It has a distinct advantage of the latter variety, as it flowers in an equally perpetual manner as the old "Perle." Under glass, or for south walls, it is grand.

The following is a list of the best Roses brought out in 1889-90:—*Souvenir de Gomot*, Margaret Haywood, Marchioness of Lorne, Madame Renahy, Lady A. Hill, J. D. Pawle, Gustave Piganeau, Madame Carnot, La France of '89, Augustine Guinoisseau, *Souvenir de S. A. Prince*, Sappho, May Rivers, Kaiserin Friedrich, J. B. Varrone, and *Cleopatra*.

All of the Roses in this list are good, and distinct from older varieties.

The four best Roses that I know of, and that have yet to come out, are Mrs. W. G. Grant, Marchioness of Londonderry, Princess May, and Mrs. Harkness. *A. Piper.*

COLLECTING BRIAR STOCKS.

The present is a good time to collect stocks of the Dog-Rose for budding next July and August, and grafting this winter in heat. Select those with clean stems three-quarters of an inch in diameter, and that are not hide-bound. Trim them of side-shoots, and behead the roots somewhat, and after lopping the stock at various heights, plant them in rows 4 feet apart, and at 6 inches apart in the rows. After the planting is finished, drive a stoutish stake into the ground at each end of the row, with others (according to the length of the rows) between; then stretch some stout tarred string from stake to stake, and tie each Briar thereto; and finish off with a mulch 3 inches thick of leaf-mould or half-rotted dung. *H. W. Ward.* [Roses can be grafted on potted stocks put into mild heat at the new year, the grafts usually flowering in April and early May, when they may be stood amongst the greenhouse occupants to open and show off their blooms. The plants also flower a second time, about the time that their fellow stocks that were planted out are being budded.]

The graft is as secure as the bud, and quite a year is saved. In grafting, slip, whip, or wedge methods are adopted, and the end of the stock and at the scion are tipped, as well as the point of union, with grafting-wax, Homme le Fort. Eo.]

ORCHID NOTES AND GLEANINGS.

CATLEYA ALEXANDRE.

This remarkable *Cattleya* was described early in the present year (*Gardeners' Chronicle*, 1892, pt. i., p. 522) from a dried specimen, and living plants were introduced by Messrs. Linden, of Brussels. It is interesting to record that it has now flowered in more than one collection. A first flower expanded with Messrs. Linden on October 9, which was followed by one at Kew about a fortnight later. Others have appeared with Messrs. Linden, one of which was exhibited at a meeting of the Orchidæne, of Brussels, on November 13, and unanimously awarded a First-class Diploma of Honour. One of these flowers I have had the pleasure of seeing, and can say it confirms the indications of colour originally stated. The sepals and petals are both excessively undulated, in which respect they remind one of a *Schomburgkia*, and the colour is a light coppery-brown, recalling *Lælia grandis tenebrosa*. This flower, however, showed no shading off to violet on the margins. The lip is much like that of *Cattleya Leopoldii*, both in shape and colour, the front lobe being of a light rose-pink shade, and the acute side-lobes pale blush. The Kew flower had light green segments spotted with brown, though identical in other respects, thus indicating a certain amount of variability. Although not yet established, as is abundantly evident, it gives promise of being a great acquisition when fully established. The species has since also been introduced by Messrs. F. Sander & Co., of St. Albans. *R. A. R.*

ONCIDIUM SAINT LEGERIANUM.

This Orchid, which I discovered in Brazil, was brought to London last May, and some specimens were sold by Mr. Stevens to Mr. Sander, who grew them at St. Albans, and the plant was also shown to Mr. Rolfe, who recognised it as being new, and described it in the *Gardeners' Chronicle* on the 12th of last month. Mr. Sander showed the plant at the Royal Horticultural Society on November 1, where it attracted considerable attention. *Oncidium Saint Legerianum* is easy of cultivation. I discovered it in a district where the winter temperature falls to 2° and 4° C. below zero; and where, for six months of the year, it is covered with water, while for the rest of the year it is completely dry. The Indians fire the plains to raise pasturage for their animals. I was obliged to treat with the Indians before I could bring away the few specimens remaining, which unfortunately amounted only to about 3,500 in number. I transported these to Rio Janeiro, and there, under my care, they bloomed readily, one clump of seven or nine bulbs bearing forty to sixty flowers. Such an acquisition may supersede *Odotoglossums* as cut flowers, being of easy culture in a cool-house in Europe. There are four varieties of it known, and which render it acceptable both to professional and amateur horticulturists. It will surpass my *Oncidium Jonesianum* which I found in Central Paraguay, and which requires greater heat. *Cyrtopodium St. Legerianum*, which I also discovered, grows in the same latitude, as does *O. Jonesianum*; it flowers badly in Europe, because it has too much moisture. Its habitat is Upper Paraguay, on the frontier of Matto Grosso, Brazil, on the mountains and tree-tops; while *O. Jonesianum* comes from Central Paraguay, a warm dry climate, which cannot easily be imitated in European houses, where in the plants live only two or three years; *Oncidium St. Legerianum*, on the contrary, can endure both damp, drought, and coolness. My thanks are due to Mr. Rolfe for naming the Orchid after me, and to Mr. Sander

for growing, flowering, and showing it. *Vicomte de Saint Léger.*

LÆLIA ANCEPS "MORADA."

Under this name the Liverpool Horticultural Company, Garston, Liverpool, has for several years sold importations which, while producing the largest and richest-coloured forms in cultivation, have not contained any indifferent varieties. A delicately-beautiful flower is sent, of which Mr. Cowan says:—"It is very near the one sold by us some years ago, and which was afterwards named *L. a. Amesiana*." The flower has a labellum with the three raised orange-coloured keels down the centre, and the same rich violet-crimson front lobe as *L. a. Amesiana*, but the purplish-lilac tinging on the nearly-white sepals and petals is more pronounced than in that variety. It is a variety of great beauty, and the specimen is in the collection of W. Wells, Esq., Broomfield, Sale, near Manchester. *J. O'B.*

CYPRIPEDIUM ALBERTIANUM, J. Hyc.

A very fine hybrid obtained from *C. Spicerianum* × *C. insigne* Wallacei. Dorsal sepal very large, round, orbicular in form and prettily undulated, foundation white, two-thirds of the centre speckled with reddish-violet, the central vein of a deeper violet than are the spots or blotches in the centre, the remaining third of the border snow-white, the base of the sepal green, speckled with sepia. The lower sepal is greenish-white in the centre and base, the border and the tip are milk-white, slightly lined and spotted with clear violet. The petals are moderately long, horizontal, much undulated, at the base golden yellow almost covered with chestnut-brown; the tip of it and edges are fawn-coloured, the background and petals covered with many spots of clear sepia. The lip is very open, golden-chestnut above and bronze-green underneath as well as at the extremity, the interior is also much spotted. Staminode wavy round the edge, translucent in the centre, and round the column creamy-white, surmounted by a large patch of chrome-yellow. A very sturdy hybrid with fine foliage moderately long, deep green, much variegated with blackish-brown round the base of the leaves. Floral scape erect, sturdy, and black. A decided acquisition. The first flower opened on October 25, 1892. The hybrid was raised by the well-known amateur orchidist, M. Jules Hye, of Ghent.

FINE SPECIMEN OF RENANTHERA LOWI.

A plant with five racemes, 6½ feet long, is now blooming with M. R. Lemoine at Lille; four others of equal beauty have just finished blooming. I also saw a *Cyrtopodium Chamberlainianum*, bearing a small but very pretty bloom. *Ch. de B.*

DENDROBIUM MCCARTHERI.

This is "rather a slow grower, and requires considerable care, in order to keep it healthy. The temperature of its native habitat is said to be very equable, and to range between about 24° and 30° Centigrade (75° to 86° Fahrenheit), and throughout the year showers are sufficiently numerous to keep delicate Ferns quite fresh and growing, while during the rainy season, from May to about August, the rainfall is abundant. These circumstances indicate the conditions under which it must be cultivated; it should receive plenty of heat, light, and water. After its growths are finished, which is often rather late in the season, it should be removed to a somewhat cooler and drier situation, so that it may have a few weeks' rest. Care, however, must be taken to avoid letting the compost become too dry, so as to prevent the plant from shrivelling. Dr. Trimen, the present Director of the Botanic Garden at Peradeniya, states that this handsome Orchid is becoming very scarce, and will soon be extinct; but it is to be hoped that steps may be taken to prevent the occurrence of such a calamity. Ceylon has not a large number of handsome native Orchids, and the extermination of the best of them can surely be prevented if proper steps are taken before too late." *Lindonia*, November, 1892, p. 29.

THE WEEK'S WORK.

PLANTS UNDER GLASS.

By R. MILNER, Gardener, Penrice Castle, Swansea.

ADIANTUMS.—If these plants have been grown under cool treatment during the summer and autumn months, the fronds will now be in a hardy state, and will last much longer when used in a cut state than if grown in a high temperature. Plants which are at rest will require less water at the roots, and a high temperature at night should be avoided. For a supply of plants and fronds for decorative purposes during February and March, the required number of plants should be placed in a low warm structure. If possible, plunge the pots in a bed of cocoa-nut fibre, where a gentle bottom-heat is at command. Those plants should be selected which have been cut, and been kept rather dry for a few weeks. Such plants as these will quickly start away, and when the necessary growth has been obtained, remove them to a cooler house, to prepare them for the purposes for which they will be required. By starting a portion of the stock at intervals, according to the demand, a constant supply of plants is always at hand. Keep a sharp look-out for slugs, or they will soon damage the young growths.

CHRYSANTHEMUMS.—Before the time these lines are in print, the majority of these will be past their best, and should be cut down to within a few inches of the surface of the soil, and afterwards removed to pits or a cool Peach-house, safe from frost. Some varieties are very free in throwing up suckers or shoots from the base of the plant; in such cases these should be thinned out, so that those which are left may become stronger. The variety *Boule de Neige* is undoubtedly one of the best for late work, and when a quantity of bloom is required until the new year comes in, it should be grown freely.

BOUARDIAS.—The night temperature should range between 50° and 55°, with a corresponding rise by day. Keep the heads of the plants well up to the roof glass, admitting air on all favourable occasions for a few hours, to prevent the flowers being injured by damp. Succession plants should be thoroughly looked over before the flowers expand, and should any fly be detected, they must be thoroughly cleared off, for if allowed to make headway, they quickly disfigure the blooms.

TROPÆOLUM BALL OF FIRE.—From this time, and all through the winter months, this plant will continue to give quantities of its bright scarlet flowers, which at this season of the year cannot but be welcome. A good compost is three parts of fibrous loam, one of leaf soil, and a little sharp sand. Young plants which are occupying 5 and 6-inch pots, and are well-rooted, may be shifted into 10 or 12-inch, merely taking away the old drainage from the bottom of the ball. Give careful watering until the roots have entered the fresh compost. This plant is most useful for training up pillars, or for the rafters of a warm greenhouse or conservatory, allowing the young growths to hang about loosely, which tends to show off its scarlet coloured flowers to a better advantage.

THE HARDY FRUIT GARDEN.

By H. MARRHAM, Gardener, Mereworth Castle, Maidstone.

LIFTING FRUIT TREES.—This kind of work is best when finished off as soon as possible, although with care the work may be carried out at any time during the winter in mild weather; but the results from late lifting are seldom very satisfactory. The lifting of large trees, as was remarked in a previous calendar, to make sure of success, should be prepared during two years previous to removal. In commencing a job of tree lifting, take out a trench at 4 to 6 feet distant from the stem, and to a depth of 2 to 3 feet, and then by degrees dig down and undermine the mass of roots till they are exposed, then with a keen knife pare off such as have been damaged during the progress of the work, and relay the roots on a layer of good soil well trodden to a firm condition, and fill in above them with some of the same, and finally with the staple soil, compacting the soil as it is thrown in upon the roots a few shovelfuls at a time, and finish off with a mulch. This method is applicable to trees and bushes of all kinds, and when it is done at relatively short intervals, good results usually follow the operation. In some kinds

of soil a fruitful habit is soon engendered, and root-pruning in after years is rarely called for by trees that have begun to bear fruit abundantly and regularly, except when frosts in the spring have rendered the trees unfruitful for several seasons.

YOUNG STANDARD TREES.—Such of these as stand in orchards under turf should have the grass cut away round about the stems for a few years subsequent to being planted, and be liberally supplied with manure if the soil be poor; and if ground game abounds, some kind of protection must be placed round each tree, or the orchard effectually fenced in. There are various methods of protection in use, viz., galvanised-iron rabbit-netting, bundles of ash or hazel-rods strung together by means of a bit of wire at the top and bottom, and separated about an inch by means of little blocks of old Elder wood. This is a capital fence against rabbits, &c., and large stock. It should not be secured tight to the stem. Then there is a mixture with which the stems may be smeared up to a height of 6 feet, which consists of water, clay, soot, and cow-dung, or lime, together with half a pint of petroleum to a pailful. This kind of smear is also a good preventive of American blight and scale on Apple trees; or for these two last-mentioned foes of the gardener, soft-soap, train-oil, or petroleum may be used instead. If hay-bands have been made use of on any of the trees, burn them, as the larvæ of various kinds of mischievous insects find a hiding-place in them. If time permits, wash all trees with strong soapuds, mixed with a small quantity of petroleum, intimately mixed together whilst being used. Grease-bands, which I had never much faith in, are apparently giving way to the old and valuable remedy of dusting the trees with lime, and the free use of soapuds, &c.

THE KITCHEN GARDEN.

By G. WYBRES, Gardener, Syon House, Brentford.

PROTECTING BROCCOLI.—Broccoli plants are not now layed or heeled over as much as was formerly the case; but after the experience of the past two winters, it will be prudent if the old method be followed. Growth is very tender this season, and should sharp frosts come, there will be much loss to deplore. No time should therefore be lost in laying the later-heading Broccolis, with the ends of the leaves turned to the north, protecting the stems with soil removed from one side of the plants, and making it firm about the stems, and so high up it that the bases of the leaves are protected; the heads may be smaller than unlayed plants, but it is better to have small heads than none at all. Early kinds coming into use need not be heeled in, but they can be put under cover when the heads are of usable size.

BROCCOLI AND CAULIFLOWERS IN FRAMES.—These, if in pots, will now require good attention. Have the sashes removed daily, weather permitting, keeping the plants free of mildew by the liberal use of dry wood-ashes sprinkled over the foliage and soil. Those plants which are growing in pots should have the latter sunk in finely-sifted coal-ashes, &c. But little root-moisture will be necessary after plunging the pots, and attention given to securing a sturdy plant, by free ventilation, when there is no frost, by day, and admitting air in small quantities by night.

SALADS.—Lettuce and Endive in frames will soon prove valuable. So far, salads have needed but little, if any, protection against frost, but means should now be taken to preserve them. Lettuce should be lifted with a ball of roots and soil, and planted in frames, or in fruit wall cases, &c., being well ventilated in mild weather to prevent decay, scarcely any water being afforded them, if the soil was moist when they were planted, one good watering being sufficient to settle the soil. If the plants have to be covered where they stand, the sashes should be placed over them at this date. Full-grown blanched heads may be covered with mats in severe weather; others, pricked out under frames for spring cutting, should likewise be covered at night, if frost threatens, and by day if the weather is wet. Endive needs much the same kind of treatment, except that it is hardier—that is, the large round-leaved Batavian is. The plants should be tied up, or otherwise blanched, in quantity sufficient for requirements. The curled-leaved Endives need the same sort of protection from the weather as Lettuce, soon decaying if frozen. Half-grown plants for succession may be protected

where growing, but not the curled varieties—these are too tender.

CHICORY AND DANDELION.—The roots of these plants should now be dug up, and stored in the root shed, after cutting off the tops to within 1 inch of the root.

CORN SALAD requires protection in hard weather, by litter or bracken being shaken over the bed.

FRUITS UNDER GLASS.

By J. RIDDELL, Gardener, Castle Howard, York.

PEACH AND NECTARINE BORDERS.—Exhausted trees are neither encouraging nor remunerative to the grower, and should therefore be replaced with young ones. This is most desirable when the borders are old, badly drained, and consequently unsuitable for the roots of these plants. The best time for commencing this operation is during the severe frosts of early winter, as walks and ground are then in good form to support the transport of materials over them. All things should therefore be in readiness for a start on the approach of hard weather. In clearing out the soil, no notice should be taken of its present depth, unless it rests on a stratum of gravel, for these old borders often reveal strange ideas of earlier days, some having 4 feet of soil above the drainage, while others may be found resting on a bed of cement 2½ feet below the surface (I have just had to deal with one of this kind). The kind of soil to be employed in forming the new border, and the natural means of drainage, should determine the amount of soil, &c., to take out. If the subsoil be gravel, and the turf which is to be used is of a loamy nature, then 2½ feet will be a sufficient depth, but if the under stratum be clay, a foot deeper will be necessary, in order that ample drainage may be provided by filling this space with stones or cliokers. Should, however, the soil for the new border be very stiff, and approaching clay in character, the border will be better if a little less than 2½ feet in depth. On the other hand, a sandy loam will be none the worse for being from 2½ to 3 feet deep for these trees. Of whatever nature the soil that is to be employed, it should be mixed with wood ashes, lime, chalk, or old plaster to the extent of four parts of soil to one of either of the last mentioned materials. To this compost I would add a cwt. of basic slag to every five loads, but no other manures, as the plants will grow freely enough for the first few years without any further assistance beyond an occasional dressing with kainit during the growing season. After renovations of this sort, it is sometimes desirable to erect new trellising, and in doing so these ought to be placed so that the largest area possible in the structure will be utilised for the production of fruit. For lean-to houses, a curvilinear trellis, running from the front to within 4 or 5 feet of the back wall, and about 6 feet at this point in height from the floor of the house, should be provided. Besides this trellis, the wall itself should be wired. A thorough cleansing and re-painting of all wood and iron-work should also be effected, and if scale has been present, syringing the walls with paraffin oil before whitewashing them. Every means should be taken to secure entire immunity from insect pests, and this done, make sure that none but clean trees find a place within.

THE FLOWER GARDEN.

By H. W. WARD, Gardener, Longford Castle, Salisbury.

CARRIAGE DRIVES.—There are nooks and open spaces in close proximity to carriage-drives which, by planting with alternate clumps of good varieties of Rhododendrons, evergreens, and flowering trees and shrubs, would be considerably improved. Where there is a good expanse of turf on either side, such beds or belts should be made of considerable size, irregular, and at fairly wide distances apart. Among flowering shrubs the Weigelas should be included. Scarlet Oaks, Japanese Maples (see p. 616), and other subjects, which are noted for the beauty of their autumn tints, should be planted. The ground should be prepared in the manner described in the Calendar for November 19, p. 616, and the trees and shrubs put pretty closely together for immediate effect, subsequently thinning out and transplanting elsewhere before they get crowded.

CLOTHING TRUNKS OF OLD TREES.—There are to be found in most places half-dead gnarled trees whose trunks and branches might be rendered attractive by planting the under-mentioned climbers

at their base, and training their rambling shoots over them, namely Clematis Jackmanni, C. flam-mula, C. vitalba, Ampelopsis hederacea (Virginian Creeper), A. Veitchii, Lonicera brachypoda and L. sempervirens (evergreen Honeysuckle), Wisteria sinensis, Passiflora cocculea (in southern counties), Jasminum nudiflorum (yellow), J. officinale (white), J. revolutum (yellow), Vitis heterophylla, and such Roses as Banksiaeflora, Adelaide d'Orléans, Donna Maria, Félicité-Perpétue, Jules Margottin, General Jacqueminot, Achille Gounod, and Celine Forestier.

ROSE CUTTINGS.—Cuttings taken off with a heel, if not already done, may now be put in, in rows about 9 inches apart, and 2 inches in the row, on a north or east border, where the soil is light and sandy. The cuttings, about 9 inches long, may be inserted 5 or 6 inches deep, pressing the soil firmly. Cuttings may also be inserted in pots or boxes filled with sandy soil, watered, and placed in a cold pit or frame. In the spring, these can be put in heat, and potted off singly into 3-inch pots as soon as they are well rooted.

PRUNING DECIDUOUS TREES AND SHRUBS.—Any deciduous trees and shrubs that require their shoots thinned out or shortened back, should be seen to forthwith; doing the work in such a manner as to conceal the wounds made during the operation, as much as possible.

THE ORCHID HOUSES.

By H. A. BURBERRY, Orchid Grower, Highbury, Birmingham.

GENERAL CULTURE.—A good deal of trouble is experienced with many Orchids before the right position can be found for them. Step by step the orchidist finds for his plants places that are most favourable to growth, and having done this, it is well to be cautious before again removing them (except for the purpose of resting the plants), notwithstanding reverse treatment that he may read or hear of; for after all, owing to the various methods of building houses and the different aspects afforded them, the cool-house of one grower may resemble the intermediate-house of another in general conditions, and this I think is often a source of misguidance.

Ocimum cheiroporum, now showing flower-spikes, will probably be safer if placed in the intermediate-house for the winter. O. splendidum, also showing for flower, is a lovely species, but unfortunately it is rarely seen in a thriving condition, except for a few years. Its large leathery leaves seem to require a great amount of sunshine to mature them. I find it grows best suspended in the Mexican-house. O. Jonesianum should be wintered in the same house, but when growing, it requires the warmth of the Dendrobium-house. Odontoglossum Londeboroughianum is a species rarely to be observed grown to perfection. It thrives best here when afforded similar treatment to the Mexican Lælias. O. Phalenopsis should have the warmest end of the intermediate-house during winter, and be watered but sparingly, otherwise the tips of the leaves turn of a black colour, as in the case of O. vexillarium. Lælia harpophylla and L. monophylla do well in the coolest house, but Lælia msjalis should have the warmth of the Mexican-house, for if allowed to get too cool in the winter, the foliage is apt to turn yellow, and drop. Cattleya intermedia should have a little more warmth at this season than the type, as growth is now most active. C. Lawrenceana, which should be kept warm whilst growing, may be rested in the ordinary Cattleya-house. C. Percivalliana is just now pushing up its flowers, and if subjected to any sudden change of temperature, the flower-spike may turn black in the sheath, and consequently never open. A steady temperature of 55° to 65° will be best, in order to get flowers of good quality; the same conditions will apply to any C. Trianae which are forward in showing flower. Black spot on the foliage of Dendrobium thyrsoiflorum and D. densiflorum may generally be attributed to a low temperature in winter.

GENERAL WORK.—This will consist at this season of a thorough cleaning of the plants and of the houses. A good supply of sphagnum moss should be got in, and picked over ready for use. Potting commences early in the year, and then, owing to frosts and snow, it may not be convenient to get it. A supply of good fibrous peat should be got in stock also, and this may be broken in small pieces, and the fine particles taken from it during spare time. Tying-sticks in various lengths should be painted, and other necessaries, such as labels, &c., be got ready.

EDITORIAL NOTICES.

LETTERS FOR PUBLICATION.—All communications intended for publication, as well as specimens and plants for naming, should be addressed to the Editor, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

PLANTS, &c., TO BE NAMED.—Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week. Specimens should be carefully packed and numbered, and not more than six should be sent at one time.

Advertisements should not be sent to the Editor, but to the Publisher.

APPOINTMENTS FOR THE ENSUING WEEK.

MEETINGS.

MONDAY,	DEC. 5.	Smithfield Cattle Show commences, and will include the usual classes for roots and seeds.
THURSDAY,	DEC. 8.	Brighton and Sussex New Horticultural Society.
SATURDAY,	DEC. 10.	Royal Botanic Society.

SALES

MONDAY,	DEC. 5.	Dutch Bulbs, at Stevens' Rooms. Bulbs and Plants, at Protheroe & Morris' Rooms.
TUESDAY,	DEC. 6.	Bulbs and Orchids, at Protheroe & Morris' Rooms.
WEDNESDAY,	DEC. 7.	Lilies and Bulbs at Protheroe & Morris' Rooms. Liliams from Japan at Stevens' Rooms.
THURSDAY,	DEC. 8.	Plants and Bulbs at Protheroe & Morris' Rooms. Roses, Shrubs, and Border Plants at Stevens' Rooms.
FRIDAY,	DEC. 9.	Large Orchid Sale, by order of Mr. F. Sander, at Messrs. Protheroe & Morris' Rooms.
SATURDAY,	DEC. 10.	Lily of the Valley, Spireas, &c., at Stevens' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—41°·1.

DECIDEDLY one of the most encouraging signs of the times is the tendency everywhere observable, where circumstances permit, to diffuse a knowledge of first principles in agriculture and horticulture. In other cases it is impossible to do otherwise for the present than rush at once into practical details, in spite of the fact that they would ultimately be much more fruitful if based upon previous knowledge of principles. But we must take things as we find them, and make the best of the opportunities which present themselves at the moment. And so we cannot but rejoice at the continued progress of sound practical teaching in our villages through the agency of the County Council lecturers. It is, in a measure, the realisation of hopes, and a step toward the fulfilment, of what has been advocated in these columns for years past.

Intimately connected with the subject of technical education is the question of allotments for the rural population. It would be of no use teaching a man how a fruit tree grows, and how it should be treated to produce the best results, if he is to be deprived of all means of carrying into practice what he has been taught. We want to make a man a contented and a competent citizen. To do this, we must give those who cannot help themselves every available help in feeding both mind and body, so as to enable them to work to their own advantage, and the benefit of the community. To this end we clothe and educate and watch over the interests of our children. To this end should those who have the power, aid in the development of the labourer, and the promotion of the welfare of the

country. One means of effecting these objects is doubtless supplied by the granting of allotments to competent men under equitable conditions. On this subject, Mr. BRUCE FINDLAY has recently been expressing his views to the citizens of Manchester. We need not say Mr. FINDLAY'S remarks are worthy of respectful consideration. Limitations of space forbid us from doing more than laying certain portions only of Mr. FINDLAY'S address before our readers—enough, however, we think, to illustrate his views and substantiate our statements.

"It seems to me that in no way can the objects of a Botanical and Horticultural Society be more efficiently accomplished than becoming as it were a centre towards which all the practical improvements made in its vicinity shall tend, and from which they may again be disseminated to fructify in a wider circle. In looking over the published proceedings in connection with the Fruit Congress of last year, there are, of course, many inferences to be drawn. The President of the first day's Conference, the Earl of Derby, made a few observations which I think deserve most careful consideration. His lordship said, 'that every expedient which tends to increase the value of English soil and leads to the profitable employment of labour upon it deserves our serious attention.' It seems to me that this statesmanlike utterance is pregnant with meaning. We think that the extension of fruit culture in this country will tend very much to 'increase the value of English soil.'

"We are all absolutely dependent upon the vegetable world for our existence; this is, of course, a simple elementary fact, but I fear that the bulk of mankind are prone to forget first principles. There seems to be a tendency in this age to 'leave the elementary principles,' and 'go on' to, alas, not 'perfection,' but things of a baser sort. I suppose that it will be admitted without controversy that the food we eat (whether animal or vegetable), the raiment we wear, the fuel we burn, and all the elegancies of life come to us from God's works, as set forth in the vegetable kingdom. Seeing that these things are so, why, I ask, should our rulers in this country be so backward to recognise the importance of this matter under consideration? If a vote on account is proposed in Parliament to purchase some works of art, costing the nation a million of pounds, there is not much difficulty in passing such a resolution. But if it is proposed to spend a few thousands in connection with agriculture or horticulture, the 'items' shake empty heads and cry 'madness.'

"There is at the present time a larger quantity of land devoted to the cultivation of fruit than has been the case at any previous period in our history, but this has only been brought about very recently. 'For many years prior to 1887, the system of granting garden allotments to agricultural labourers and to others of our rural populations had been established.' The returns showing the number of allotments granted from the date of the passing of the Allotments Act in 1887, prove that a very large number of people have availed themselves of the privileges of this Act. For many years prior to the passing of this measure it was well known that the agricultural labourers of this country had not the same interest in the soil as they once had. A constant dis severing of the land from the limited holders had been going on for several centuries. Though a necessary consequence of the improved state of agriculture, the decay of the cottar tenantry was an evil which was not sufficiently appreciated.

"It seems to me consistent with sound policy to let every English labourer, when practicable, have some certain provision uninfluenced by the fluctuations of the labour market to which he might resort in time of need. My recommendation is that, however small, he should, if possible, have his share of the land. History speaks loudly and distinctly on this point, and traces the melancholy fate of the most powerful empires and states to the cutting off of every particle

of the soil from those who were so closely attached to it. I wish not to be misunderstood on this important point, and beg to state that I entirely disapprove of any and every scheme which means confiscation and robbery; equality of possessions cannot surely be entertained seriously by anyone. But there can be no doubt, I think, that it would be well, if possible, to admit all into the benefits of the social compact, for the man who rents a perch of land is invariably found to be a better subject than he who is without any. He is more disposed to obey the laws of his country, and more energetic in spreading abroad a love for those laws, just because he knows that to them he is indebted for the preservation of his little property.

"The records which are available enable us to form a fairly approximate estimate of the impetus given to the extension by the discussion, and by the passing the Allotments Acts. The following figures seem to me rather startling. The number of allotments in Great Britain in the year 1873 amounted to 246,398, and in the year 1890 to 455,005. The increase per annum between the years 1873 to 1886, a period of thirteen years, amounted to 8569, and from the years 1886 to 1890, a period of four years, 24,302. It is noteworthy that the rate of annual increase in the last four years has been apparently three times as rapid as between 1873 and 1886. Clearly, then, there has been a great increase in the acquirement of allotments, directly or indirectly, under the influence of the Allotments Acts of 1887 and 1890, and it is probable that the increase will continue for some time to come. Nor can there be any doubt that such allotments are a very great boon, especially to rural populations.

"I have very little faith in the 'various ways' by which some propose to better the condition of the agricultural labourer. A 'variety of measures' is, in my opinion, quite incompatible with his capacities, his powers being altogether centred in the soil, and in sowing and reaping its products. Out of this element he is timid and helpless, but in it all his powers seem to be gratified, and the desire he evinces to become possessed of a patch of land to cultivate on his own account, is little short of a passion.

"I do not for a moment consider that the best system of allotments would be a universal panacea applicable to every labouring man. The allotment system itself will throw out thousands as unworthy to touch the soil. Let us look at the chief agent which it embraces—vegetation. It is stirring either in a right or wrong direction every hour of our life. Of what use, therefore, would sluggards prove in directing such a power; or stupefied drunkards far away in the alehouse; or the various other inert classes who hate to work, and who would rather let their crops rot in the fields than answer the demands upon them for exertion? In truth, no system will save such men, and at last, if at all, they are fit only to be servants of others, their best master being anyone save themselves.

"What is wanted is, that those who engage in the cultivation of fruit upon land which does not belong to them should have greater security for their outlay than exists at the present time. Lord DERBY said on this subject, 'I am quite sure that when disputes occur between landlord and tenant, they arise in nine cases out of ten not out of a wish on either side to over-reach the other, but from the easy rural fashion of letting things go on without distinct and definite agreement as to the rights of both parties, but on the basis of some vague understanding which is apt to end in misunderstanding.' It seems to me only fair and just that tenants should be able to secure adequate compensation for unexhausted improvements or security of tenure. I have often thought that if the middlemen were out of the way, and landlord and tenant brought face to face with each other, that we should not have so much heartburning in connection with the matter. I mean by the middlemen the political agitator and the landlord's agent. The former often persuades the tenant to

DENDROCALAMUS SIKKIMENSIS, IN THE CONSERVATORY, CASTLEWELLAN.

pay no rent even when he can afford to do so; the latter very often deals with the tenant in a most harsh and arbitrary way, the result being in both instances most unsatisfactory.

"That the subject with which we are dealing is one of the most vital imports is clearly proved by the public press. The position of many farmers is most deplorable, and the wretched climatic conditions through which we have recently passed have tended very much to intensify this lamentable state of things. The question is—What is the remedy? or is there a remedy?"

"In his address at the Fruit Conference, Sir JAMES WHITEHEAD said, 'That those who engage in the cultivation of fruit upon land which does not belong to them should have greater security for their outlay than exists at the present time. If a tenant quits his holding before ten years have expired from the time of the planting of the fruit trees, the cost of the trees, and the tending to them for five years, should be a permanent improvement under the cultural Holdings Act; or the trees should be taken at a valuation, either by the landlord or by the incoming tenant.'

"I have very great hope indeed that the allotment system will have a most salutary effect upon our rural population when it gets into full swing. It will inspire hope in the breast of the labouring-man. The only hope worthy of encouragement arises from the labours of the man himself, and inspires him in every industrial art—in digging, sowing, reaping, and in all other services, whether performed for himself or his employer, because he knows that, in either case, they invariably carry their reward with them. They also call into exercise the virtue of prudence. Where no gain can be made, the labourer is too apt to settle down into a state of indifference.

"Is it likely that a man will care much about being industrious when no one by his industry can avoid being a pauper? Once enable a man to save a few shillings, and a love of independence takes possession of him, and with that an incitement to sober habits. Considered as a moral agent, the allotment system is active and powerful. To have an industrious, contented, and happy population is even more than can at all times be expected in our present state. This, however, the allotment system, when properly conducted, will, I think, go far to ensure."

DENDROCALAMUS SIKKIMENSIS.—We are indebted to the courtesy of the Earl of ANNESLEY, for the opportunity of figuring this handsome Bamboo. It is planted in the Winter Garden at Castlewellan, co. Down. It was received from India as a small plant in a Wardian case, but is now about 16 feet high. It is a noble Bamboo, and well worthy of cultivation by those who can afford the necessary space. The leaf is like that of *Bambusa palmata*, but longer and larger. It is doubtful if it will prove hardy, though in view of the hardihood of some of the Japanese species, it would be quite worth trying in suitable situations. A figure of the foliage is given in a former volume, June 28th, 1890.

PROFESSORIAL APPOINTMENT.—Mr. FRANCIS ARWIN, son of the great Naturalist, and the joint author of *The Power of Movement in Plants*, and at present Reader in Botany at Cambridge, has, on the nomination of Professor BABINGTON, been appointed Deputy-Professor for the current academical year.

THE GARDENERS' ROYAL BENEVOLENT INSTITUTION.—We have received notice from Mr. GEORGE J. INGRAM, Secretary, of a general meeting of the members of the Institution, which will be held at Simpson's Restaurant, Strand, London, on Tuesday, December 20, 1892, at 3 P.M., for the purpose of passing a special resolution to change the name of the Institution from the Benevolent Institution for the Relief of Aged and Indigent Gardeners and their Widows, which was the original designation, to that of The Gardeners' Royal Benevolent Institution, by which it is now generally known, for the purpose of registration. Some alterations and additions to

the rules of the Institution, recommended by the committee of management, will also be considered at the same time.

KENT COUNTY COUNCIL.—The Experiments Committee met last Thursday at the Horticultural College, Swanley. Amongst the letters read was one from Mr. BASIL HODGES, C.C., dealing very ably with the difficulties with which farmers and growers have to contend in purchasing artificial manures. It transpired that a resolution had already been entered upon the minutes, which accorded with Mr. BASIL HODGES' opinion that only manures of known composition and analysis should be used in the Committee's experiments, and a long discussion ensued as to the best way to render assistance to growers in the matter. Professor CHESHIRE promised to bring before the Committee at their next meeting a new method he had devised, whereby those not possessing a knowledge of chemistry could determine in what constituents any soil might be deficient, and thus know how to proceed in the purchase of artificial manures. Letters from Lord SUDELEY and Mr. BEACH were read, giving the results of trials in fruit evaporation, which tended to confirm the general opinion of the Committee that this method of fruit preservation is not likely to prove remunerative in England. It was, however, decided that a final trial should be made at the College next summer, with a machine kindly placed at the disposal of the Committee by Mr. E. D. HILL. Professor CHESHIRE then gave an address on the use of basic slag, illustrating his remarks by various experiments. Basic slag is a waste product of steel manufacturers, very finely ground, and containing thirty-five to forty-five per cent. phosphate and ten per cent. iron. The present price is about fifty shillings a ton. Some very good specimens of Lupin and Clover were exhibited, to show the nodules on the roots, which accumulate nitrogen from the air.

TECHNICAL LECTURES IN HORTICULTURE.—We are glad to hear that, in spite of dense fogs and other climatal impediments, the lectures in the provinces have progressed satisfactorily. Mr. FISH has just completed a first course of twenty-five lectures in Cambridgeshire, and is now engaged in other districts. Great interest is shown in these lectures, and much sympathy and hospitality evinced by landowners and clergy.

GARDENERS' ORPHAN FUND.—We would draw the attention of our readers to a benefit which is to be given in aid of the above most-deserving charity at "Venice in London" at Olympia during the Cattle Show week, from December the 5th to 10th, and from the 12th to 17th. The usual attractions of the place will be enhanced by the band of the Grenadier Guards under the personal leadership of Lieutenant Dan Godfrey, the London Orchestral Band, conducted by Mr. Dan Godfrey, jun., and the military band of forty Carabinieri. New costumes to the value of £10,000 have been added to the grand spectacle. Tickets of admission can be obtained before the dates mentioned from the leading nurserymen, seedsmen, and florists, the members of the executive committee of the Gardeners' Orphan Fund, from our office, and of the hon. secretary, Mr. A. F. BARRON, Royal Horticultural Gardens, Chiswick. These tickets are identical with those sold at Olympia at similar prices, and entitle the holders to similar seats. It has been arranged that payments made at the doors will not benefit the Fund. Olympia, *via* Addison Road station, is easily reached by the Metropolitan, District, London and North Western, London and South Western, Great Western, and London, Brighton, & South Coast railways.

THE NATIONAL CHRYSANTHEMUM SOCIETY.—The Committee of the above society are engaged in repaying in full the compliments paid them by the Chrysanthemum growers in New Zealand, when, represented by Mr. JOHN EARLAND, they sent across to the mother country, in a frozen condition, the flowers raised by the latter. The Committee have

made arrangements with the Cold Storage Company at Blackfriars, to freeze and forward to New Zealand a number of blooms for exhibition at the annual show at Wellington in April next. Mr. W. HERBERT FOWLER of Taunton has furnished the Committee with a dozen of the finest Japanese blooms, with which he won one of the Holmes Memorial Challenge Cups at the exhibition at the Royal Aquarium on November 8; and a similar number of the finest incurred varieties shown, by Mr. W. MEASE, *gr.* to A. TATE, Esq., Downside Leatherhead. Instead of freezing each bloom in a metal cylinder, as was done in the case of the flowers sent from New Zealand, the blooms have been placed in an ordinary stand for twelve, with cups and tubes complete, as if to be staged for exhibition; they were then stood in a zinc case 15 inches in depth, but sufficiently roomy to admit of there being 3 inches of water all round the stand when in position. The body of water will be gradually frozen—an operation requiring several days—the lid of the zinc case soldered down, placed in a wooden case, covered with sawdust, and that in its turn carefully fastened. The two cases will then be despatched to New Zealand, and Chrysanthemum growers at the Antipodes will have an opportunity of seeing some of the best productions of English growers. The project and its successful carrying is largely due to Mr. ROBERT BALLANTINE, the chairman of the committee, and he has had the hearty co-operation of Mr. KAYE, the Manager of the Cold Storage Company, who has rendered every facility, and offered to convey the cases to New Zealand free of cost.

DUTCH HORTICULTURAL AND BOTANICAL SOCIETY.—The Floral Committee of the above on the occasion of the meetings of the Society on October 12 and November 9, made the following awards.—First-class Certificates to E. H. KRÉLAGE & SON, Haarlem, for *Dahlia* "Rosa cactus" (introduced new plant); *Kniphofia* *hydr.* "Chloris" (introduced new plant); *K. foliosa* Hochstetter (insufficiently-known plant). To Mr. C. G. VAN TUBERGEN, JR., Haarlem, for *Cyrtanthus hybridus* (*C. sanguineus* × *Vallota purpurea*) (new plant); *Nerine pudica* Hook. var. *alba pura* (new plant); *N. sarniensis* Herb. var. *carnea* (new plant). Second-class Certificates to Messrs. ANT. ROOZEN & SON, Overveen, for *Eryngium amethystinum*, Linn.; to Messrs. E. H. KRÉLAGE & SON, Haarlem, for *Cactus Dahlia* "Millie Cupham" (introduced new plant); *Kniphofia aloides magnifica* (insufficiently-known plant); *K. speciosa*, Baker (introduced new plant); to Mr. C. G. Van Tubergen, Jr., Haarlem, for *Nerine amabilis*, Hort. var. *rosea* (new plant); *N. hydr.* "Novelty" var. *striata* (new plant); *N. pudica*, Hook, var. *rosea* (new plant).

BRAZILIAN EXHIBITION.—The exhibition of Brazilian Orchids and other products, which is to be got together in Paris under the superintendence of the Viscount de SAINT LÉGER, will not be opened till April. Owing to a misapprehension, we lately announced it as already opened.

LONDON PANSY SOCIETY.—The first meeting of the above Society was held at the Guildhall Tavern on November 24. A number of gentlemen interested in the subject attended, and rules, &c., were drawn up which will be submitted at the general meeting to be held early in January, 1893. The Hon. Secretary is Mr. GEO. McLEOD, Chingford, from whom the rules of membership and other information can be obtained regarding the objects of the Society.

CARDIFF GARDENERS' SOCIETY.—At the weekly meeting of this Society on Tuesday last, a paper on "The Culture of the Gloxinia," was read by Mr. CLARK, *gr.* to Colonel HILL, Rookwood, Llandaff. A good discussion, led by Mr. HOCKEY, followed. The subject for next week is "Cyclamen Culture," by Mr. WALL.

CHRYSANTHEMUMS AT AMSTERDAM.—The third National Chrysanthemum exhibition of the

Dutch Horticultural and Botanic Society at Amsterdam was a highly interesting one. Looked forward to with more than ordinary interest by specialists and lovers in general of this gay and popular flower, it was to them the great horticultural event of the year. Indeed, the Chrysanthemum show was a very distinct advance upon the work of former years. There was a bright and attractive display of splendid and new varieties; groups sent by KUYK BROTHERS from Utrecht, and Messrs. GROENEWEGEN & Co. from Amsterdam, were admirable in every respect—a glow of colour; such varieties as the following were shown: Louis Bohmer, Edwin Lonsdale, Etoile de Lyon, Edwin Molyneux, W. H. Lincoln, Delaware, H. Ballantine, Madame Marie Hoste, Enfant des Deux Mondes, Lun-down, and many other choice varieties. All plants perfectly cultivated, and with very large flowers.

THE CHRYSANTHEMUM AT HAMBURG.—A fine display of Chrysanthemums was made on November 17 and three following days at the Zoological Gardens, by Messrs. GOTZE & HAMKENS, nurserymen, of Wansbeck, Hamburg. The firm, which makes a speciality of this flower, had more than 2000 plants, tastefully arranged, and the body of the hall was occupied by three large beds, in the centre one of which the different varieties were placed in groups, and the other beds contained numerous fine specimens of leading varieties, good dwarf plants being employed to form an edging to these. Small branches of Spruce Fir were used to hide the outer row of pots from view. The exhibition, which attracted a great number of visitors, was the first of the kind ever held in Hamburg.

POTATOS AT THE BIRMINGHAM CATTLE AND ROOT SHOW.—A splendid display of tubers was made at this show in competition for the prizes offered by the Society. That fine Potato, Sutton's Satisfaction, seemed to be the most popular variety amongst exhibitors, as it was staged no fewer than twenty-six times, and appeared in the first prize lots in six classes out of nine devoted to Potatoes already in commerce, as well as taking the first prize in the class for the most handsome dish of any variety.

VEGETARIANISM.—The Christmas Number of *The Vegetarian* promises to be a very interesting one. It will contain articles by A. F. Hills, President of the London Vegetarian Society; Rev. Prof. J. E. B. Mayor, Senior Fellow of St. John's College, Cambridge; Josiah Oldfield, M.A., B.C.L.; Sir Charles Cameron, M.D., Prof. Wynter Blyth, Alderman Harry Phillips, and many other well-known advocates of vegetarian principles.

WOOLLENISED JUTE.—We have more than once recorded the progress made in the preparation of "woollenised jute," a new fibre to be spun into material for upholsterers' use. The manufacturers in Dundee, who were for some time in competition with a French firm spinning fibre for the same purpose from China-grass, have recently patented their invention, and have already so great a demand for it that it is being dyed, it is said, by the ton, in eighteen shades. From the sample we have seen, we should say that it is likely to continue a success, being evenly coloured throughout, and extremely strong.

M. EDOUARD ANDRÉ.—This eminent landscape gardener has been nominated Professor of landscape gardening and construction at L'Ecole Nationale d'Horticulture at Versailles.

THE DARWIN MEDAL.—At the anniversary meeting of the Royal Society on Wednesday last, the Darwin Medal was awarded to Sir JOSEPH HOOKER. Professor HUXLEY, in alluding to the matter at the dinner presided over by Lord KELVIN, the President, said: The Darwin Medal was instituted in honour of one of his best and dearest friends, and it was now

conferred upon a man who was one of the staunchest friends he had had for the last forty years. He might fairly appeal to Sir JOSEPH HOOKER's present activity, put him down also among the young men, and thereby save the credit of the Council in the matter of its own regulation. To those who knew the *Life and Letters of Darwin*, talk about Sir JOSEPH HOOKER's right to the Darwin Medal was as futile as the attempt to judge MANLIUS in sight of the Capitol. He knew no more remarkable example of life-long devotion, of stores of information laid open, of useful criticism, and of still more useful encouragement, by one man to another, than that exhibited by Sir JOSEPH HOOKER in this picture. It might be that even the man whose motto was, "It's dogged as does it," and who so patiently laboured for half a lifetime at the great fabric of the origin of species, might have fainted by the way without this friend's aid. And, assuredly, HOOKER's great study of geographical distribution was a most important factor in DARWIN's work. It lay in the eternal fitness of things that WALLACE and HOOKER should receive the Darwin Medal; and that these old young-men should give it a heightened value for the young young-men to whom it would hereafter pass. Mr. LANGLEY responded for the other medallists and himself, and in the course of his speech he read the following extract from a letter from Sir JOSEPH HOOKER:—"The award to me of the Darwin Medal is a triple source of gratification; for, first, the honour is a very great one and most dearly prized; then its receipt from the hand of a president whom I have known personally almost from childhood (for we sat together in his father's mathematical class at Glasgow nearer sixty than fifty years ago) adds a special interest to the award; and, lastly, the allusion which the president and council have been pleased to make to my intimate association with my venerated master in studies preliminary to the *Origin of Species* has, I need not say, affected me deeply. That association was indeed intimate; its birth, youth, and maturity are detailed in full in the masterly 'Life' of his father, written by FRANCIS DARWIN; and that it has been thought worthy of record by the Royal Society, as an episode in the history of the Darwin Medal, is a crowning honour, for which I tender my sincerest thanks."

THE EARLIER OPENING OF KEW GARDENS—A deputation from the Richmond Town Council waited upon Mr. SHAW-LEFEVRE, M.P., First Commissioner of Works, for the purpose of urging upon him that Kew Gardens should be opened to the public at 9 o'clock in the morning, instead of 12 as at present. Mr. SHAW-LEFEVRE was accompanied by Mr. DYER, Director of the Royal Gardens; and Mr. H. W. PRIMROSE, Secretary to the Office of Works. Mr. SHAW-LEFEVRE, in reply, expressed his sympathy with the general object of the deputation. The question of the earlier opening of Kew Gardens was an old story, but it was one that was not altogether free from difficulty. In 1879, it was the subject of a long discussion in the House of Commons upon a motion by Sir TREVOR LAWRENCE, and it was then stated by the First Commissioner that the opening of the gardens at 9 o'clock throughout the year would entail an additional cost upon the management of from £1,500 to £2,000 a year. The Commissioner also alleged other arguments against it, and was supported by a considerable number of members of the House in the interests of science, it being pointed out that the use of the gardens in the early part of the day for scientific investigation was most important, and was a privilege that was highly appreciated. He had been recently further considering the matter, and had referred the question of expense to a committee, which was now considering the labourers' wages at Kew and in the Royal parks generally, and until he knew accurately what the real cost of the arrangement suggested by the deputation would be, he could not come to a final determination upon the matter. It was certain, however, that the expense would not be inconsiderable. He disputed the statement of the deputation, that not much watching would be

required in the gardens in the early morning, for the Director assured him that it was just when there were few people about that most watching was required. The gardens were now, and for some time had been, open to the public on the mornings of Bank holidays, and although railway companies advertised that fact very largely, comparatively few people arrived before 12 o'clock, the great mass of people who went in such throngs on those occasions making their appearance after that hour. It must also be borne in mind that there was a great interest in the other direction, namely, that of the scientific men who were allowed the privilege of frequenting the gardens in the morning, and Sir JOSEPH HOOKER, when director, reported very strongly against that privilege being withdrawn. A large number of persons now availed themselves of that regulation, and he had received letters from gentlemen interested in the gardens objecting to the withdrawal of the privilege by the general admission of the public, and stating that it was of great importance in the interests of science that scientists should still have special opportunities of studying the plants. Among others, he had a letter from an eminent scientific man, Mr. ALFRED WALLACE, a distinguished advocate of land nationalisation, who no doubt would have special views on the subject upon public grounds, and who said that he had frequently gone into the gardens for some days together for the purpose of being allowed to handle the plants and to make investigations of a minute character that would be wholly impossible if the public generally were admitted. He could only say that he would carefully consider the question after he had ascertained what the cost would be. He believed that the present Chancellor of the Exchequer had the same general sympathy which he had with the public movement in favour of open spaces. Both the public interest and the interest of scientific men should be fully considered. *Times*.

CHICAGO EXHIBITION.—We learn that Mr. J. MCINDOE, gr. to Sir J. W. PEASE, Bart., M.P., Hutton Hall, Guisborough, has been applied to by the executive of the above to exhibit at the Great Horticultural Show, which will be held in the autumn of 1893, a collection of fruit similar to the one shown by him at the International Exhibition, Earl's Court, in August last. Mr. MCINDOE has accepted the invitation.

PLANT PORTRAITS.

BULBOPHYLLUM ANCEPS, Rolfe, sp. n., Borneo, *Lindenia*, t. 351.

DENDROBIUM MACCARTHYI, *Lindenia*, t. 349.

STANHOPEA INSIGNIS, *Lindenia*, t. 352.

NOTICES OF BOOKS.

BENEATH HELVELLYN'S SHADE. By Samuel Barber. (Elliot Stock, Paternoster Row.)

This is a book which we should expect to find in the reading-room of an hotel in the Lake District, and is perhaps written with this idea in view. It is a thin volume, composed of fourteen short chapters, eked out with much margin, and many nearly blank pages. The author has endeavoured "to be exact as far as was possible," and considers that a "fragmentary or sketchy treatment" of his subject is not inconsistent with "accuracy, and, indeed, thoroughness." After this introduction, we are not surprised to find that he discourses in short space on many most varied subjects, ranging from archæology to the clouds. The weather has been the principal subject of Mr. Barber's search, and this is only natural, considering the climate of Wythburn and the neighbourhood. We are treated to long descrip-

tions of cloud and mist effects, and to attempts at classification of the many shapes the ever-changing clouds assume. "Vaporology" is certainly a neglected science at present. As was inevitable in such a book, the quotations from Wordsworth are many, and altogether this is not a conventional guide-book, nor a sermon, nor a scientific treatise, but a mixture of all three with information with which no other single volume could furnish the reader. Its interest is essentially local, and it may be considered, on the whole, an acceptable addition to the literature of the neighbourhood. It is not illustrated.

SHARP EYES: A RAMBLER'S CALENDAR OF FIFTY-TWO WEEKS AMONG INSECTS, BIRDS, AND FLOWERS. By Wm. Hamilton Gibson. (Harper and Brothers, Franklin Street, New York.)

This is a very elegantly got up book, and its appearance at this season of the year suggests it as appropriate for a gift which will be equally welcome in the school-room as in the drawing-room. The author discourses, as his title would lead us to expect, upon the natural history of the year, interspersing his remarks with many pretty pictures of various sizes, drawn by his own pencil. As the book emanates from New York, some of the "popular" names as well as the creatures to which they refer will not be familiar to European readers. The information given is suggestive rather than exhaustive, and the author, with no pretence to scientific exactitude, endeavours to incite those with sharp eyes to observe for themselves some of the manifold details of the nature around them. A guide so pleasantly written and so attractive in appearance should be very popular.

CULTURE VERSUS NATURE.

In a paper under this heading, published in your issue of July 9 last, the following appears:—"You may collect two plants from a mountain-side, 10,000 feet or so in altitude, near the equator, and one will be perfectly hardy in Northern Europe, and the other will die at the first touch of frost. Why this is we do not fully know; but we may at least keep the question in our minds, and hope some day to solve the problem."

There should be no difficulty in accounting for this apparent anomaly.

The altitudinal range within which plants grow, either in a state of Nature or under cultivation, on the mountains of the tropics, averages, as a rule, some 3000 feet, that is, on ascending the mountain when a given plant is first noticed at, say, 5000 feet, we find its range likely to extend up to about 8000 feet. But some plants have a more restricted vertical distribution, such as various species of Cinchona, with a range of less than 2000 feet; others, again, have a range embracing 6000 feet, and even more. The range diminishes on receding from the equator towards the confines of the tropics.

A very remarkable instance of the constitutional flexibility with which some plants are endowed, may be adduced in the case of Maize (*Zea Mays*), than which, in all probability, no other important cultivated plant flourishes under conditions of elevations so diversified. Throughout the tropics Maize is largely cultivated from the level of the sea; and in Colombia it is most extensively cultivated at all heights up to 9600 feet, at which the crops require twelve months to ripen. The difference between the temperature at the level of the sea, and at 9600 feet is very marked, the one a sweltering tropical clime, the other a cold region, in which touches of frost frequently occur.

We have thus an extreme range of 9600 feet for one plant, a plant cultivated throughout on a great scale, and with the utmost success; a plant which is not only the companion of the Cocoa-nut Palm on the hottest plains, but everywhere accompanies upland Coffee culture, and extends through and considerably above the still more elevated Cinchona region, thence grows side by side with Oats, Barley, and Potatoes; furthermore, a plant that will not

yield even to the Apple tree, or the Peach tree, or to the wild Strawberry, for these prefer a warmer climate lower down the Andes.

We know nothing of the limits to which each of the two species growing at 10,000 feet extend. It may be that this altitude is the mean for both species, but one of them is constitutionally fitted to occupy a wider area of distribution, thus penetrating near to the line of perpetual snow; or it may be that the two species diverge from the altitude indicated in opposite directions. *Robert Thomson, Bogota, Republic of Colombia, September 20, 1892 (formerly Superintendent Botanical Department, Jamaica).*

WASHINGTONIA FILIFERA.

I AM of opinion that the photograph sent you as of *Washingtonia filifera* (see *Gardeners' Chronicle*, November 12, p. 591), really represents a *Sabal*, probably *S. Blackburniana*, the giant Fan-palm of Bermuda, of which there is a fine specimen in the Kew Palm-house; or it may be *S. Palmetto*, the Saw-Palm of the S. United States. *Washingtonia* is a well-marked genus, probably monotypic, and is characterised by a very stout stem, large fan-shaped leaves, with stout sheathing petioles, the margins of which are armed with stout broad-based dark brown spines. These spines and the long thread-like white filaments, which hang in profusion from the leaf segments, are characters which taken together are sufficient to identify *Washingtonia* from all other genera of Palms.

There is a most interesting account of this Californian Palm in *Garden and Forest*, vol. iii. (1890), p. 51, by Mr. G. B. Parish, of San Bernardino, which contains a great deal of information respecting the stature and habits of the *Washingtonia* in the deserts of California, where it is as remarkable an arboreal feature as the *Sequoia* is in the forests of the sierra. It is there known as the Desert Palm. Mr. Parish says:—"75 feet is probably the greatest height reached by the Desert Palm. The top is crowned by a cluster of light green leaves, whose stout stems (petioles), deeply channeled, and beset along the edges with hooked spines, are 8 feet or more in length. The plaited blades are some 4 feet in diameter glabellately cleft at the edges, which are abundantly furnished with long thread-like filaments.

"A mature tree produces in June three or four large panicles of small scarious flowers. The stout terete peduncle ascends from the axil of a leaf near the centre of the crown, and is of the length of the petioles, so that the ultimate divisions droop over the blades. Gradually the peduncle declines, till in September or October the ripe fruit hangs pendent over the mass of dead leaves. Each cluster produces some ten pounds of fruit, the size of a large Pea, with a thin sweetish pulp, and a bony seed.

"A tree growing on Second Street, in San Bernardino, twenty-two years old, from the seed, measures: to the leaves 22 feet, crown 10 feet, total height, 32 feet; circumference (of stem), 3 feet from the ground, 9 feet 2 inches. This tree has produced flowers and fruit, for the first time, the present year (1890).

"During the last few years many thousands of these Palms have been planted in southern California, which in time will become notable features in the landscape."

Two trees of *W. filifera*, growing at Los Angeles, in California, are said to be about 95 feet high, and to have trunks 7 feet in diameter. They are supposed to be a hundred years old. The rate of growth of this Palm is astonishingly rapid. It is one of the commonest Palms in the gardens on the Riviera, where many of the specimens are quite enormous, although only about eighteen years old. Three years ago I saw some there with stems 15 feet high, and one, which I was assured was only twelve years old, had a stem 10 feet high, and nearly 3 feet in diameter at the base, whilst the head, which was composed of about ninety large leaves, was 20 feet through. The thickest stem I saw was a little over 14 feet in circumference. The stems when young are

more or less Onion-shaped, i.e., swollen at the base. There must be hundreds of thousands of this grand Palm on the Riviera alone.

So far as I can make out, there is no difference between ordinary *W. filifera* and that called *W. robusta*. Mr. Parish goes so far as to say that seeds of the one are made to do duty for both by collectors. Nor can I see any difference between *W. Sonora* of Sereno Watson, of which the author sent seeds to Kew in 1888, where there are now strong plants, in no way distinguishable from *W. filifera*. Of course, there are variations in such characters as the length and number of the filaments, the spines, &c., but they are not of much account, in this Palm at any rate.

The value of *W. filifera* in English gardens is not yet generally recognised. That it grows perfectly in an ordinary greenhouse temperature may be seen in the large winter garden at Kew, where there are several good examples, which have been there five years. I believe it would thrive out-of-doors in such places as Devon and Cornwall. At any rate, it is well worth trying, as it thrives in exposed situations on the Riviera, where 10° or more of frost sometimes occur. It is a Palm of exceptional interest and value, and is one of the noblest of the fan-leaved species. *W. W.*

NEW MODES OF DISPOSING OF FRUITS AND VEGETABLES.

I SUPPOSE we people on the land are to regard Mr. Charles Whitehead's amusing article, entitled the above, in the last *Journal of the Royal Agricultural Society of England*, as a strong hint to mend our ways, and a straight tip as to one of the ways of improving our positions. With all due humility, I beg to hint that a gentleman who has but little experience of trade, is not perhaps, the best teacher, that if he had on his hands 10 or 15 cwt. of assorted jams he would not know what to do with it. Mr. C. Whitehead states that an American fruit grower shuddered at our way of putting up Cherries, and suggested their being put in boxes. It would have been more to the purpose had a price been quoted for boxed fruit. Mr. Emory E. Smith, the grower referred to, would shiver at the price we get for our Cherries in some seasons when our own clash with foreign produce, or the weather is cold and wet; it would also make him feel queer if he paid the usual rail rates for small packages of English fruit. What would he think of 45s. per ton for 30 miles (South-Eastern Railway's charge from Cliffe to Covent Garden), by luggage train and rough vans? The foreign fruit comes by express, and at cheaper rates. As many Cherry orchards round Maidstone are sold by auction, why does not the writer of the article purchase one, and show how one of the new modes work in practice? No one asserts the wicker receptacle is an ideal one, but it has yet to be demonstrated that the price realised for English fruit will pay for any other. I have the account at my side of the returns of the Cherry orchard on this farm for the last seventeen years, and I know every market in London, so that I am not talking without my hook. I agree with the writer that our own systems of distribution are not perfect, but for that, our railway companies are largely to blame. I can also assure him that it is impossible for the farmer or market-gardener to vary his market at a moment's notice. In fact, I advise him as an experiment to buy 20 acres of podding Pens and a few hundred bags, just to learn why we are unwilling to try new ideas I am giving him the easiest task, as I should like to bet my "bottom dollar" that Mr. Whitehead does not know how to put up Peas in bushels for two London markets I could name, not to mention attempting to supply a dozen or so of country markets.

Then, as to evaporating fruit, &c.: if one can believe one's eyes and ears, the work is done in a large way in the United States, and the advice given could only be followed here with any degree of success by growers with very large acreages; and the same may

be said of canning and jam making. I may add that the writer seems to be unaware that Vegetable Marrows, &c., have played a large part some years in factory made jams, and glucose is known also, so that people who deal in these things are supposed to supply it in dear as well as in cheap years. The making of jam, &c., in more or less (comparatively) small quantities may answer in the United States where conditions are different; but in this country the swapping, say, of 26 lb. of Raspberry, 16 lb. of Gooseberry, and 26 lb. of Damson jam for a new wheelbarrow, would be a task that even Mr. Charles Whitehead would not want to repeat. In newly settled countries, where towns are few, it is possible to exchange one commodity for another, and the makers are known. Here, whatever is produced, must be sold in a shop, and fruit, &c., preserved, evaporated, or canned by a dozen different makers would have all the faults of our present dairy-made butter—want of uniformity. I am afraid that a factory would only be supplied on the principle of, of two evils choose the lesser. We are a thick-headed lot, and will not be taught, and I dare to say the editor of the *Journal of the Royal Agricultural Society of England* thought the article would enlighten us. It certainly is entertaining, and one can almost imagine one's self in a good old farmhouse kitchen reading Mrs. Beaton's Cookery Book, helping to make the Christmas pudding by stealing the candied peel, while perusing five pages out of the eight forming the article. Such an essay does for one of the London dailies, making pretty reading for the City man who grows Scarlet Runners to hide his garden wall at Blackheath, and who gives his surplus Beans to Jones if neighbour Brown gets tired of them; but to the intelligent market grower, with a knowledge of the markets, it is receiving a stone when expecting bread. Peas have been sold off this farm at 6d. per bushel, Beans at 9d., Cauliflowers and Cabbages at 6d. per dozen and less; bad as these prices are, I should have been sorry to send my own baskets careering over the country on the offchance of the goods selling better elsewhere, or to have tried to pickle, can, or evaporate them; and to deal with acres of produce requires an extensive plant. With hot dry weather prevailing, Peas will not wait, and when picked, they must be shelled. Two years ago, in a little over one week, nearly 900 bushels from this farm did not pay for picking and other expenses. Now, will Mr. Whitehead tell me where I could have got the hands to tin those Peas? or, how I could find out in the time better markets, to take that quantity off my hand, and it is only a small one by comparison, as I have a friend at Chertsey who thinks nothing of bringing nearly 1000 bushels of Peas to market in one day. It is one peculiarity of the present agricultural depression, that all the good advice comes from outsiders, not from those who have been in the fight and know what it is to be at their wit's end to decide what to grow, or in the equally delightful position of not knowing what to do with it when it is grown. I make the remark with all humbleness, but it is not just possible that some of our advisers are just a little out of their depth occasionally. My foreman, when he went to Mr. Whitehead's to fetch the Vermorel's horse-power vaporiser last year for me, saw an orchard extremely near that gentleman's house that to his eye looked neglected; he was a practical gardener, and had been "through the mill," and he expressed his astonishment, until I explained that probably the trees were left to themselves as an experiment; also that there was a proverb, "the nearer to church, &c." Mr. Charles Whitehead means well, and so far as jam, &c., is concerned has perhaps given good advice to capitalists; still, in regard to the marketing of garden produce he knows nothing, and his advice would only pass muster among drawing-room agriculturists and horticulturists. It would be as well for our friends to realise the fact that we do not owe all our misfortunes to want of adaptability, that we do not meet our foreign competitors on an equal footing, and that the grower who has had an awkward season to contend with has increased expenses to meet; and why, if we are so wanting in knowledge,

do the foreigners grow Tomatos, &c., from English seed, &c.? We do not want advice, but we do want better and more regular prices; and advice which is afforded would come better from those who are in the thick of the fight. *W. Whitehead Cusins.*

ROUND BIRMINGHAM.

(Continued from p. 642.)

LEAMINGTON AND NEIGHBOURHOOD.—A drive to Leamington and round about that bright and pleasant watering-place suggests the thought, that not only have its springs healing qualities, but the pure air of the district is equally beneficial. In evidence of the salubrity of the town, the clean, bright appearance of the trees of its avenues, and in the Arboretum and pleasant walks of the Jephson Gardens, were all the more striking, as we were fresh from large towns very different in the quality of the atmosphere though not so far distant. The nursery gardens in all such places are mostly devoted to plants for cut flowers or for sale in shops, and as soon as they are ready they are packed off. A look into the Lillington Nursery of Mr. Fred. Perkins disclosed the same healthy appearance in the trees and shrubs as noted in other parts of the town. The rockery in front, the stones of which are moss-grown, and covered in places with Ivy, is very pretty even at this season, when the brightness is off most things in the open garden; in summer it must be very effective.

WARWICK SCHOOL.

Here the head master, the Rev. J. P. Way, takes much interest in gardening, and especially in the culture of hardy herbaceous and alpine plants in the outdoor garden, and of Orchids in the glasshouses, and in both of these departments good success in proportion to the space allotted has been attained. The hardy plant garden has been very showy and interesting, so much so that an extension is in progress, and as the manner of carrying out the work is simple, and the result attained satisfactory, a few remarks on the subject may be useful. First, then, the form of the garden or extension is determined on, and afterwards its walks are pegged out on the level ground. The walks are then countersunk and carried through at different gradients, the soil removed being banked-up on either side, so that by the time the deeply-cut, winding, and undulating walks are finished, there only remains to put the banks and hillocks beside them in form, fit them with suitable rockery (a small amount, merely as a shelter or protection to the plants is here used) to plant and tend carefully until established. So made and planted, the hardy garden at Warwick School has been very satisfactory, and when the new extension has been finished and had time to settle down, it will be a model garden of its kind.

In the first Orchid-house, the climbing Lily (*Gloriosa superba*) and *Aristolochia elegans* were flowering on the roof, and various *Cattleyas* making a show either of flowers or buds. Among them was a singular-looking plant bought from the Liverpool Horticultural Co., and which may be the original *Cattleya Warscewiczii*. Its flowers are very large, lighter in colour than the forms of *C. gigas* usually seen, and with the lip rounder, and, indeed, more like that of a fine form of *C. Luddemanniana*. It appears to be new to gardens, and the same thing has been flowered out of an importation made by Messrs. F. Sander & Co. In the same house, in flower, were good *Laelia præstans*, *L. Dayana*, *Dendrobium Wardianum*, good, but rather out of season; *Trichopilia tortilis*, some very bright *Cattleya labiata vera*, and good *Odontoglossum grande*, *Oncidium ornithorhynchum*, *O. varicosum* Rogersii, &c., the whole very creditably grown and well arranged by Mr. Walter Rouse, the gardener here. In another house was a very good collection of *Cypripediums* of moderate size; in a cool house a good lot of *Odontoglossums*, *Masdevallias*, *Sophranitis*, &c., some of them in bloom; and in the greenhouses a large and well-grown collection of *Chrysanthemums*.

HOME CORRESPONDENCE.

GRAPE, GROS COLMAR.—In your columns of November 19, I note a reply to a correspondent, as to the proper spelling of the name of that fine Grape, Gros Colmar, or Gros Colman of some, and Gros Golman of others. With all due respect to authorities who may differ, I believe Gros Colmar is more likely to be the original and correct name than Gros Colman. The Grape was sent with others to Mr. Rivers, in November, 1849, from Mr. Vibert, of Angers; and, in the *Gardeners' Chronicle* of November 9, 1878, p. 602, Mr. T. Francis Rivera says:—"It is not at all unlikely that the clerk, in copying the invoice, mistook the French *r* for an *n*, a mistake very likely to be made." Further on, in the same communication, he says:—"Colman, as a correspondent points out, is hardly a French name, and it is very likely that the proper name is Gros Colmar." Mr. Barron, in his excellent work on the Vine, quotes Dr. Hogg, that it can be traced through Germany, where it has been for many years known as Gros Kölner; and it is of this name that the French Gros Colman, or Gros Golman, and Gros Colmar are corruptions. He also gives the authority of Herr Horvath, who remarks, "that the name 'Colman' is a corruption of the word Kölner, as stated by Dr. Hogg; but the Grosse Kölner Grape, which in German works relating to the Vine is called Bläue Urbanist Traube, is not identical with the Gros Colman, but is quite distinct." This seems to point to the fact that our Gros Colmar, or Gros Colman, is not of German origin, but French, therefore, a purely French name, is most likely to be correct. Assuming that the Grape is of French origin, the probabilities are in favour of its having been named Gros Colmar, after the town of Colmar in the Rhine Provinces, between the Rhine and the Vosges. Colmar is already a familiar name to the pomologist. In Pears, we have the names Passe Colmar, and its synonyms, Passe Colmar Doré, and Passe Colmar Gris. Then there is Passe Colmar Musque, Colmar, Colmar d'Été, and others. To anyone with even a slight knowledge of the French language, these names have the correct ring about them. With Gros Colman, Coleman, or Golman, it is different. Half-French, and half-English, the name appears to be neither good French nor good English. If you retain the English part, then Anglicise the other half, making it Great Colman; but if you retain the French word Gros, then make it French altogether, as Gros Colmar. If we retain names made up of words from different languages, it may become sanctioned by custom, but it can scarcely be correct. If Gros Colman, or Gros Golman is right, then it should be equally admissible to say, "Aut Caesar aut nobody," or, as Mr. Stelling in the *Strand Magazine* of November, facetiously remarks to his guests, "The tempus is fugiting." *Sans Peur.*

CHRYSANTHEMUMS OUT-OF-DOORS.—Those who have the above growing on walls, and as clumps in borders protected by walls and hedges, will have this mild season reaped a great harvest of beauty. In autumn, when sharp frosts have prevailed during the month of November, the results may have been good, but the duration of the flowering season has been shortened by a week or two, whereas mine are still in full bloom at this date (November 25), and might be better if the blooms were not so tempting for cutting to fill vases and flower-glasses, and there is nothing else in the garden now, if one excepts the opening blooms of the Christmas Rose, a few sad-looking Stocks and Wallflowers, and, by the way, abortive flowers of Alpine Auriculas which have hurriedly shot up a weakly truss here and there. I thin out the shoots of my Chrysanthemums to six or eight of the strongest that spring from the root, and cut these half-way back in June—about the 15th, unless they are late bloomers, and then they are not decapitated. The shoots are trained fanwise with shreds and ties, and when time can be spared, a certain amount of bud-thinning is done as soon as the buds can be seized with the point of the knife, although that is not very essential, as very nice flowers can be secured by affording the plants after the buds have appeared a weekly or bi-weekly watering with diluted house-slops. My greatest enemy is the leaf-miner, against whom a war to the knife must be waged till September, when he usually ceases from troubling. The varieties that I grow are Sunflower, Peter the Great, Madame Rendler, Meg Merrilies, Chang, Pigny, &c., and several of the fine old incurved varieties, which always do well

But the Chrysanthemum being a hardy plant, almost any variety or kind may be planted outside; and even those flowers which one would suppose were too dense, and would therefore hold moisture in large quantities, come quite lax outdoors, and last as long as the single-flowered. Chrysanthemums do well as clumps in the herbaceous border, and if they have the stems reduced in number to six or eight, they are highly decorative objects at this season. It is a pity people should think that they are only fit to grow under glass, considering how easy it is to grow them, and how well they would furnish our very bare beds and borders in November and December. *Suburbs.*

CHRYSANTHEMUMS AT BIDDICK HALL, DURHAM.—On one of the few fine days last week I had the pleasure of seeing an exceptionally good show of Chrysanthemums at the above-named place, which the cold damp summer and autumn of this year seems to have had no ill-effect upon. Mr. Scott, the gardener, showed me one batch of the plants covering an area of 200 square feet, not a single plant of which indicated poor culture. The flowers were quite a feast to look upon—all shades of colour harmoniously blended, the foliage of a deep green and leathery texture, and the flowers ranging from 5 to 11 inches in diameter, with well-developed centres. Mr. Bunn, Golden Beverley, Peter the Great, Elaine, La Triomphe, Ada Spaulding, Charlie Sharman, Golden Dragon, President Hyde, Edwin Molyneux, and many others were excellent. A number of Chrysanthemums for succeeding these were observed in the Peach-houses and vineries. *Wanderer.*

BOUVARDIA MRS. ROBERT GREEN.—This lovely variety was sent out by Mr. May a few years ago, and was awarded a First-class Certificate by the Royal Horticultural Society. It recommends itself by the great beauty of its large trusses of flowers, which are of a clear salmon-pink colour, and flowers as finely as B. Bridal Wreath, a very good variety for winter flowering, but with too little brightness in its flowers. I do not hesitate to say that amongst the coloured Bouvardias it stands first as a winter flowerer. It is much lighter in colour in winter than in summer, and for this reason it should not be kept too warm. *Maidenhair.*

THE GARDENERS' ROYAL BENEVOLENT INSTITUTION.—The time draws near for another election of pensioners for the above excellent charity. Anxious candidates are applying for votes. I should like to impress on all gardeners the desirability of joining as subscribers, so that in the future, if want should overtake them, they could boldly send in their application for the pension. Many more could do so than are now enrolled on it books by a little carefulness in some way. I have known several men, now pensioners, who little thought years ago they would need any help, but have since been thankful to receive it when distress came upon them. What a comfort if, in case of need, you may rely upon £20 a year, and should your wife survive you, she may receive £16 a year. Some of my friends say, "Vote for subscribers," that we may persuade others to subscribe, but many old and deserving applicants would thus be helpless. Having a large family myself, there were many ways for my wages, but when I mentioned the Institution to my employer, he at once gave me half, and I made up the total life-subscription. I am surprised to meet with so many who have scarcely heard of the Society. Could not we bring it by some means more and more before the eyes of the gardeners and their employers? *N. Kneller, Malshanger.*

URCEOLINA PENDULA AUREA.—If this plant had no other good qualities to recommend it than its distinct and interesting appearance when furnished with umbels of pendent flowers, they are sufficient to entitle it to be more extensively cultured than it has, apart from its uncommon appearance. It is a pretty subject, and useful as a pot-plant or for cutting purposes. Being deciduous, and flowering when bare of foliage, it is at a disadvantage compared with some others, and for this reason it is seen at its best when associated with such plants as Ferns, &c., and it can be in this way effectively employed upon rockeries, or the front of stages, &c., while it is one of the not too plentiful plants that may be placed in Orchid-houses, without appearing incongruous, and there help to enliven a dull season. Ordinary stove temperature suits it, and it grows well in a compost of peat and loam, with enough sand to keep it porous. It likes a plentiful supply of

weak liquid manure during its season of growth. Water should be gradually withheld when growth is completed, and at last it may be placed upon a shelf and kept dry until the flower-spikes begin to push. It succeeds best in 48's, which will accommodate five or six flowering bulbs. This plant belongs to a small genus, which appears to be closely allied to some others, which is evidenced by the beautiful hybrid (*Urcecharis Clibrani*), which was raised by Messrs. Clibran & Son, by crossing this species with *Eucharis grandiflora*. *T. Coomber.*

NEW TOMATO.—A variety sent out this spring under the name of *Regioa* has proved one of the best I ever had. Sown on the same day as several other kinds, it was a fortnight earlier in ripening. It is a heavy cropper, and the fruit is handsome in shape and colour. It has such a flavour that persons unable to eat ordinary varieties enjoy it. *Jas. Towler, Carleton, Skipton.*

HEELING-IN BROCCOLI.—Growers of Broccoli will have reason to remember last winter, on account of the great losses that occurred amongst Broccolis, especially in rich garden soil, where Broccoli always suffer more from frost than in fields, the soil of which is usually less rich in plant food. There can be no question but that the dwarf varieties are the hardier, and I have always found Veitch's Model superior in that respect to any other, and excellent in all respects. Cattel's Eclipse is another very hardy variety, but its being brimstone-coloured is against it for the best table. With regard to laying-in, the earlier that this is now done the better, as we cannot expect to have mild weather much longer, and any heads that are now formed run the risk of being spoiled. The better way of managing the early kinds that are now in, or turning in, is to take up all the plants, and wheel them to some sunny border or warm sheltered nook, where they can be laid tolerably close together in trenches. A little clean straw thrown over when frost is expected, or a mat or two to cover the bed will make them safe. A cold frame or pit, if either can be spared, is a good place to preserve forward Broccoli; but when so placed, plenty of air must be given. This year I have a good many in open sheds, packed closely together, and at night we haog a thick tarpaulin in front. The later ones, and those for spring use, should be heeled over, where they are growing, and any expert spadesman will do this quickly, by taking out a deep spit behind each plant and then pushing it over and burying up the stem. In doing this the earth should be brought quite up to the lower leaves, but I like to have all the plants in long continuous trenches, and I believe the work of so placing them may be carried out quicker, and by having them more together they help to shelter each other. Why Broccolis escape so much better when laid over is that besides having the stems buried, the leaves fall over the heart, and lie flat on the ground, where, as when left standing, it is a well-known fact that frost makes them hang straight down the stalks, and exposes the hearts to the full action of the weather. It is much the same if a fall of snow comes, but if the plants are in a slanting position near the earth, the snow covers them entirely up, and frost then cannot harm them. *J. Sheppard.*

ABBOTSBURY, DORSET.—The rockery, which is close on to the sea, is becoming very pretty with the different sorts of Mesembryanthemums. They astonish me, having been in bloom since last May, and are now, when the sun is out, quite a picture. They are Mesembryanthemum Eckloni, M. barbatum, M. vaginatum, M. tigrinum, M. floribundum, M. edule; the latter I have had sent me from Canoes as cuttings, 3 inches long, and now they measure 4 feet, and are growing permanently outside, as well as a host of other things, such as sweet Alyssum, *Datura fastuosa*, *Cytisus*, *Helianthemum*, *Auricula*, *Lithospermum prostratum*, *Violas*, *Valottas*, *Calendula*, &c., her ladyship being delighted with the *tout ensemble*. We have *Magnolia grandiflora* in bloom still; *Rhododendron Thomsonianum*; *R. Falconeri* is very fat with flower-buds—too much so, if we have frosts. *Schizostylis coccinea* does very well here, and we have large clumps which are all ablaze with bloom. *J. B.*

RECENT NOTICES OF GARDENS.—We beg to say there are three places of which short notices appeared recently in the *Gardeners' Chronicle*, which seem to us to deserve further some notice. At Mr. J. Chamberlains', Highbury, we constructed the ferneries, in-

side and outside, the rocky dell and the stream, waterfalls, &c. At Dawpool we constructed the fernery, inside and outside, and we may say that it is an unique piece of work, as the rock cliff planted about outside forms the wall of the front and end of the inside fernery. The rocky Fern-clad dell and the rocks joining on to the natural cliff, were built to break the force of the wind, which is so stroog there. This union of the natural with the artificial is accomplished in a manner which deceives the eye. The concrete paths consist of our "Gravelite," which I have no doubt was found as perfect as the week it was laid down, a score years ago. As to the fountain, adversely criticised as being unfit for the place, the figures with umbrella are not children of ours. One more thing, still most of our rockwork may be *Ars clare artem*, the art so concealed that it is supposed to be natural, not the work of men's hands, and therefore not so noticed, to the regret of *Pulham & Son*.

OXFORD BOTANIC GARDEN.—In the paragraph relating to this garden on p. 620 of the *Gardeners' Chronicle*, in respect to the question of the first Curator, a quotation from Ingram's *Memorials of Oxford* is made, in which the garden walls are incidentally mentioned. The statement of their completion with the archway in 1633 is perhaps more open to question than that of the appointment of the elder Tradescant to the first curatorship. According to Professor Dr. C. Daubeny, the Botanic (Physic) Garden was founded on July 25, 1632, by Heary Lord Danvers, created Lord Danby (of Cirencester), and on that day a foundation-stone of the present archway was, with some ceremony, laid by the then Vice-Chancellor. This was subsequently completed under the direction of Inigo Jones, excepting the two statues of Charles I. and II., but the commencement of the Civil Wars, it is said, interfered with progress in the erection of the massive walls, which, with the arch, involved the expenditure of a sum stated to have exceeded £5000. The death of Lord Danby occurred twelve or thirteen years after the date of the founding of the garden, at which time the walls were not completed. However, they soon contained a collection of plants that acquired a fame that, under successive Curators, has been maintained down to the present day. It is recorded that the cost of the statues referred to was defrayed from a fine imposed on Antony à Wood, the consequence of a libel. *John E. Jeffries, Oxford.*

SOCIETIES.

YEOVIL CHRYSANTHEMUM.

NOVEMBER 16.—The exhibition of Chrysanthemums, fruits, flowers, and vegetables was the best hitherto held by the Society. Groups of Chrysanthemums, together with groups of miscellaneous plants, and arranged for effect, are always a strong feature in the Yeovil shows. The 1st prize for a group of Chrysanthemums was won by Mr. A. Crossman, gr. to Jas. Brutton, Esq., Yeovil; Mr. C. Anthony, gr. to Thomas Moore, Esq., Yeovil, was a good 2nd; and Mr. Gear, gr. to B. Penny, Esq., Yeovil, was 3rd.

Out of three groups of miscellaneous plants, Mr. Biss, gr. to Jabez Bradford, Esq., Yeovil, had the best.

Plants.—Mr. Crossman was the most successful exhibitor of Chrysanthemums in pots, gaining five 1st prizes for well-trained and profusely-flowered plants. Messrs. Anthony, Appleby, and Sampson, of Bridport, also showed well.

Double and single-flowered Primulas, pot-Violets (Marie Louise), and Mignonette (Machet), six plants of each, were well shown by Messrs. Anthony, Crossman, G. Gillingham (gr. to Felix Drake, Esq., East Coker), and S. Shire (gr. to Fred. Ewens, Esq., Yeovil).

Cut blooms were shown extensively in the several classes provided for them.

There were seven good stands of thirty-six Japanese, in not fewer than twenty-four varieties, staged in competition for the Silver Cup, or £5. Mr. William Iggulden, gr. to the Earl of Cork, Marston House, Frome, was 1st, winning by eleven points with uniformly fine blooms; Mr. Crossman was 2nd. Mr. Iggulden was also 1st for twelve blooms of Japanese, distinct.

Mr. Copp was well ahead in the class for eighteen incurved, in not less than twelve varieties, staging moderately large blooms, of fine depth, even in size, and fresh.

To Mr. A. Crossman was awarded all the three Certificates of Merit offered by the National Chrysanthemum Society for the best group of Chrysanthemums, the best specimen plants, and the best cut bloom.

Fruit was well shown throughout, judiciously-arranged classes being open for Grapes, Apples, Pears, &c., some of which were confined to tenant farmers. Many honorary exhibits (which the pressure upon our space forbids us to note) adding much to the effect of a thoroughly good autumn exhibition.

TUNBRIDGE WELLS AND DISTRICT CHRYSANTHEMUM.

NOVEMBER 16, 17.—The competition in plants was not very spirited, but those presented were put up in good condition.

For a group of Chrysanthemums arranged for effect, Mr. Scammell, gr. to C. Reily, Esq., The Priory, Nevill Park, was easily 1st. The groups were all arranged in the stereotyped manner, but the quality of the flowers was good.

Miscellaneous groups are always interesting at Chrysanthemum exhibitions. The 1st prize in this instance went to Mr. L. Dupond, gr. to C. B. Powell, Esq., Old Hall, Southborough; Mr. W. Wikens, gr. to J. Wheelwright, Esq., Nevill Park, Tunbridge Wells, was a good 2nd.

Mr. J. Tickner, gr. to W. Gridley, Esq., 4, Broadwater Down, exhibited very good trained Japanese. Mr. Smooker had the best trained pyramids.

Cut blooms in the incurved class were not perhaps up to the average of those exhibited here. Mr. J. R. Heusman, gr. to Mrs. Oxley, Fern Place, Turner's Hill, Worth, had the best blooms, winning 1st prizes for twenty-four and twelve.

There was a good competition for Japanese blooms, Mr. Heusman winning easily again in the classes for twenty-four and twelve.

In other classes there was a good competition, the blooms being very good in some cases. Mr. J. Tickner and Mr. G. Tickner both exhibited well in miscellaneous plants. Mr. J. Tickner exhibited excellent single Chinese Primroses; the best double varieties were sent by Mr. G. Tickner. Celosias and Poinsettias were well shown by Mr. Smooker.

Vegetables in collections made an admirable display, the quality being very good indeed.

Fruit was a principal feature in the show. Black Grapes were of good colour, and some of them were well finished; and there was an admirable collection of hardy fruits of first quality.

HULL CHRYSANTHEMUM SHOW.

NOVEMBER 16, 17.—The usual show of Chrysanthemums was held on the above dates. It is an event which evokes much interest amongst the growers in the North, and is looked forward to with a sense of delight by the inhabitants of Hull and neighbourhood; moreover, it has shown wonderful vitality and progress under the management of the able chairman, Mr. P. Falconer Jameson, a widely-known amateur. The show was a remarkable one, for nowhere else are found such fine groups of Chrysanthemums, or such mixed groups, or such general good quality. Our reporter states that a distinct advance upon previous years was remarked in the cut blooms. The large hall at the artillery barracks was the scene of the friendly contest, and here the groups were arranged in the centre, and the cut blooms on benches at the sides.

For the best group, a Challenge Cup of twenty guineas value, the gift of G. Bohn, Esq., and money in addition, were awarded to Mr. G. Wilson, gr. to J. Rockett, Esq., Swanland Manor, Brough. The winner having won the cup on two previous occasions it now becomes his. The plants of which the group consisted were good specimens of cultivation, and they were put together with lightness and good taste; the 2nd prizewinner for a group was Mr. J. Coates, gr. to W. Wheatley, Esq., Hull, whose group was a very good one; 3rd, Mr. G. Cottam, Alma Gardens, Cottingham.

Specimen plants are much encouraged, and these were in considerable numbers.

For six bush-grown but not formally trained plants, 1st, Mr. Goodhill, 32, Stanley Street, Hull; and 2nd, Mr. H. Taylor, gr., Newland, Hull.

Mr. J. Henning, gr. to E. Leatham, Esq., Beechholme, Newland, Hull, was 1st for three trained specimens, with good plants of the Rundle type; and 2nd, Mr. R. Thirsk, Grove Hill Road, Beverley;

Mr. Henning had also the best standard trained plants, and the best pyramids.

There was a class for six cut-back plants, put in with a view to encouraging the growth of dwarfish plants, and there were no fewer than nine entries, which, as a whole, made a fine display. Mr. G. Coates was 1st in this class, with plants about 3 feet high, carrying fine blooms and excellent foliage; Mr. G. Wilson was 2nd.

Cut blooms were numerous, there being no fewer than fourteen entries in the twenty-four class of incurved varieties. Mr. A. Coombes, gr. to Earl Dudley, Himley Hall, Dudley, was 1st, with leading varieties; 2nd, Mr. H. Shoesmith, gr. to M. Hodgson, Esq., Shirley Lodge, Croydon, with fresh blooms, a trifle smaller than those which won the 1st prize; 3rd, Mr. J. Myers, gr. to Earl Sandwich, Hinchingsbrook Castle, Huntingdon. The first two named exhibitors occupied similar positions in the competition for twelve incurved.

The competition was very strong in Japanese, no fewer than ten persons competing for the Silver Cup and money prize offered for twenty-four distinct varieties. Mr. Myers with some really very fresh blooms just succeeded in getting into the first place; Mr. G. S. Musk, gr. to Lord de Ramsey, Haverland Hall, Norwich, being his close antagonist.

Mr. D. Heaney, gr. to H. G. Schintz, Esq., Mossley Hill, Liverpool, had a strong lot of blooms in the twelve varieties class; and Mr. Musk was 2nd.

Mr. Heaney and Mr. Shoesmith secured 1st and 2nd prizes in the order of their names for twelve blooms, all to be white. The nine who competed in this class made a fine display.

The prizes for six bunches of three blooms each of the "Rundle" family, were taken by Mr. Wells, Earlswood Nurseries, Redhill, Surrey, 1st; and Mr. G. E. Smith, Paull, 2nd.

Anemone varieties were well shown. In the class for twelve, Mr. W. B. Davidson, gr. to R. Jameson, Esq., East Ella, Hull, was undeniably 1st, and Mr. G. Burrows, gr. to Sir H. Bennett, Westlands, Grimsby, 2nd.

Mr. Myers won 1st, for twelve reflexed varieties, with leading varieties. Mr. G. Smith won in the classes for both Pompon and single-flowered varieties, with creditable stands.

Numerous classes were provided for residents by the town, the chief prize-winners being Mr. D. Wilson, Park House, Cottingham; Mr. C. H. Johnson, Thorgumbald, Hull; Mr. R. Jameson, and Mr. H. Witty, the Wellingtonians, Hull. Amateurs mustered in great numbers, and their exhibits of cut blooms filled one side of the saloon. Mr. W. Gillett, Mr. J. W. Beanpark, Mr. W. H. Clark, and Mr. A. W. Stanley showing well.

The premier Japanese bloom was decided to be one of Viviani Morel in Mr. Musk's stand of twelve Japanese, and the finest incurved was a golden Queen of England in Mr. Myers' stand.

The Silver Medal offered by the proprietors of the *Gardeners' Magazine* was awarded to Mr. Coombes for his stand of twenty-four incurved varieties.

First-class Certificates were awarded to Mr. Molyneux, gr. to W. H. Myers, Esq., Swanmore Park, Bishop's Waltham, for Chrysanthemum Mrs. Mitchell, a buff sport with a purple shade obtained from Empress Eugénie; to Mr. Cannell for Lord Brooke; to Messrs. Pitcher and Manda for the same variety, and also to The Tribune, a promising seedling of a yellow colour; to Mr. Newbould, gr. to H. Jacobs, Esq., Rawdon, Leeds, for Mrs. Jacobs, a bronze sport from Madame Baco.

NEATH CHRYSANTHEMUM SHOW.

NOVEMBER 17.—A most successful show rewarded the efforts of this young society, the quantity and quality of the various exhibits being altogether satisfactory. The following are some of the chief prize-winners.

For twenty-four blooms, twelve incurved and twelve Japanese, Mr. Milner, gr. to Miss Talbot, Penrice, Swansea, 1st; Mr. R. C. Williams, gr. to the Right Hon. Earl of Lisburne, Crosswood Park, 2nd. Mr. Milner, 1st for twelve Japanese, distinct; Mr. Clevee, gr. to J. H. Rogers, Esq., Llanelly, 2nd; and Mr. Williams, 3rd.

For twelve incurved, distinct, Mr. Williams was placed 1st with a splendid board; Mr. Milner taking 2nd. Mr. Williams took similar honours, too, for twelve incurved, distinct, in a class open to South Wales. Mr. Watts, gr. to Mrs. Gwyn, Dyffryn, Neath, being 2nd.

For twelve Japanese in this class, Mr. Harding,

gr. to Mr. Gough, of Yngscedwyn, was 1st; Mr. Clevee, 2nd; and Mr. Milner, 3rd.

For twelve blooms, six incurved and six Japanese, Mr. Clevee was placed 1st; Mr. Williams and Mr. Milner 2nd and 3rd. Mr. Milner was awarded 1st for best bloom in the show, staging a splendid bloom of John Lambert. Mr. Williams had the best three blooms of Mrs. Clibran, a good incurved; and Mr. Clevee the best six blooms of any one variety.

Mr. Watts, The Dyffryn, led in groups, being 1st for miscellaneous group, and for group of Chrysanthemums; Mr. Smith, gr. to H. H. Price, Esq., following 2nd, and also taking 1st for trained plants.

Mr. Milner, as might be expected, staged excellent vegetables, his two 1st prize collections in two classes containing exceedingly fine dishes of kitchen garden products; Mr. Croft, gr. to Mrs. Palmer, Rheola, staged a very even 2nd prize collection in the open; Mr. Clevee taking 3rd. Mr. Croft was a good 1st with collection of Potatoes.

Mr. Clevee won with collection of fruit, and Mr. Croft took 2nd.

Bouquets and other floral arrangements were largely staged for competition; and also as honorary exhibits by the local trade; and in addition, Messrs. W. Clibran & Son, of Altrincham, staged several stands of Chrysanthemums, and a very fine collection of hardy fruit.

NORWICH CHRYSANTHEMUM.

NOVEMBER 17, 18.—In St. Andrew's Hall the annual autumn exhibition was, in every way, a success, the exhibits being numerous, and the quality good. The cut blooms were arranged on tables in the middle of the hall, with small plants down the centre of each. To Norwich belongs the honour of holding the first Chrysanthemum exhibition in England, which took place in 1829.

Cut blooms were the most important part of the show. For forty-eight distinct, half incurved, and the rest Japanese, Mr. Gilbert, gr. to B. Le Neve Foster, Esq., Sennowe Hall, Norwich, was 1st; and Mr. Sheddeck, gr. to the Hon. A. F. Fellowes, Honningham Hall, Norwich, 2nd.

Japanese were best shown by Mr. Gilbert, who also took premier award for twenty-four and twelve distinct. Mr. Atkinson, gr. to E. S. Trafford, Esq., Wroxham Hall, was 2nd in the larger class. Mr. Musk, gr. to Lord de Ramsey, Haverland Hall, Norwich, occupied a similar position in the minor class.

With Viviani Morel, in good condition, Mr. Atkinson secured 1st prize for six, any one variety.

Mr. Gilbert followed up his previous successes by taking first honours in the classes for twenty-four, twelve, and six, one variety incurved, in all cases staging creditable blooms.

Mr. Gilbert won 1st prize for six Anemone, six Japanese Anemone, twelve Pompon, and six Anemone Pompons, in all cases showing finely-developed blooms. To this exhibitor was also awarded the Silver Medals of the National Chrysanthemum Society for premier blooms in the incurved and the Japanese section, also two Certificates given by the National Chrysanthemum Society for cultural merit.

Plants were not shown in large numbers, but of fairly good quality. For six incurved, Mr. Bolton, gr. to J. G. Snelling, Esq., Eaton Hall, Norwich, was 1st, and also 1st for six Japanese with freely-flowered plants.

Mr. Woodhouse was 1st for six Pompons and the same number of reflexed.

There were also classes for Orchids, Primulas, fruit, and vegetables.

NATIONAL CHRYSANTHEMUM.

NOVEMBER 23.—If any evidence were necessary to show the lateness of the Chrysanthemum bloom this season, it was seen in the number of finely-developed blooms at the above meeting, nearly one hundred varieties being sent for consideration. First-class Certificates were awarded to Mr. E. Molyneux, Swanmore Park Gardens, for incurved Mrs. Mitchell, a white sport from Empress Eugénie, having the fine build, outline, and petal of its type; to Mr. Owen, nurseryman, Maidenhead, for incurved Japanese Waban, a large pale pink, broad petalled variety, with a silvery reverse, extra fine; also for Robert Owen, a very fine incurved variety, but not equal to its possibilities, owing to the flowers having been taken from late-propagated plants; the base of the flower is bronze, with orange and gold centre. This

variety fully maintains the high estimate formed of it when exhibited for the first time in 1891; and to Japanese Mrs. Bruce Findlay, a large pale blush variety, very pretty, and nicely fringed. To Messrs. H. Cannell & Sons, nurserymen, Swanley, for Kentish Yellow, a large broad-petalled reflexed Japanese in the way of Tribune, but darker in colour, and very promising. To Messrs. Pitcher & Manda, American Nursery, Hextable, Swanley, for Japanese Primrose League, a large white reflexed Japanese, with a primrose base, quite distinct from Florence Davis, being of a different tint.

Beauté de Toulonsaine, crimson with deep buff reverse, an incurved Japanese, is very promising; it came from Messrs. H. Cannell & Sons. From Mr. E. Rowbottom, the Priory Gardens, Hornsey, came Pompon Harry Hicks, having a pale lilac-pink

Obituary.

JOHN DOWNIE.—It is with deep regret that we record the death of one of Scotland's most esteemed horticulturists, which occurred on Friday morning, November 25. On Tuesday, November 29, his remains were interred in the Grange Cemetery, Edinburgh, in presence of a large concourse of sorrowing friends who were deeply moved at being bereft of an estimable friend and one respected and trusted by all classes of the community. Whether in a business or social capacity, he was to all the same courteous "John Downie." Most of the leading nurserymen and seedsmen from and around Edinburgh were present at the funeral, as well as many of the leading gardeners, who came regardless

Sons have for a number of years been a separate firm, and Mr. Laing has migrated to Forest Hill. Being one of those pawky, shrewd and industrious Scotchmen (said by some not to be now so plentiful as in years gone by), Mr. Downie attained a high position as a man of business, and was often employed by leading proprietors to give advice in beautifying and improving their property. As a landscape gardener he had much experience, and in many fine seats examples of his knowledge and good taste may be seen. His association with horticultural literature, his interest in the Royal Caledonian Horticultural Society and in the Scottish Horticultural Association, of which he was one of the founders, his readiness to assist gardeners and all who loved gardening, made the name of John Downie for many years one of the best known and most revered among Scottish horticulturists.

THE LATE JOHN DOWNIE.

base, and a lighter centre, a seedling of 1891, large as shown, but the committee wished to see it again. An Anemone-flowered variety, named Garnet, from the same exhibitor, bright amaranth-red and silver, is very promising. Incurved Japanese Mrs. Walter Cutting, silvery-pink, was commended for its promising appearance. Mr. H. Shoemith, gr., The Cottage, Shirley, Croydon, had blooms of two incurved varieties, viz., Flora McDonald, very like Jeanne d'Arc, but with a delicate sulphur-tinted centre; and Richard Parker, which was sent for comparison with Misa M. A. Haggas, and differing but very slightly from it. Tribune, a large pale yellow Japanese, from Messrs. Pitcher & Manda, was commended.

From Mr. J. P. Kendall, The Gardens, Templeton House, Roehampton, came flowering branches of *Ruellia macrantha*, to show its value as a plant for winter-flowering. It is grown by Mr. Kendall in an intermediate-house; the leafage is ample, and the Campanula-like flowers are of a pretty mauve-lilac colour. It appears to be a plant well deserving of a much larger culture. It is propagated by cuttings taken in April and May.

of the storm of wind and rain, to show their deep respect to one whose wisdom on all matters horticultural, whose urbanity, and integrity, endeared him to so many of his race—not only in and around Edinburgh, but throughout a great portion of Britain. His great knowledge of florists' flowers (which he laboured most assiduously to improve, and disseminate a knowledge of) rendered his services of much request as a judge in whom exhibitors had the utmost confidence. He was the originator of the now popular race of fancy Pansies, first exhibited in London in 1858. It was not in florists' flowers alone that his knowledge and ability were conspicuous, but in every branch of horticulture. Mr. Downie served his apprenticeship at Canaan House, Edinburgh, and succeeded his father as head gardener at South Bank, Edinburgh.

For more than fifty years Mr. Downie had been in business as a successful nurseryman and seedman, many years as a partner in the well-remembered firm of Downie, Laird & Laing. Messrs. Laird &

He took great interest in technical education, indeed in any scheme having for its object the welfare of gardeners. For our own parts we have lost a valuable friend and a wise counsellor, to whom we were often indebted for advice and assistance in matters relating to Scottish horticulture. The seed trade at 111, Princes Street, Edinburgh, and the nurseries at Beechill, Murrayfield, are, we learn, to be carried on under the same able management which has characterised them heretofore. Mr. Downie has left a widow, two daughters, and a son to mourn his loss. The latter, who is to assume the head of the firm, is finishing an education which has been preparing him to successfully conduct a business, which it is hoped, will retain the high repute which it attained under his father.

TRADE NOTICES.

Mr. THOMAS GODFREY, who was formerly manager of Mr. Wm. Whiteley's Hillingdon Nurseries, has taken over the lease, goodwill, and valuable stock

of plants, &c., of the late Mr. Charles Edmonds, Hillingdon.

The business of Nurserymen, Seedsmen and Florists, formerly carried on under the title of V. DÖPFLEB, Erfurt, Germany, will in future be carried on as heretofore under the title of JOHN & ED. DÖPFLEB.

THE WEATHER.

[BY the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

Table with columns for DISTRICTS, TEMPERATURE (Accumulated, Day-deg.), RAINFALL (Inch, Ins.), and BRIGHT SUN. Includes rows for districts 0 through 10.

The districts indicated by number in the first column are the following:— 0, Scotland, N. Principal Wheat-producing Districts—

THE PAST WEEK.

The following summary record of the weather for the week ending November 26, is furnished from the Meteorological Office:—

"The weather during this period was exceedingly dull and gloomy in all parts of the kingdom, excepting the extreme north of Scotland; a good deal of mist or fog was reported. Not much rain fell over Great Britain, but in the extreme south of Ireland the fall was very heavy and persistent.

"The temperature scarcely differed from the normal over Scotland and the greater part of England; but, in 'England, S.W.,' the 'Channel Islands,' and 'Ireland,' it was 3° or 4° in excess. The highest of the maxima were recorded on the 26th, and ranged from 57° in 'England, S.,' to 50° in 'England, E.,' and the 'Midland Counties.'

"The rainfall was more than twice the mean amount in 'Ireland, S.,' and still larger in some parts of the district; but, in all other districts there was a deficit.

"The bright sunshine exceeded the mean for the time of year in 'Scotland, N.,' in all other districts it was considerably less. The percentage of the possible duration ranged from 22 in 'Scotland, N.,' and from 16 in the 'Channel Islands,' to only 3 in the 'Midland Counties' and 'England, S.W.,' to 1 in 'England, E.,' and to less than 0.5 in 'England, N.E.'"

MARKETS.

COVENT GARDEN, December 1.

[We cannot accept any editorial responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they fluctuate, not only from day to day, but often several times in one day. Ed.]

MARKET very dull with good supplies, and prices unaltered. James Webber, Wholesale Apple Market.

FRUIT.—AVERAGE WHOLESALE PRICES.

Table listing fruit prices: Apples, p. half-sieve 0-3 6; Melons, each ... 0 6-1 3; Nova Scotia, Pine-apples, St. Michael ... 4 0-6 0; Cobs, per 100 lb. ... 100 0 102 6; Oranges, Florida, per case... 14 0-18 0; Grapes, per lb. ... 0 6-2 0; Lemons, per case ... 15 0-35 0.

PLANTS IN POTS.—AVERAGE WHOLESALE PRICES.

Table listing plant prices: Adiantum, per doz. 6 0-12 0; Ferns, various, doz. 4 0-9 0; Aspidistra, per doz. 15 0-30 0; Ficus elastica, each 1 6-7 6; Begonia, per doz. 6 0-12 0; Heliotrope, per doz. 3 0-6 0; Chrysanthemums, p. doz. 4 0-12 0; Marguerite, per doz. 6 0-12 0; large plants, ea. 1 6-2 6; Palm, various, each 2 0-10 0; Cyclamen, doz. 9 0-18 0; specim., each 10 6-84 0; Cyperus, per dozen 4 0-10 0; Pelargoniums, scarlet, p. doz. 4 0-6 0; Dracaena, each 1 0-5 0; Solanums, per doz. 9 0-12 0; Erica, various, doz. 9 0-18 0.

CUT FLOWERS.—AVERAGE WHOLESALE PRICES.

Table listing cut flower prices: Arum, per doz. bl. ... 4 0-6 0; Mignonette, 12 bun. 3 0-6 0; Bouvardias, per bun. 0 9 1 0; Narciss (Paper-white) French, doz. bun. 1 6-3 0; Carnations, 12 blms. 1 0-3 0; Pelargonium, scarlet, per 12 bunches ... 5 0-8 0; Chrysanthemums, p. doz. blooms 1 6-6 0; bunches ... 5 0-8 0; p. doz. bunches 4 0 10 0; 12 sprays ... 0 9-1 0; Cyclamen, doz. blms. 0 3-0 6; Poinsettias, per doz. blooms 4 0 9 0; Eucharis, per dozen 3 0-6 0; Pr mula, double ... 0 6-0 9; Gardenia, per dozen 2 0-4 0; Pyrethrum ... 2 0-4 0; Heliotrope, per doz. sprays ... 0 6 0 9; Hyacinth, Roman, doz. sprays 0 6-1 0; Roses, Te, per dozen 1 0-2 0; colored, dozen 1 6-3 0; Lilac, white French, per bunch 5 0-6 0; yellow (Maréchal), per doz. 3 0-6 0; Lilium Harrisii, doz. 8 0-10 0; red, per dozen ... 1 0-2 0; various, doz. ... 2 0-4 0; (French) p. doz. 1 6-4 0; Lily of the Valley, doz. sprays 4 0-9 0; Stephanotis, per 12 sprays 6 0-8 0; Maiden Hair Fern, 12 bunches ... 4 0-8 0; Tuberoses, 12 blms. 0 3-0 9; Marguerite, per doz. bunches ... 3 0-4 0; Violets, Parme-French per bunch 3 0-4 6; Mimosa, French, bun. 1 0-2 0; Czar, French, per bunch 2 0-2 6; Orchids:—small French, p. doz. bunches 1 6-2 0; Cattleya, 12 blms. 6 0-12 0; small English, p. doz. bunches 1 6-2 0; Odontoglossum crispum, 12 blms. 2 0-6 0; small English, p. doz. bunches 1 6-2 0.

ORCHID-BLOOM IN VARIETY.

VEGETABLES.—AVERAGE RETAIL PRICES.

Table listing vegetable prices: Artichokes Globe, ea. 0 4-0 6; Mushrooms, punnet 2 0-; Beans, French, lb. ... 1 0-1 6; Mustard and Cress, punnet ... 0 4-; Beet, red, per dozen 2 0-3 0; Parsley per bunch ... 0 3-0 6; Carrots, per bunch ... 0 4-0 6; Sealale, per basket ... 2 6-; Cauliflowers, each ... 0 3-0 6; Shallots, per lb. ... 0 6-; Cucumbers, each ... 0 4-0 8; Spinach, per bushel 3 6-; Endive, per dozen ... 2 0-3 0; Tomatoes, per lb. ... 0 6-1 0; Herbs, per bunch ... 0 8-1 0; Turnips, per bunch ... 0 4-0 6; Lettuces, per doz. ... 1 6-2 0.

POTATOS.

Market still continues very firm for best samples, at prices from 80s. to 90s. Owing to the large arrivals of foreign Potatoes, which are of fair quality, it tends to keep the prices low of our home-grown ordinary sorts; in fact, they are a drag even at the low prices they are being sold at. J. B. Thomas.

SEEDS.

LONDON: Nov. 30.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maize Pond, Borough, London, S.E., write that, as is usual at this time of the year, to-day's seed market was thinly attended, with but little business doing. For American Red, cable quotations come strong. French and German Clover seeds are held at prohibitively high rates. There is no change this week in either Alsike, White, or Trefoil. Rye-grasses are firm. For Turkish Canary Seed, Liverpool asks, 75s. per qr. Hemp Seed is scarce and dear. Mustard, both white and brown, continues in active request. Low rates still prevail for Rape Seed. Blue Peas and Haricot Beans move off slowly. Linseed, Buckwheat, and Millet are without feature.

FRUITS AND VEGETABLES.

SPITALFIELDS: Nov. 29.—Quotations:—Seakale, 1s. to 1s. 6d. per punnet; Curly Kale, 1s. 2d. to 1s. 6d. do.; Spinach, 1s. 3d. to 1s. 6d. per bushel; Cabbage, 2s. to 2s. 6d.; Savoy, 2s. to 4s.; Cauliflowers, 4s. to 6s. per tally; Brussels Sprouts, 1s. to 1s. 3d. per half-sieve; Turnips, 1s. 6d. to 2s.; Carrots, 2s. to 3s.; Parsley, 1s. to 2s. per dozen bunches; Parsnips, 4d. to 8d.; Cos Lettuces, 6d. to 1s. per score; Carrots, 50s. to 60s. per ton; Endive, 6d. to 9d.; Leeks, 1s. 6d. to 2s.; frame Cu-

cumbers, 3s. to 6s.; Beetroots, 1s. to 1s. 6d.; Cabbage Lettuces, 6d. to 8d. per dozen; Mustard and Cress, 2s. per dozen baskets; English Onions, 5s. to 5s. 6d. per cwt.; Bordeaux do., 3s. to 4s. do.; Spanish do., 5s. to 8s. per case; Belgian and Dutch Onions, 4s. to 5s. per bag of 110 lb.; Celery, 9d. to 1s. 3d.; Horseradish, 1s. 3d. to 1s. 6d. per bundle; English Apples, 2s. 6d. to 6s. per bushel; American Apples, 10s. to 16s. per barrel; English Tomatoes, 2s. 6d. to 5s. per peck; foreign do., 1s. to 1s. 6d. per box; Almonds, 45s. to 50s.; Chestnuts, 6s. 6d. to 10s. 6d. per bag.

BOROUGH: Nov. 29.—Quotations:—Cabbages, 2s. to 2s. 6d. per tally; Cauliflowers, 9d. to 1s. 3d. per dozen; Spinach, 1s. to 1s. 6d. per bushel; Brussels Sprouts, 1s. to 1s. 3d. per half-sieve; Carrots, 2s. 6d.; Turnips, 1s. 6d.; Parsley, 1s. 6d. per dozen bunches; English Onions, 6s. to 6s. 6d.; Dutch do., 4s. 6d. per cwt.; Horseradish, 2s. to 2s. 3d.; and foreign do., 1s. 6d. per bundle; English Apples, 2s. 6d. to 10s. per bushel.

STRATFORD: Nov. 29.—The supplies to this market have been excellent during the past week, and, with a large attendance of buyers, a brisk trade was done at the undermentioned quotations:—Cabbages, 2s. to 3s. 6d. per tally; Savoy, 2s. 6d. to 4s. do.; Greens, 9d. to 1s. 3d. per sieve; do., 1s. to 1s. 6d. per dozen; Brussels Sprouts, 1s. to 1s. 6d. per half-sieve; do., 1s. 6d. to 2s. per flat; Cauliflowers, 6d. to 1s. per dozen; do., 2s. 6d. to 4s. 6d. per tally; Celery, 9d. to 1s. 2d. per roll; Horseradish, 1s. to 1s. 9d. per bundle; Turnips, 1s. 6d. to 2s. per dozen bunches; do., 25s. to 40s. per ton; Carrots, household, 40s. to 50s. per ton; do., cattle-feeding, 28s. to 35s. per ton; Parsnips, 55s. to 60s. per ton; Mangolds, 16s. to 18s. per ton; Swedes, 16s. to 21s. per ton; Onions, English, 100s. to 120s. per ton; do., Dutch, 3s. 6d. to 4s. per bag; Apples, English, 2s. 3d. to 5s. 6d. per bushel; do., American, 12s. to 20s. per barrel.

FARRINGTON: Dec. 1.—Quotations:—Beetroots, 1s. 6d. to 2s. per bushel; Horseradish, 1s. 6d. to 1s. 8d. per bundle; Cauliflowers, 3s. to 4s. per tally; Celery, 7s. to 8s. per dozen; English Onions, 7s. per cwt.; Spanish do., 5s. 6d. to 6s. per case; Carrots, 2s. 6d. per cwt.; Turnips, 2s. 6d. do; Almena Grapes, 12s. to 15s. per box; Baldwin's (Avenae) Apples, 14s. to 15s. per barrel; English Apples, 3s. 6d. per basket; Bleheims, 5s. to 7s. per bushel.

POTATOS.

BOROUGH: Nov. 29.—Quotations:—English Magnums, 55s. to 65s.; Snowdrops, 60s. to 70s.; Hebrons, 60s. to 68s. per ton.

SPITALFIELDS: Nov. 29.—Quotations:—German Magnums, 2s. 6d. to 3s. per bag; Magnums, 50s. to 80s.; Regents, 50s. to 60s.; Champions, 45s. to 60s.; Imperators, 50s. to 70s. per ton.

STRATFORD: Nov. 29.—Quotations:—Magnum, 45s. to 65s.; Imperators, 55s. to 65s.; Main Crop, 70s. to 80s. per ton.

FARRINGTON, Dec. 1.—Lincoln Magnums, 80s. to 85s.; Fremou, do., 80s to 85s.; Bedford, do., 60s. to 65s.; Grace, do., 90s. to 100s. per ton.

GENERAL AVERAGES: Nov. 30.—Hebrons, 60s. to 75s.; Magnums, 55s. to 70s.; Snowdrops, 60s. to 80s.; Imperators, 70s. to 80s.; Regents, 50s. to 65s.; Champions, 45s. to 65s. per ton.

HAY.

Averages.—The following are the averages of the prices at the principal metropolitan markets during the past week:—Clover, prime, 80s. to 105s.; do., inferior, 50s. to 75s.; hay, best, 75s. to 112s.; do., inferior, 45s. to 65s.; and straw, 23s. to 44s. per load.

CORN.

Averages.—Official statement of the average prices of British corn, imperial measure (quarter) for the week ending November 25, and for the corresponding period last year:—1892: Wheat, 27s. 5d.; Barley, 26s. 1d.; Oats, 17s. 7d. 1891: Wheat, 39s. 1d.; Barley, 30s. 11d.; Oats, 22s. 11d.

NOTICES TO CORRESPONDENTS.

** PHOTOGRAPHS, DRAWINGS, OR SPECIMENS.—We shall be pleased to receive from our Correspondents notes relating to interesting Gardens, together with Specimens or Illustrations of interesting Plants. Although circumstances prevent us in all cases from reproducing them, we are nevertheless glad to receive them, and as far as possible to utilise them for the benefit of readers.

ADVERTISEMENTS ABROAD: W. J. G. The Gardeners' Chronicle has a large foreign circulation. You will find a list of foreign nurserymen in the Garden Annual, published at 37, Southampton Street, Strand, W.C.; and a list of American journals is given in our columns at the beginning of each year.

ARISTOLOCHIA: H. P. The photograph you send represents, probably, A. gigas. We do not know of any species with the name you mention. You do not state what size the flowers are.

BOOKS: *Baroda*. You should get *Domestic Floriculture*, by F. W. Burbidge (W. Blackwood & Sons, Edinburgh and London). It is the best book on the subject you desire information upon.—*An Old Subscriber*. You will probably find all the information that you require in *Greenhouse and Stove Plants*, by Thomas Baines (London: John Murray, Albemarle Street); and *Choice Stove and Greenhouse Plants*, third edition, by B. S. Williams, Victoria and Paradise Nurseries. Published at same place.

CHRYSANTHEMUMS AT EDINBURGH: *J. D. K., Dundee*. Your enquiry should have been addressed to the Society.

DRESSING FOR PEACHES INFESTED WITH SCALE: *G. H.* Petroleum emulsion as sold by nurserymen and florists, or the old-fashioned smothering remedy of soot, clay, cow dung, and sulphur, mixed in a little water to the consistency of paint. This should be used as soon as the trees are pruned. Gishurst soap, at the rate of 4 oz. to the gallon of water, is another safe winter dressing which may be used at dead of winter, never after the envelopes of the buds have begun to burst.

LILIA GOULDIANA: *Florence*. See Rehb. f., in the *Gardeners' Chronicle*, January 14, 1883; *Orchid Album*, t. 371 (coloured figure).

LILY OF THE VALLEY IN POTS, &c.: *Janet*. No harm will come to your Lily of the Valley out-of-doors, if the pots are plunged to the rims in coal-ashes, Cocoa-nut refuse, or fine gravel. The Hyacinths have probably pushed abortive flower-spikes, owing to your having allowed the soil to become dry. The pots would do the best if placed in a damp cellar away from the light, or buried deeply in coal ashes out-of-doors—the best place for them till they have pushed above the soil to a height of 3 inches; and then, if on turning out a potful, the roots are seen to be in good quantity pushing through the mould, place them in the light (partial at first). If roots are not plentiful, return the plants to darkness for a time.

MUSHROOM SPAWN: *H. V.* The stuff sent resembles Mushroom spawn, as supplied by dealers. To ascertain if "spawn" has vitality, it must be placed in a bed made up of stable-dung properly sweetened and mixed together, and which has a steady temperature of 80° to 90°.

NAMES OF FRUITS: *W. R.* (426). Pitmaston Duchess.—*B. A.* Your Pears may be Marie Louise, as you suggest, but they were so badly bruised when they arrived that we cannot be certain.—*C. W. S.* 1, not identified; 2, Pear Beurré Clairgean.—*E. S. H.* 1, Cellini; 2, Golden Winter Pearmain; 6, King of the Pippins; 7, Braddick's Nonpareil; others, which were much bruised, cannot be recognised.—*R. M.* Pear Duchesse d'Angoulême.—*A. C. I.* Yorkshire Greening; 2, Waltham Abbey Seedling; 3, Stone's.—*C. K.* Doyenné Gris.

NAMES OF PLANTS: *J. M. K.* One of the best varieties of Japanese Persimmon or Diospyros Kaki we have tasted. The fruit is good if bletted like a Medlar. A similar one was figured in *Gardeners' Chronicle*, February 7, 1891, p. 171.—*A Constant Reader*. 1, Probably Cyrtopodium. How can you expect name without flowers? 2, Oacidium O'Brienianum; 3, Lygodium scandens; 4, Morea sp.: send flowers; 5, Polypodium trichodes cristatum; 6, Onychium japonicum; 7, Davallia platyptera; 8, Gymnogramma japonica.—*J. L.* Maxillaria picta.—*Erica*. Not Encomis, but Hippeastrum calyphatum. 1, Pteris (Doryopteris) palmata; 2, P. geraniifolia; 3, P. hastata; 4, P. adiantoides; 5, Anemia Phyllitidea; 6, Adiantum Waltoni; 8, Gymnogramma ochracea; 10, Onychium japonicum. The Silver Fern is Gymnogramma tartarea, and the other Adiantum a form of A. capillus-veneris. Some numbers were illegible.—*Cyprus*. 1, Adiantum concinnum latum; 2, A. Pacotii; 3, Selaginella Wildenowii; 4, Dendrobium Findlayianum; 5, Probably small leaves of Dracæna Shepherdii; 6, Dracæna, not possible to name from leaf sent; 7, Begonia insignis.—*H. H.* 2, Dracæna Baptistei; 3, D. nigro-rubra; 5, D. ferrea; 6, Gymnogramma japonica; 7, Raphiolepis ovata; 9, Phenocoma prolifera Barnesii; 10, Polygala Dalmaisiana; 12, Eulalia variegata—others not recognisable without flowers.—*C. K.* Euonymus europæus.

NATIONAL CHRYSANTHEMUM SOCIETY: *Disgusted*. We cannot interfere; it is a purely personal trade

dispute, such as should never occupy the attention of a disinterested public body.

NEWLY-PLANTED VINEY: *Anxious*. By applying a mulch of horse-dung, and then above that a layer of fresh long stable litter, and covering the whole with sheets of iron, you have induced unseasonable root-growth by an excess of warmth. There may be no particular harm done as yet if the Vines have been kept cool, but should the buds have begun to move, there will be nothing that you can do but to shut up the house and begin to force the Vines. If the buds are dormant, remove all of the long litter, and the shutters also, and keep the Vines cool.

NITRATE OF SODA AND FRUITS: *H. B.* We have not read the circular you refer to, but we should not advise you to use nitrate on your Strawberry and Raspberry beds or on fruit trees, but to scratch into the soil phosphate of lime, bone-meal, or simple quick-lime, at the rate of 40 to 60 bushels per acre. The nitrate might not be amiss for any plants required to make rapid leaf-growth; and even in their case, farmyard manure would afford a better dressing, or farmyard drainings, applied twice or thrice during the period of growth, taking care to dilute it with half or three parts water, if it have much strength.

PEAR LEAVES FROM THE CAPE: *Entomosporium*. There is no trace of ordinary fungus growth in the leaves; if it is the "fireblight," that is best to be seen in the young shoots, and is credited to a species of micrococcus. I have no description of appearance of the leaves in fireblight in my United States reports. Of course, fresh tissues must be examined to see the micrococcus. *M. C.*

PLANTS FOR AFFORDING SHELTER NEAR TO AND BENEATH TREES: *J. A. F.* In addition to the Rhododendrons, Mahonia and Snowberry, add to those you purpose to plant, viz., Privet, Gorse (include the double-flowered variety), if not directly under the trees, 1, Phyllirea angustifolia; 2, Common Yew; 3, Buxus, in variety; 4, Jasminum fruticosum; 5, Hypericum calycinum; 6, Ruscus aculeatus; 7, Gaultheria Shallon; 8, Daphne Cneorum; 9, D. Mezereum; 10, D. laureola; 11, Vitex Agnus-Castus; 12, Thuia plicata; 13, T. Nutkaensis. 1, 2, 3, 5, and 10 will grow fairly well beneath trees if the shade is not too dense, and the others where there is partial shade, and some direct sunlight reaches them.

ROSEBEDS AND LIME: *A. L.* The dressing, if the Roses stay in the ground, should not exceed the rate of 40 bushels per acre=1 peck per square rod. If the land is cleared of the Roses, twice this amount may be applied; but it is better to give moderate dressings at intervals of a few years than heavy ones at long intervals, the lime being constantly carried to lower depths by the action of rain and snow, and out of the reach of the plants. This fact affords another reason against burying lime deeply—it is better scratched in with a rake or pricked in with a digging-fork. It will rapidly render the vegetable and animal matters in the soil available as plant food, and will have a good effect on your light land by rendering it less porous. Apply in an unfrozen state of the ground.

TARHEMONTANA CORONARIA: *A. D. F.* Your plant should now be resting, and should so remain till the end of February, in a house whose temperature is 60° at night, and from 5° to 10° higher by day. If it is, as you say, a young plant in a 48-pot, it is good that it should lose its flowers for this season and next—that is, till it is much bigger and stronger. It would appear as if you had afforded the plant much water at the root for some time past, and thus induced the buds to become prominent; and now, owing to the want of sun and light, they have fallen.

SANKEY'S famous GARDEN POTS
* Bulwell Potteries, Nottingham. *

Messrs. Dicksons, Limited, Chester, write:—"The Flower Pots you have so largely supplied us with are light, strong and well made, and in every respect highly satisfactory."

Messrs. Richard Smith & Co., Worcester, write:—"We beg to say that we are highly satisfied with your 'Garden Pots'; they are well made, light, yet strong, and we like them better than any other we have ever used."

Mr. William Bull, 536, King's Road, Chelsea, London, writes:—"For nearly thirty years I have been using your Garden Pots, and still had them the best and cheapest."

THOMAS GREEN & SON, LTD.,

LEEDS and LONDON,

HORTICULTURAL ENGINEERS to HER MAJESTY THE QUEEN, call Special Attention to their Patent Wrought-Iron Municipal or Angular Chambered and Tubular

HOT-WATER BOILERS,

And others with SHELVES, and HOLLOW or ORDINARY CAST-IRON GRATE BARS.

SADDLE BOILERS, With WATERWAY BACKS and WELDED BOILERS, any of which are specially adapted for Heating Greenhouses, Conservatories, Churches, Chapels, Schools, Public Buildings, Entrance Halls, Warehouses, Workshops, &c. They are the neatest, cheapest, most effective, and durable of any extant.

The MUNICIPAL and TUBULAR ones are remarkable for their great heating power, slow combustion, and the length of time the fire will burn without requiring attention.

These Patterns secured the FIRST and HIGHEST PRIZE—a SILVER MEDAL—at the Royal Horticultural Society's Exhibition, South Kensington, London, June 1, 1881.

MUNICIPAL PATTERN BOILER, THE BEST EXTANT.

—FRONT ELEVATION—

—LONGITUDINAL SECTION—

—SECTIONAL PLAN—

The longitudinal section gives a view of the fire-box, water space, flues, &c. The cross section gives a view of the fire-box, water space and V-shaped back. The front elevation shows it set in brickwork, which is necessary for this class of boiler.

TESTIMONIALS.

Re HEATING APPARATUS. Borough Engineer's Office, Municipal Buildings, Leeds, January 9, 1886.
MESRS. THOS. GREEN AND SON, LTD., NORTH STREET, LEEDS.
 GENTLEMEN,—I have great pleasure in bearing testimony to the efficiency and satisfactory working of the Hot-water Heating Apparatus you erected in these public buildings.
 The buildings are four storeys high, and we have a total length of about 28,000 feet of piping in them, varying in size from 1½ in. to 6 in. diameter, with their connections, &c. The several offices and rooms can all be in operation at one time or separately, and the heat regulated by means of the valves to the temperature required, even in the coldest weather.
 Two of your Patent Municipal Pattern Boilers, No. 4, work the whole of this piping easily, although we have three of them fixed. They are very powerful and economical in the consumption of fuel, and I am pleased to be able to report of them and the apparatus so favourably.
 I am, Gentlemen, yours truly, **THOS. HEWSON, Borough Engineer.**
 Morley House, Bagot, St. Saviour's, Jersey, November 10th, 1886.
 GENTLEMEN,—The large Municipal Boiler which you sent me last year is doing its work satisfactorily; it is heating 5000 feet of 4-inch pipe in one of my vineries, and I am quite sure that it has power to work a much greater length, while in cost of fuel it compares favourably with my other Boilers.
 I have now five of your Boilers in use, and I cannot speak too well of their heating powers, or their comparatively small consumption of fuel.
MESRS. THOS. GREEN AND SON, LTD., LEEDS. Yours faithfully, (Signed) **G. W. BASHFORD.**
And HUNDREDS OF OTHER REFERENCES CAN BE GIVEN IF REQUIRED.

Veitch & Sons** seven years, is open to immediate re-engagement in the same capacity. Has had good experience in Covent Garden, and well acquainted with Loddon Shop Trade.—254, Peckham Rye, London, S.E.

FOREMAN, in a large establishment.—Age 30; seventeen years' practical experience in first-class Gardens in all branches, including Orchids, House and Table Decorations. First-class references.—**M. E.**, *Gardeners' Chronicle Office*, 41, Wellington Street, Strand, W.C.

JOURNEYMAN (Inside), under a Foreman; age 23.—**R. PERRY**, Hurstbourne Park, Whitechurch, Hants, can highly recommend a young man as above. Good character from present and previous employers.

JOURNEYMAN.—Age 26; eight years' practical experience in private places and nurseries. Understands Landscape Gardening, Stove and Greenhouse Plants, Propagating, and Flower Gardening.—**F. WEISBACH**, Dersingham, King's Lynn, Norfolk.

JOURNEYMAN, Inside; age 22.—**J. MADDOX** can very highly recommend **James Hill** as a very industrious and reliable Young Man.—**The Gardens**, Glantorraen House, Pontypool.

IMPROVER, or THIRD GARDENER, in a private place.—Age 18; good reference.—**WILLIAM STEEL**, Leach Green, Newsham, Thirk.

IMPROVER, in a Gentleman's Garden, where three or four are kept.—Age 18.—Eighteen months' good character.—**E. SHEPPARD**, Eardeston, near Senbury, Worcestershire.

TO NURSERYMEN and FLORISTS.—Re-engagement desired by a young man (age 23). Nine years' good inside practical experience. Well up in Wreaths, Sprays, &c.—**WALTER OWEN**, Floral Nursery, Maidenhead.

Seed Trade.

SHOPMAN.—Eight years' experience, Wholesale and Retail. Travelling not objected to.—**SEEDSMAN**, 98, Queen's Road, Watford, Herts.

SHOPMAN.—Age 29; thirteen years' practical experience in all branches of the Seed Trade.—**R.**, *Gardeners' Chronicle Office*, 41, Wellington Street, Strand, W.C.

Seed Trade.

SHOPMAN (ASSISTANT).—Age 22; seven years' experience in London and Provinces. First-class references.—Address, stating wages, &c., to **R. P.**, *Gardeners' Chronicle Office*, 41, Wellington Street, Strand, W.C.

SHOPMAN.—Age 25; upwards of ten years' experience. Abstainer. Good references.—**T. B.**, *Gardeners' Chronicle Office*, 41, Wellington Street, Strand, W.C.

TO SEEDSMEN.—A young Man seeks a situation in a Shop. Used to Counter Work, Packing, and Balbs. Good reference.—**W. H.**, 2, Alfred Place, Tottenham Court Road, W.C.

TO FLORISTS, &c.—Situation wanted by a youth. Used to a first-class trader; can make up. Accustomed to Marketing. Near London preferred.—**C. H.**, 3, Roman Road, Preston, Lancashire.

TO FLORISTS.—A Nurseryman's daughter, thoroughly experienced, seeks re-engagement. A good hand at Wreaths, Crosses, Shower Posies, Sprays, &c. Good references.—**M.**, Gateacre Nurseries, Gateacre, Liverpool.

TO FLORISTS.—Engagement wanted by a young lady as **IMPROVER or ASSISTANT**. Well up in Wreaths, Bouquets, Sprays, &c.—**C. B.**, Gravel Lane, Wilmslow, Cheshire.

HOLLOWAY'S PILLS.—Weak Stomachs.—The wisest cannot enumerate one quarter of the distressing symptoms arising from enfeebled digestion, all of which might be readily dispelled by these admirable Pills. They remove all unpleasant tastes from the mouth, flatulency, and constipation. Holloway's Pills rouse the stomach, liver, and every other organ, helping digestion to that healthy tone which fully enables it to convert all we eat and drink to the nourishment of our bodies. Hence the Pills are the surest strengtheners and the safest restoratives in nervousness, wasting, and chronic debility. Holloway's Pills are infallible remedies for impaired appetite, eructations, and a multitude of other disagreeable symptoms, which render miserable the lives of thousands. These Pills are approved by all classes.

ADVERTISERS will greatly assist our efforts to get to Press earlier, by forwarding their favours as EARLY IN THE WEEK as possible.

Deal Direct with the actual Growers.

H. CANNELL AND SONS' SEEDS.—From the fact of their being matured on the best spot in England, our Peas, Mustard, Cress, &c., for present sowing, will be found to produce far better crops than those from colder positions. CATALOGUES free.

Mr. W. COOK, The Gardens, Compton Bassett: "Your English Wonder Pea is a long way ahead of American Wonder; a most valuable variety for early work, either in pots or open border."

It is a wrinkled Marrowfat, flavour equal to Ne Plus Ultra, and only a week later than Sangster's No. 1; a real national gem. 2s. per quart.

H. CANNELL AND SONS, Seed Growers, Swanley, Kent.

To Nurserymen and Public Generally.

HARWOOD BROS. beg to notify that they have PURCHASED the well-known old-established BUSINESS carried on for many years by Mr. GEORGE EDWARDS, Balham Nursery, Balham, S.W., and to whom all future business correspondence should be addressed.

Wednesday Next.

GREAT SALE OF FILMY AND OTHER FERNS.
IN SPLENDID CONDITION.

JUST ARRIVED FROM NEW ZEALAND,
including 120 FINE PLANTS OF TODIA SUPERBA.
A fine lot of the scarce Kidney Fern, TRICHOMANES RENI-
FORME, several HYMENOPHYLLUMS, such as DILA-
TATUM, CRISPATUM, and DEMISSUM. Being all from
New Zealand, these are most suitable for growing in Cool
or Temperate-houses. Also 18 fine specimens of CYATHEA
SMITHII, a scarce and beautiful TREE FERN, with good
straight stems or trunks, from 3 to 6 feet high.

Included in this Sale will be three ALSOPHILA GRINITA, from
Ceylon, one of the rarest and most handsome of Tree Ferns.

MESSRS. PROTHEROE AND MORRIS will
SELL the above by AUCTION, at their Central Sale
Rooms, 67 and 68, Cheapside, London, E.C., on **WEDNESDAY
NEXT,** December 14, at 12 o'clock.
On view morning of Sale, and Catalogues had.

Wednesday Next.

60-5 LILIUM ACURATUM, wonderful Bulbs; unquestionably
the finest received this season.

- 360 " " MACRANTHUM
- 1890 " " SPECIOSUM RUBRUM
- 792 " " " ALBUM
- 576 " " MELPOMENE
- 2400 " " LONGIFLORUM
- 113 " " KRAMERI
- 509 " " CORDIFOLIUM

being the contents of 170 cases, just received from Japan,
in grand condition.
250 STANDARD ROSES, 5000 LILY OF THE VALLEY
Berlin Crowns, 10 cases of NARCISSUS, from the Scilly
Isles; choice-named NARCISSUS, 1000 BEGONIAS, 20
Brisbane LILIES, PANERIE species, AMARYLLIS,
Veitch's choice strain; a quantity of FILMY and other
FERNS, just received from New Zealand; 3 ALSOPHILA
GRINITA, from Ceylon; and DUTCH BULBS.

MESSRS. PROTHEROE AND MORRIS will
SELL the above by AUCTION, at their Central Sale
Rooms, 67 and 68, Cheapside, London, E.C., on **WEDNESDAY
NEXT,** December 14, at 12 o'clock.
On view morning of Sale, and Catalogues had.

Wednesday Next.

A NEW GOLDEN-YELLOW FLOWERED CALLA
from Africa, provisionally named

THE PRIDE OF THE CONGO.

Sender writes:—"On returning from Lake Nyanza, after
experiencing many hardships and dangers from the natives
and beasts, I discovered a magnificent golden-
yellow Lily growing in swamps, with Nymphs and
various other water plants, samples of the different
varieties I am sending. A diligent search was made by
the men under my charge, and the result of finding
about 200 plants in all. You will find the tubers are quite
distinct from the ordinary Lily of the Nile. I have
never seen anything like it. No doubt this will be found
a grand addition to the genus."

MESSRS. PROTHEROE AND MORRIS will
include the above in their SALE on **WEDNESDAY
NEXT,** December 14, at 12 o'clock.
On view morning of Sale, and Catalogues had.

Tuesday Next.—Cheshunt.

GREAT SALE OF FRUIT TREES.
Important to FRUIT GROWERS, MARKET GARDENERS,
and GENTLEMEN requiring FRUIT TREES for planting
to learn next season.

MESSRS. PROTHEROE AND MORRIS are
instructed by Messrs. T. & G. Oylor (who are compelled
to clear the ground), to SELL by AUCTION, on the Premises,
the Elms Fruit Ground, Park Farm, Cheshunt, 1½ mile from
Cheshunt Station, on **TUESDAY NEXT,** December 13, at 12
o'clock precisely, 17,000 clean-grown Bush and Standard FRUIT
TREES, 1 to 6 years old, all in splendid condition for trans-
planting, consisting of Lord Suffield, Wellington, Early Julian,
Keswick Collier, King Pippin, Hawthornden, Warner's King,
and many other Apples; 300 Pond's Seedling Plum, Victoria,
New Orleans, and other varieties; and about 6000 William,
Hazel, Caladash, Beurré de Capuaumont, and other Pears.

May be viewed any day prior to the Sale. Catalogues
may be had on the Premises; of Messrs. T. AND G. OYLOR,
Spitalfields Market; and of the Auctioneers, 67 and 68,
Cheapside, London, E.C.

N.B.—The Auctioneers desire to call attention to this im-
portant Sale. The trees have been grown by Messrs. Oylor
expressly for planting in their own grounds, and consist of
such varieties as they have found from their experience to be
most profitable for market purposes. The trees have been
specially prepared for removal to the new Farm which the
Vendors were about to take, but the negotiations having
fallen through, with regard to planting it with trees, Messrs.
Oylor are compelled to sell them for want of room.

Tuesday Next.

150 Standard ROSES, 40 lots of Stove and Greenhouse Ferns,
from an English Nursery; 27,000 LILY OF THE VALLEY,
Berlin crowns; and about 500 lots of DUTCH BULBS.

MESSRS. PROTHEROE AND MORRIS will
SELL the above by AUCTION, at their Central Sale
Rooms, 67 and 68, Cheapside, London, E.C., on **TUESDAY
NEXT,** December 13, at 12 o'clock.
On view morning of Sale, and Catalogues had.

Dutch Bulbs.—Great Unreserved Sales.

TUESDAY, WEDNESDAY, and THURSDAY NEXT.

MESSRS. PROTHEROE AND MORRIS will
SELL by AUCTION, at their Central Sale Rooms,
67 and 68, Cheapside, London, E.C., as above, at 12 o'clock
each day, large consignments of first-class—
NARCISSUS, HYACINTHUS
CROCUS, TULIPS,
and other Bulbs from Holland. Lotted to suit the Trade and
Private Buyers. About 3500 lots, without reserve.
On view morning of Sale, and Catalogues had.

Thursday Next.—Plants.

Street, Covent Garden, W.C., on **WEDNESDAY and SATUR-
DAY NEXT,** December 14 and 17, at half-past 12 o'clock
precisely, each day.
On view mornings of Sale, and Catalogues had.

WANTED TO RENT, about an ACRE of
GROUND, with a few Greenhouses, well heated; small
Dwelling-house attached preferred; from 8 to 12 miles from
Covent Garden.—G. ROBERTS, 5, Roslands Cottages, Rose-
lands Nursery, Seaside, Eastbourne.

TO BE LET, a GENTLEMAN'S GARDEN,
with ten Glass-houses and a quantity of Lights. Yearly
agreement. Rent, including rates and taxes, £10. Apply to—
G., 11, Bentinck Street, Cavendish Square, London, W.

Warwickshire—Erdington Hall Estate.

TO BE LET, an excellent FARM, situate
within 3 miles of Stephenson Place, Birmingham. There
is a large House and extensive Buildings, and the Land is well
adapted for Market Gardening, being close to the City. It
consists of Arable and Pasture Land, and is about 173 Acres.
For Rent and Particulars, apply to Messrs. J. C. FOWKE
AND SON, Solicitors, 120, Colmore Row, Birmingham.

Hampton, Middlesex.

TO FLORISTS.—FOR SALE, the LEASE,
twelve years unexpired, of ½ Acres Land, Dwelling
House, Stabling, and one Glass House. Stock at valuation.—
A. B. C., Mr. Abbott, 2, Heathfield Villas, Hampton, Middlesex.

**FOR SALE, a NURSERY and FLORIST'S
BUSINESS;** 7 Green and Stove Houses (New), about 5
Acres. Established over 100 years. Half a mile from Station,
and near important City. Well stocked. Price, £2600. Free-
hold. Unusual and exceptionally good opportunity.
ALDER AND CO., 25, Cannon Street, London, E.C.

Cheltenham.

**TO FRUIT GROWERS, MARKET GARDENERS, and
OTHERS.**

THE PROPRIETOR of one of the most
valuable MARKET GARDENS in the county wishes to
DISPOSE of HALF-SHARE of PARTNERSHIP, or, if
desired, the whole may be acquired as a going concern. The
Gardens extend over about 11 acres, and are well stocked with
the choicest Fruit Trees. The extensive Vineries, Peach-
house, and Greenhouses, together with a pretty Villa
Residence, Stabling, Shedding, Piggeries, &c., are all most
conveniently arranged up on the property. Incoming by Valua-
tion. To a moderate capitalist the above offers an exceedingly
rare and lucrative investment.
For further particulars apply to S. F. VARDER, Estate
Agent, Auctioneer and Valuer, Albion Chambers, Clarence
Parade, Cheltenham.

BOILERS and PIPES.—Some thousands of
feet of 4-inch, 3-inch, and 2-inch Iron Piping, 5 Boilers,
5 Vineries, loose Glass, some hundreds of Maidenbar FERNS,
&c., for Sale, cheap. Apply to—
J. LANCASTER, Barnett Cottages, Esther Road, Leytonstone.

THREE HANDSOME CYGNETS.—Would
EXCHANGE for other Ornamental WATER-FOWL.
—Offers to Superintend, Queen's Park, Longton, Staffs.

The **BLLENHEIM** COLLECTION OF ORCHIDS.

UNUSUALLY IMPORTANT SALE. ABSOLUTELY WITHOUT RESERVE.

MESSRS. PROTHEROE & MORRIS

Are honoured with Instructions from the Executors of His Grace the DUKE OF MARLBOROUGH, deceased, to
SELL by AUCTION, WITHOUT RESERVE, on the PREMISES—

BLLENHEIM PALACE GARDENS, near WOODSTOCK, on MONDAY, December 19, and Following Days,
Commencing at 12 o'Clock to the minute each day, the entire Collection of about—

25,000 ESTABLISHED ORCHIDS,

One of the most attractive Sales that has ever taken place, remarkable especially for the unprecedented quantity of Specimen Plants, the large number of fine varieties, and their generally healthy condition. Amongst the many thousands to be sold may be specially mentioned:—

15,000 *Odontoglossum crispum*, the best known type, including about 10,000 growing in beds, lotted to suit large buyers.

- 800 " *Pescatorei*.
- 500 " *citrosimum*.
- 500 " *vexillarium*.
- 30 " *Harryanum*, many of them large pieces.
- 80 " *Insleayi* and *splendens*.
- 50 " *cirrosimum*.
- 50 " *triumphans*.
- 100 " *grande*.
- 60 " *nebulosum*.
- Quantities of *Roezli*, *bictonense*, *blandum*, *Halli*, *Uro Skinneri*, and others. Also —
- " *luteo-purpureum*.
- " *Andersonianum*.
- " *Ruckerianum*.
- " *polyxanthum*.
- " *baphicanthum*.
- " *hebraicum*.
- 200 *Oncidium macranthum*, *hastiferum*, *undulatum*, *loxense*, and *superbiens*.
- 40 *Oncidium ornithorrhynchum*, *cheiroporum*, and others.
- 80 *Laelia anceps alba*, including several magnificent masses, many in spike.
- 100 " *anceps Morado*, *Barkeri*, and others.
- 50 " *purpurata*, mostly large pieces, and the finest of varieties.
- 30 " *barpophylla*, some of the grandest pieces ever seen.
- " *elegans*, *elegans Turneri*, *Marlboroughensis*, several very fine pieces.
- 200 *Cattleya Mendeli*, embracing many matchless specimens remarkable for their size and the magnificence of the varieties.
- 150 " *gigas*, and *gigas imperialis*, several of which are plants of enormous size, and of the best type.
- 90 " *Sanderiana*, some of which are very fine.
- 180 " *Gaskelliana*.
- 180 " *Mossie*, some of which are remarkable pieces.
- 100 " *aurea* and *Dowiana*.
- 30 " *Lawrenceana*, embracing some wonderful specimens.
- 150 " *Triana*, amongst which will be offered many large specimens and special varieties.
- 50 " *Percivaliana*.
- " *Warneri*, *Harrisoniae*, *Schroderae*, *citrina*, *pieturala*, *Bowringiana*, *speciosissima*, *Skinneri alba*, *Skinneri* all in quantity, and many specimens amongst them.
- 3 *Cypripedium Morganae*, 2 of which are very fine pieces.
- 18 " *grande*, mostly large plants.
- 20 " *Sanderiana*, nearly all plants of great size.
- " *selligerum majus*, several grand specimens.
- 25 " *caudatum*, some very large.
- " *Sedeni candidulum*, 6 splendid plants.
- " *cardinale*, fine specimen.
- " *Veitchi*, fine strong plant.

- Cypripedium Schroderi*, 2 fine plants.
- 25 " *Lawrenceanum*, mostly plants of large size.
- " *Elliottianum* (*Rothschildianum*), several exceptionally fine pieces.
- 20 " *hirsutissimum*, all fine pieces.
- 30 " *niveum*.
- 50 " *insigne*, *albo-marginatum*, *punctatum*, *violaceum*, *Maulei*, mostly specimens, fine for cutting.
- 15 " *Stonei*, wonderful specimens.
- " *cananthum superbum*, strong plant.
- " *Spicerianum magnificum*, one large piece and several smaller plants.
- " *Harrisianum*, *Druryi*, and others.
- Uropedium Lindenii*.
- 36 *Vanda tricolor*, *suavis*, *insignis*, *corulea*, including many fine examples.
- 50 " *teres*, forming a bank of fine plants.
- 25 " *Hookeri*, a splendid lot of plants, mostly large pieces.
- 150 *Dendrobium Wardianum*, in various sizes.
- 125 " *Dearei*, a grand lot of plants.
- 50 " *nobile*.
- 50 " *fimbriatum* and *oculatum*.
- 75 " *thyrsilorum*.
- 40 " *Brymerianum*.
- 30 " *heterocarpum*, also a good stock.
- " *filiforme*, *Ainsworthi*, *splendidissimum*, *nobile nobilissimum*, *formosum*, *Cambridgianum*, *suavissimum*, *chrysotoxum*, and others.
- 150 *Celoglyne cristata*, varieties, a grand lot of plants for cutting.
- " *Massangeana*.
- " *pandurata*, three fine pieces.
- Aerides expansum leonis*, large specimens.
- " *Lawrenceana*, a grand plant.
- 50 *Lycaste Skinneri*, including many large masses and fine varieties.
- Sobralia macrantha*, many large plants.
- " *xantholeuca*, three grand pieces.
- 50 *Cymbidium eburneum*, including plants of enormous size, all in grand condition; also fine plants of *Parishi*, *Dayana*, *Mastersii*, *Lowi*, and *giganteum*.
- 30 *Angraecum leonis*, mostly large plants.
- " *sesquipedale*, several fine pieces.
- 300 *Calanthe Veitchii*, *vestita*, *Regnieri*, and others.
- 30 *Anguloa Clowesii*, *Ruck-ri*, *sanguinea*, and *uniflora*.
- 60 *Epidendrum vitellinum majus*, a fine healthy lot of plants.
- " *rhizophorum*, a group of fine plants.
- " *prismatocarpum*, remarkably fine specimen and best variety.
- 250 *Disa grandiflora*, best variety: an exceptionally fine lot, including many large masses.
- 200 *Phalenopsis Schilleriana*, *Sanderiana*, *Dayana*, *grandiflora aurea*, and *amabilis*, a well conditioned lot of plants, many extra large.
- 200 *Masdevalleas*, of sorts.
- Maxillaria grandiflora*, specimen plants.
- Dendrochilum glumaceum* and *filiforme*.
- 100 *Sophranitis grandiflora*, mostly in flower and beautifully grown.
- 30 *Ada aurantiaca*, including specimens of remarkable size and culture; and other Orchids too numerous to specify.

MAY BE VIEWED ANY DAY PRIOR TO THE SALE.

CATALOGUES may be had on the Premises, of the Head Gardener, Mr. T. WHILLANS; and of the Auctioneers, Estate Agents, and Valuers, Central Auction Rooms, 67 and 68, Cheapside, London, E.C.

MESSINGER & CO.'S New CATALOGUE of Greenhouses and Heating Apparatus,

Just issued, will be found the most complete, practical, and reliable guide to all about to build, alter, or heat Greenhouses. Illustrations of every description of Glasshouse, from the largest range of Winter Gardens to the simplest forms of Portable Greenhouses, Plant Protectors, and Garden Frames; also of all the best kind of Boilers, Hot-water Pipes, and all appliances for heating. This Catalogue, possessing hundreds of illustrations of all the latest improvements in greenhouse building and heating, is on a scale never before attempted. It should be in the hands of every one interested in gardening, as it contains many practical hints on the subjects of which it treats, the result of many years' experience. Price, 2s. post-free.

A large number of the illustrations are taken from greenhouses erected by us in various parts of the country; an inspection of this Catalogue shows, therefore, the efficiency of which has been well tested by actual use. The advantages possessed by us enable us to carry out work with the utmost promptness, and in the very best style, at prices which defy competition. Surveys made, and gentlemen waited on in any part of the country. Plans and Estimates free on application.

ORCHIDS—Grand Consignment just to hand. **EPIDENDRUM**, the Beautiful Butterfly Orchid. This free-blooming easily-grown Orchid, excels many of the high priced sorts; large clusters, sure to please, 2s. 6d., 3s. 6d., and 6s. each.
JAMES, Importer, New Malden, Surrey.

VICTOR POTATOS
(SHARPE'S).

This favourite first early Potato, suitable for any Garden, indispensable for Forcing and Early Borders, and likely to take the first rank amongst first earlies for market use. Quality and yield all that could be desired. One well-known market grower has this year had a yield of 15 tons per acre on a large acreage. London and Manchester salesmen speak highly of their quality, and report that Victors will keep their bloom and have a fresh appearance after being in the market some days, when other early Potatos have become discoloured and unsaleable.

The stock we offer is the true yellow-fleshed variety and not the white variety, which is often substituted.

Price per cwt. and ton. State requirements to

LAXTON'S SEED NOVELTIES & SPECIALTIES, 1893.

The Largest Podded First Early Pea.
LAXTON'S GRADUS.—First-class Certificate from the R.H.S., after trial at Chiswick. A first early, 3 feet Pea, ripening with William 1st; pods as large as Duke of Albany, with wrinkled Ne Plus Ultra-like seeds of the richest quality. The most distinct early Pea yet raised. Sealed packets, 3s. 6d.

The Finest Show and Quality Pea.
LAXTON'S ALDERMAN.—Highest award at Chiswick, 1891; 5 feet main crop blue wrinkled Pea, has beaten Duke of Albany and all others in competition. Richest colour and flavour; very heavy cropper. Sealed packets, 3s. 6d.

The Earliest Pea in the World.
LAXTON'S EARLIEST OF ALL (Earliest Selection). Proved the earliest against all others at Chiswick and in America, where it was tested against sixty-seven other earliest sorts; a hardy and prolific (2 feet 6 inches) round blue variety. Half-pot, 1s. 6d., pot 2s. 6d.

LAXTON'S ORACLE PEA has proved itself the largest podded; 3 feet main crop Pea, very scarce, 2s. 6d. per packet.

The Largest Podded Runner Bean.
LAXTON'S TITAN.—A true Scarlet Runner, pods of enormous size and width, very prolific and distinct, 1s. 6d. per packet.

LAXTON'S CHOU DE BEDFORD.—The most delicious and hardiest, as well as one of the most beautiful of the Brassicas. Mr. G. T. MILES, Wycombe Abbey, says "It has proved the *par excellence* of new vegetable, and a great acquisition, 1s. per packet.

NEW WHITE - SKINNED JERUSALEM ARTICHOKE.—In every respect a great advance on the old pink skinned variety, and the first step towards improvement in this nutritious and useful vegetable, 5s. per peck. **The Most Useful Onion.**

LAXTON'S SANDY PRIZE.—Awarded *** at Chiswick, as one of the best of the White Spanish type. There is no finer nor better Onion either for use or exhibition; has been grown 17 inches in circumference by ordinary cultivation, 1s. per packet.

LAXTON'S CONCORD ONION.—The finest of the Intermediates, 1s. 6d. per packet.

AILSA CRAIG.—The heaviest new Exhibition Onion, 1s. 6d. per packet.

THE WROXTON (Improved).—The finest Globe Onion for Show and good keeping, 1s. per packet.

ROUSHAM PARK HERO ONION.—A carefully selected strain, 1s. per packet.

The Earliest Tomato.
LAXTON'S OPEN-AIR.—Awarded *** at Chiswick as the earliest of 81 varieties grown in the open. The hardest and best disease-resister. Fruit handsome, bright vermilion, and does not crack. Plant vigorous, but moderate height, stem woody, very prolific, 1s. per packet.

The Earliest Potato.
THE EARLY LAXTON.—First-class Certificate from the R.H.S., 1891, and awarded ** at Chiswick, 1891, and again in 1892 for earliness, quality, and fertility; very short top, extremely prolific, and the flavour more nearly approaching the old Ashleaf than all other early sorts. The most useful variety yet produced for border, frame, or early market work. Price, 2lb., 3s.; 4lb., 5s.; 7lb., 7s.

The best Late Main-crop Potato.
LAXTON'S THE GENERAL.—The best Potato for general use after Christmas—a handsome white, roundish tuber, with shallow eyes. Flesh white, and of the highest quality; cooks well up to June. Raised from Scotch Champion Magnum Bonum; stem woody and vigorous—a good disease-resister, and very prolific. 7s. 6d. per peck.

LAXTON'S VICTORIOUS, REWARD, and **BEDS HERO,** three high quality and handsome Potatoes, now well known and appreciated for table and exhibition. Each 5s. per peck.

MILES' PERFECTION CARROT.—The finest of the Intermediate type, grown continuously by selection from Mr. Miles' first-prize Carrots, probably the best ever exhibited. 1s. per packet.

BEDS PRIZE TREBLE CURLED PARSLEY.—The best stock of Curled Parsley in the country. 1s. pkt.

NEW SWEET PEAS.
LAXTON'S MADAME CARNOT.—Flower of a nearly self-coloured porcelain-blue, with a singular metallic hue when fully expanded, the nearest approach to a true blue in Sweet Peas, 1s. 6d. per packet.

LAXTON'S ETNA, a brighter, darker, and improved Vesuvius, raised by crossing that pretty variety with Laxton's Invincible Carmine. Very striking and distinct, 1s. 6d. per packet.

LAXTON'S CARMEN SYLVA.—Heliotrope-blue and white with dark carmine boss, very pretty, 1s. 6d. per packet.

LAXTON'S RISING SUN.—A novel and striking colour, a mixture of orange and red, 1s. per packet.

LAXTON'S SPLENDID MIXED, contains all the best new and old varieties and new hybrids in even mixture. The finest strain of mixed Sweet Peas in cultivation, 1s. per packet.

Liberal Trade Terms.

THOS. LAXTON, Seed & Novelty Grower, BEDFORD.

THE

Gardeners' Chronicle.

SATURDAY, DECEMBER 10, 1892.

PENRHYN CASTLE, N. WALES.

THE position of the castellated mansion in this, the finest place I have visited in Wales, is grand; the grounds are undulating, losing their boundaries in their extensiveness, whilst the scenery of mountain, woodland, and sea, is extremely lovely and picturesque. Excellent effect has been added from time to time by the judicious massing of hardy flowering shrubs, whilst those of an ornamental foliage character are harmoniously grouped in juxtaposition. Large breadths of choice hardy flowering bulbs, woodland flowers, and Ferns have been planted. Coniferous trees are evidently at home, where sheltered from the terrific gales which sweep in from the sea, as the choice specimens to be seen fully testify. It has been necessary, however, to plant large plantations of forest trees for shelter. In sheltered nooks around the castle were planted many of our greenhouse plants, such as *Lapageria rosea*, *Arundinaria falcata* (a huge plant), *Agapanthus umbellatus*, *Hydrangeas* of sorts, flourishing, but requiring the help of a little winter protection. A fine pair of *Chamaerops Fortunei* have been out many years. No gaudy flower garden disturbs the repose of the green sward under the windows; but one is provided at a short distance away, where *Begonias* and other summer occupants were very gay during the season.

A portion has been recently added, and this is reached by a charming avenue, bowered with *Fuchsia Riccartonii*—truly a novel and grand approach. This portion has been planted with a choice collection of the newer kinds of Japan and other hardy shrubs. A range of houses near contained a healthy collection of stove and greenhouse plants, Palms, &c. A number of long borders of hardy herbaceous flowers, used principally for cutting purposes, were in the kitchen garden, alongside the huge breadths of well-cultivated vegetables and rows of *Chrysanthemums*.

The Grapes alone were worth a long journey to see. Such immense bunches of Muscats, perfectly finished both in berry and colour. Foster's Seedling, grown in this Muscat-house, were an unusual size, and of exceptionally deep amber colour; so much so, that its identity was a matter of considerable difficulty. The Muscat Vines were inarched on Lady Downes' fifteen years ago—evidently not a bad stock. Black Hamburgs were also magnificent in bunch, colour, and in size of berry. These had also been worked on Lady Downes' twenty-six years ago, the Vines of Lady Downes' having been

planted in 1844 in a mixture of heavy loam and horseflesh. This, however, had to be removed and replaced by a more congenial compost. The Vines have been forced so as to produce ripe Grapes in May over twenty years, and, judging from the stout leaves and footstalks, the sound well-ripened wood, and the clean healthy Vines, good results may be expected for many years to come. Here is a tough nut to crack for some of those sticklers for young Vines for early forcing, who believe that the early exhaustion of Vines, if regularly forced, must inevitably follow. A house containing Madresfield Court, Alicante, and some others, showed similar features of good culture. The system of pruning is a combination of the extension system and the spurring method. Young wood is laid in every year, and old canes occasionally cut out; the wood is kept thin, and the aim is to secure plump ripened buds. The rods are tied to the wires in bundles, and Mr. Speed jocularly tells a story how a recent foreman once asked him "when he should untie those faggot bundles?"

Peaches, too, were excellent: a house of Princess of Wales and Gladstone I have never seen surpassed. Surface-roots are considered a desideratum, and Mr. Speed says half the gardeners are afraid to take the necessary liberties with Peach roots. Here it appears Mr. Speed hesitates not to move trees, even at the commencement of forcing, if it is at all urgent; anyhow, the roots are lifted nearer the surface frequently, and the practice commends itself. The Fig-house is the very best I have seen, and the crops which are annually taken from the trees fully justify the adjective. Thus indoor fruit is thoroughly well done, but not more so than plants, notably Crotons, Calanthes, and decorative kinds generally. Pines, too, were strong and healthy, Queen's, Smooth Cayenne, and C. Rothschild especially so.

Outdoor fruits were less satisfactory, but I noticed many promising cordons on dwarf stocks, and these furnished with plenty of surface roots, may succeed better in this rather humid and less genial climate. A gooseberry-house claims one's attention as interesting; it is simply a huge wire-cage, as a protection from birds.

Jupiter Pluvius was rather spiteful the day I called, for it rained heavily (a frequent occurrence here), otherwise the visit would have been more agreeable. More ample notes might have been made, but the above are a few of the indelible impressions left upon my mind touching the doings of Mr. Walter Speed, one of the most unpretentious of men, but one who so skilfully cultivates the horticultural subjects at this noble domain. *W. Crump, Madresfield Court.*

NEW OR NOTEWORTHY PLANTS.

COSTUS UNIFOLIUS, *N. E. Br. (n. sp.)*.

This is one of the most remarkable species of *Costus* (a genus of Scitamineæ) at present known, and is readily recognised by the short branches of the rhizome bearing but one leaf, the base of which partly encloses the small few-flowered flower-spike. It was introduced from the Gold Coast by F. Sander & Co., who sent a plant of it to Kew, which flowered in the September of this year. The following is a description of the plant:—

Rhizomes extensively creeping, $\frac{1}{4}$ to $\frac{1}{2}$ inch thick, branched, the branches or stems 1 to 3 inches long, clothed with closely convolute, reddish-brown, or pale brown membranous sheaths; the apex rising a little above the soil, and bearing only one leaf at the

extremity. The leaf is from 3 to 5 inches long, and 2 to $3\frac{1}{2}$ inches broad, elliptic in outline, very obtuse, with a short apiculus, thick and leathery in texture, usually spreading horizontally at about $\frac{1}{2}$ to 1 inch above the surface of the earth, dark green above, whitish-green beneath. Flower-spike small, sessile at the apex of the stem, and partly enfolded by the base of the leaf, two-flowered, or perhaps, occasionally three-flowered, and exclusive of the flower $\frac{3}{4}$ inch long. Bracts $\frac{3}{8}$ to $\frac{1}{2}$ inch long, the outer ones oblong lanceolate acute, the inner shorter oblong obtuse, membranous, brown. Calyx $\frac{1}{2}$ to $\frac{5}{8}$ inch long, tubular, unequally three-lobed, the lobes lanceolate acute, membranous, brown. Petals $1\frac{1}{4}$ to $1\frac{3}{4}$ inch long, $3\frac{1}{2}$ to 4 lines broad, spatulate oblong, or oblanceolate oblong, obtuse or sub-acute, apiculate, membranous, pale green. Labellum $1\frac{1}{4}$ to 2 inches long, $\frac{3}{4}$ inch in diameter, the margin crisped and lobulate, white, with the disk and tube deep yellow. Stamen oblong, white, terminated by an ovate acute yellow crest above the short parallel anther-cells. A native of the Gold Coast. *N. E. Brown, Kew.*

CALANTHES AT BICTON.

THE glories of Bicton have so often been told, its fine Conifers described, and the many beauties and attractions of the place become such household words amongst all who take a delight in horticulture, that it is not necessary again to mention them, or attempt to describe them at this time. The Camellias in the large house are just coming into flower, vineries, Peach-houses in various conditions of preparation for the forthcoming season; a greenhouse was full of bright flowering plants, as also are some other structures. Pine-apples are well done. My present purpose is to make a note of the beautiful and effective display Mr. Mayne has in the stove. This house is about 50 feet long by some 20 feet wide, having narrow side-shelves, the centre bed being the chief portion. The house was perhaps erected as a Pine stove, and is, if my memory serves me correctly, a hip-roofed span. The end of the bed facing the entrance is filled with fine pots of *Calanthes*, *C. Veitchii* being the most prominent of these, though *C. vestita rosea* and *C. lutea* are well represented. The *C. Veitchii* are simply superb; good stout spikes, flowers set very closely together, colour unusually vivid, being much darker than is met with in many places. The spikes averaged 4 feet in length, not but what many will have spikes rather longer than this, but there was no drawing or lengthening observed, for the flowers were so close together that the character of the spikes seemed to assume a different form that one usually associates with this charming winter Orchid. Some spikes were carrying twenty-five perfect flowers, fresh and firm, and almost as many yet to open. A large plant of *Adiantum Farleyense* was suspended just over the batch of *Calanthes* at the entrance. Some of the spikes reached up to its dark green fronds, making a rich and pleasing picture. Along the whole of the bed were other *Calanthes* equally good, and intermixed many Crotons of rich colour, the narrow pendulous-leaved kinds being specially bright and vivid. Many nice *Dracenas*, splendidly coloured, were mixed in with them, and beside these foliage plants were finely-bracted *Poinsettias*, Arching sprays of *Euphorbias*, and many spreading panicles of the bright rosy form of *Begonia semperflorens*; a large plant of *Anthurium Scherzerianum* was full of its scarlet spathe, which, standing up well above its foliage, as is usual with this form, permitted every flower to be seen at its full value. Knowing how *Calanthes* suffer when grown in the deleterious atmosphere of some parts of Lancashire, and also how the London fog will in one night ruin a house full of flowers even in some parts of Kent and Surrey, the gay and attractive sight at Bicton was a great pleasure, and I congratulate Mr. Mayne on his success in cultivating these plants, and skill in arranging them. *W. Swan, Bystock, Exmouth.*

RHODODENDRONS.*

(Continued from p. 688.)

THE EUROPEAN SPECIES.

R. ferrugineum and *R. hirsutum* are the only two species of the genus that are wild in Europe. They occur in abundance on the Swiss Alps at high elevations, generally where scarcely anything else grows. They form compact little bushes, varying from 6 inches to 3 feet in height, and when covered with their rosy-red flowers they are particularly effective. In the garden they are perfectly happy, and I know no hardy dwarf evergreen shrub more worthy of a place in a border. At Kew there are several large beds of them, which are presentable at all times of the year. *R. intermedium* is said to be a natural hybrid between these two. In Switzerland they are known as the Rose of the Alps. The flowers, which develop in June, are nearly an inch long, in compact terminal clusters. The principal difference between the two species is in the leaves, *R. hirsutum* having ciliated leaves with glands on both sides. Other wild forms or hybrids of these two species are *R. myrtifolium*, *R. hallense*, and *R. hirsutiforme*.

R. ponticum.—The genus was founded upon this plant by Tournefort, who named it *Chamaerhododendros pontica*. Originally a native of the region of the Black or Pontic Sea and Portugal, it is now naturalised in many parts of Europe. In English woods it sows itself, and comes up freely; it appears to have been introduced into England from Ghent, where it was in cultivation in 1763. A useful plant in itself, it is of special interest as being one of the parents of many beautiful hybrids and crosses. It is commonly used as a stock for the more delicate kinds of *Rhododendron* in this country and in the United States, where, according to Mr. Parsons, it is valuable not only as a stock for the catawbiense seedlings, but also for the Ghent Azaleas in places where they will not thrive on their own roots. There are old woods in England in which this fine useful evergreen is represented by huge bushes—almost trees. In the Queen's Cottage grounds at Kew there are some grand masses of it, which in May or June are a waving sea of purple flowers.

"*Azalea pontica*."—There is another Pontic *Rhododendron* known in gardens as *Azalea pontica*, but to botanists as *Rhododendron flavum*. It is the deciduous twiggly hairy-leaved yellow or orange-flowered shrub which grows a yard or so high, is as hardy as Box, and flowers profusely in spring. Seeds of it were first sent to England by Dr. P. Pallas, who collected them in the Crimea, and gave them to Messrs. Lee & Kennedy of Hammersmith. This is the plant whose flowers are said to poison the honey obtained from them. Mr. H. J. Ross, writing in the *Gardeners' Chronicle* some years ago, said that the poisonous principle is got rid of by heating the honey. I have never heard that honey is affected in this country by this *Azalea*, and I know the flowers are a favourite with bees.

R. dahuricus (Fig. 108, p. 701), was introduced into England from Russia by a Mr. Bush about one hundred years ago, and was distributed by Messrs. Lee & Kennedy. It forms a rather scraggy sparsely-leaved shrub, and is remarkable as an early-flowering species. It was in full bloom out-of-doors this year at Kew on February 28.

R. chrysanthum I have never seen in flower. According to Koch it is not easily kept alive in the garden. It is a dwarf plant with the habit of *R. caucasicum*, and beautiful golden-yellow flowers an inch in diameter. It was figured in Salisbury's *Paradisus*, t. 80 (1805), under the name of *R. officinale*. This plant is worth looking after by hybridists. It is a native of Siberia. Seedlings of it are in cultivation at Kew.

R. kamschaticum, *R. lapponicum*, and several other species from very high elevations are too difficult to keep alive to be worth more than passing mention.

* A paper read before the Kew Gardeners' Society, by W. Watson, Assistant-Curator.

FIG. 106.—RHODODENDRON GAUPLITZIANUM SYN. R. ACCERLANDI: FLOWERS WHITE. FLC. HEED WITH ROSE. (SEE P. 695.)

THE SIKKIM HIMALAYA SPECIES.

The Rhododendrons of the Sikkim Himalaya are the most beautiful plants in the order to which they belong. For the discovery, introduction, and history of most of them, we are indebted to Sir Joseph Hooker, who visited the Himalayas forty years ago. The glorious characters of these plants are set forth in the illustrations and descriptions published in the *Botanical Magazine*, Hooker's *Rhododendrons of the Sikkim Himalaya*, and in various other works [and may be judged of by the illustrations in the present number]. There is a most interesting paper on these Rhododendrons in vol. vii. of the *Journal of the Royal Horticultural Society* (1852) by Sir Joseph Hooker. This paper, which extends over 62 pages, should be read by everyone interested in Rhododendrons. Their distribution, effect in the landscape, habits, the soil they grow in, the nature of the climate and surroundings, these and many other interesting points are there exhaustively dealt with. I will quote only the following passage:—

"It is especially between 10,000 and 14,000 feet that the genus prevails, several species comprising three-quarters of the bulk of the vegetation above the forest region (12,000 feet). There Rhododendron wood supplies the native with fuel and various utensils; the bark and leaves are also brought into service. They are the traveller's constant companion throughout every day's march; on the right hand and on the left of the devious paths the old trees and bushes are seen breast high or branching overhead, whilst the seedlings cover every mossy bank. At 13,000 feet the flanks of the snowy mountains glow with the blood-red blossoms of *R. fulgens*, whilst the beauty of *R. campanulatum*, and the great elegance and delicacy of the yellow bells of *R. campylocarpum* [fig. 107] excite the more admiration from their being found in such regions of fog and rain. Yet with all these advantages of position, and that of an intimate knowledge of the species, I was constantly at a loss to distinguish to which species the seedling plants belonged, especially when they grew intermixed, or to recognise others when distant from their parents."

Darjeeling, which may be considered the headquarters of the Sikkim Rhododendrons, is situated in latitude 27° North, and in the same longitude as Calcutta, from which it is 380 miles distant. Its elevation is 7200 feet, and its mean temperature is 55°. It is never so hot in summer, nor so cold in winter, as it becomes in London. Under cultivation Sikkim Rhododendrons are happiest in those parts of England which are warm, and in close proximity to the sea. The best out-door collection of these plants known to me is at Penllergare, near Swansea in South Wales. Here Sir John Llewelyn cultivates in the open, without any protection, other than that afforded by trees, no fewer than nineteen of the Himalayan species. I am indebted to Mr. Warmington, the gardener at Penllergare, for the following list of them:—

<i>R. argenteum</i>	<i>R. Fortunei</i> (China)
<i>R. arboreum</i> , vars.	<i>R. Falconeri</i>
<i>R. Aucklandii</i> [fig. 106]	<i>R. glaucum</i>
<i>R. barbatum</i>	<i>R. Hodgsoni</i>
<i>R. ciliatum</i>	<i>R. lanatum</i>
<i>R. campanulatum</i>	<i>R. niveum</i>
<i>R. cinnabarinum</i>	<i>R. Roylei</i> [fig. 110, p. 709]
<i>R. Campbellii</i>	<i>R. Thomsonii</i>
<i>R. campylocarpum</i> [fig. 107]	<i>R. Walllichii</i>
<i>R. eximium</i>	

The largest specimens I have seen are in the gardens of Sir Hussey Vivian, Bart., at Singleton, in Swansea. A description of these magnificent trees was contributed to the *Gardeners' Chronicle* in 1882 by Sir John Llewelyn.

The Kew collection of Himalayan Rhododendrons is, of course, rich in number of species. They are grown partly in the open air, others are protected by canvas in winter, but the bulk of the species are in the large winter garden. They are grand plants for large conservatories, and especially for unheated houses, for these Rhododendrons abhor fire heat. Then there are not a few which may be grown in the outside border, or as lawn specimens

in most parts of England, such being *R. campanulatum*, *R. Thomsonii*, *R. cinnabarinum*, and *R. glaucum*. Although Hooker introduced a considerable number of these Sikkim species, there were a few of them in English gardens long anterior to his visit to Sikkim. *R. arboreum* was introduced to the Liverpool Botanic Gardens by Dr. Wallich in 1818, who also sent home about the same time good seeds of *R. formosum*, *R. barbatum*, and *R. campanulatum*. Sir Joseph Hooker recently drew attention to the "singular fact that no additions have been made to Sikkim Rhododendrons since 1849." The following species of this section have yellow flowers:—

<i>R. Roothii</i>	<i>R. lepidotum</i>
<i>R. campylocarpum</i>	<i>R. triflorum</i>
<i>R. citrinum</i>	<i>R. Wightii</i>
<i>R. lanatum</i>	<i>R. cinnabarinum</i> (orange)

THE MALAYAN AND NEW GUINEA SPECIES.

I have already stated that twenty-seven species have been described from these regions, and that only seven of them have, as yet, been introduced into gardens. From these seven, however, a race of garden Rhododendrons, of the highest possible value in horticulture, has been obtained, chiefly by Messrs. James Veitch & Sons. The parents of this race are *R. Teysmannii*, *R. jasminiflorum*, *R. javanicum*, *R. Brookeanum*, *R. multicolor*, and *R. malayanum*. There is a very interesting paper, by Professor Henslow, on the hybrids raised from these in the *Journal of the Royal Horticultural Society*, published two years ago. Some very distinct and handsome-flowered species have been found wild on the mountains of Borneo. Amongst them are *R. Lowii*, 12 to 20 feet high, with clusters of large tubular yellow flowers; *R. ericoides*, 2 to 8 feet high, and Heath-like; *R. verticillatum*, a big crimson-flowered shrub; and *R. buxifolium*, as large as the last, but with Box-like leaves. *W. W.*

(To be continued.)

OAKMERE HALL.

The residence of John Higson, Esq., called Oakmere Hall, is situated in the heart of Delamere Forest. It takes its name from the neighbouring lake called Oakmere. The whole district was at one time a large forest, considerable portions of which are still thickly covered with Scotch Firs and Oaks. It was planted with the latter by the Crown in order to furnish timber for the navy, but from the poverty and light character of the soil the experiment was not successful, the growth of the Oaks being very poor; however, the demand for this wood for naval architecture has ceased. As the growth of trees afford a good criterion as to the natural fertility of soils, it will be seen that we have here to do with a soil of low fertility. With liberal treatment, however, heavy crops of the very best Potatoes are produced on the farms in the district for Manchester and Liverpool markets.

Oakmere Hall gardens appear like an oasis in a wilderness. This is to a large extent due to the high feeding which the light soil requires. Asparagus does remarkably well. Pears and Plums, both on walls and as pyramids, are good; of the former Marie Louise and Williams' Bon Chrétien give large crops on pyramid trees, which are top-dressed with farmyard manure. Apples are, however, this year almost a total failure here. Herbaceous plants are cultivated on a large scale, chiefly for cutting for house decoration; these are supplemented by good annuals. Oriental, Iceland, and Shirley Poppies furnish a succession of brilliant flowers in the order given. Dwarf Scabious and early-flowering Chrysanthemum *Précocité* also give a beautiful contrast of deep purple and golden-yellow, looking well in vases.

The Hall is a curious building, half ecclesiastical, half castellated structure, surrounded by a beautiful lawn, which slopes down to the lake. The lake is partly planted with aquatic plants, and is screened from the road by Rhododendrons, which grow well by the water-side. *F. V. D.*

FORESTRY.

SEASONABLE WORK.

The Walnut (*Juglans regia*, L.) ripens its seed in autumn, when they fall to the ground of their own accord; and as they vegetate the following season, they may be sown at once, or any time during dry favourable weather in winter or early spring. The nuts, which contain the seed, may be sown in drills in a similar way as that given before for the Chestnut, and covered with about 2 inches of fine sandy soil. The drills should be formed on sharp sandy or gravelly soil, as plants raised on soft soil rich in organic matter never mature their wood properly in autumn to stand the winter's frosts.

The Alder (*Alnus glutinosa*, Gaertner.—The seeds of this tree are contained in small cones, and are now ripe and ready for collecting; choose fine dry weather for this purpose, and place the cones in a dry airy loft some 6 or 8 inches deep, and turn them occasionally during winter; when the scales begin to open they should be trodden with the feet to break up the cones and extract the seed. The seed should be sown broadcast on well-worked soil, formed into seed-beds during dry weather in spring. One pound of seed should be allowed for 10 or 12 lineal yards of a 4-foot bed. As the seeds are small and light, they should be sown in an even and uniform manner, and mixed with the surface soil with a light rake, which is all the covering they require. In very dry weather it is an advantage to moisten the seed the day before sowing, and in cases where the soil is of a dry light texture the surface of the bed had better be pressed down with a light roller.

Gather Laburnum pods, which contain the seeds as they become ripe, and stow them away in a dry place till wanted in spring. These should be sown on light sandy soil, either in drills or on beds about 3 inches apart, and covered to the depth of about $\frac{3}{4}$ inch with fine soil.

Trench and prepare a piece of sandy ground on a northern exposure, to be planted with cuttings of Elder, Willows, and the kinds of Poplar and other trees increased by that method; these may be inserted during winter or early spring. *J. B. Webster.*

FOREIGN CORRESPONDENCE.

CHRYSANTHEMUM EXHIBITION AT NEW YORK.

UNDER the auspices of the New York Florists' Club, there was held, at the Madison Square Garden, New York, on November 1 to 6, the annual Chrysanthemum show, which also included exhibits of Orchids, Palms and foliage plants, &c. The amount of cash prizes amounted to 6500 dol., besides numerous Cups for new seedlings, &c. The "Garden" is an ideal place for a flower show, being an immense amphitheatre, with 85,000 square feet of floor space, without a pillar to obstruct, well lighted from above, and surrounded by tiers of seats and boxes, from which the public might take in a bird's-eye view of the whole exhibition at a glance. It was elaborately decorated and festooned with Chinese lanterns, which gave the whole an appropriate and oriental appearance. At the north end an immense arch had been erected, profusely decorated with flowers of Chrysanthemums, *Asparagus plumosus*, *Smilax*, &c. From a horticultural standpoint, the show, in comparison with other years, was a decided improvement, although large Palms and foliage plants, which always give an air of lightness, and soften the great amount of colour so prevalent in exhibitions, were lacking.

The leading class for Chrysanthemums, ten specimen plants, was secured by Ernest Amus, West Hoboken, N.Y., with perfect plants in every respect, and including Ivory, Domination, W. H. Lincoln, Mrs. J. N. Girard, Minnie Wannamaker, Gloriosum, Ada Spaulding, Rohallion, Ed. Molyneux, Mermaid. He also obtained 1st for six and three specimens.

J. Roehrs, Carlton Hill, N.J., was successful in obtaining 1st for ten standards, also for five and for one; and for the group of 300 square feet. Thos. H. Spaulding, Orange, N.J., was 1st for one hundred plants in twenty varieties, single stem. Pitcher & Manda, Short Hills, N.J., were 1st with a grand

but not finish," which does not count very much over here; size is what the average American admires. The prizes in these classes were divided between Messrs. Pitcher & Manda, Ernest Asmus, Dailedouze Bros., Julius Roehrs, F. T. Underhill, J. N. May, Peter Henderson & Co., J. H. Taylor, &c.

bowls, the more artistic appearing the better, and with a hundred or two of these in line, the sight must be seen to be realised. The most prominent varieties in these classes were Minnie Wannamaker, Mrs. E. D. Adams, Ivory, Mrs. Robert Craig (white), W. H. Lincoln, Harry E. Widener, Kioto (yellow),

FIG. 107.—RHODODENDRON CAMPYLOCARPUM. (SEE P. 698.)

lot of plants, consisting of twenty-five novelties introduced in 1892, grown on the single-stem method; W. S. Kimball, Annie Manda, Harry May, Black Beauty, Hicks Arnold, were especially good varieties.

Cut Chrysanthemums were of the highest standard, but, as an English visitor remarked, "they had size

The exhibition-board is being almost entirely dispensed with over here, and the blooms are shown with long stems (not less than 12 inches), with foliage; hence only those varieties with stiff erect stems are cultivated; another very prominent class is that which calls for twelve, twenty-five, or even fifty blooms of one variety, and exhibited in large

Mermaid, Ada Spaulding, Vivian Morel (pink), O. P. Basset, A. G. Rausay, G. W. Childs (crimson), Hicks Arnold, Harry May, and H. F. Spaulding (bronze).

For new seedlings were, best yellow, Mrs. F. L. Ames, shown by Pitcher & Manda; best white, The Queen, shown by W. S. Waby; best bronze, Robert

McInnes, shown by E. G. Hill & Co.; and also for the best of any colour in Mrs. J. W. Crouch, a beautiful crimson incurved; and for the best pink, Mr. John Kease, was 1st, with Pride of Englewood.

Emily Ladenburgh, shown by F. T. Underhill, a fine incurved brownish-crimson, received a 1st prize as being the best variety exhibited previous to 1892 and not yet in commerce.

The Roses were well to the fore, the principal exhibitors in these classes being F. R. Pierson & Co., J. N. May, J. H. Taylor, Ernest Asmus, C. & J. Slaughter, John Reid, and other well-known growers for the New York market.

Ernest Asmus won the Pierson Cup for the most promising Rose, of late introduction, with Kaiserin Augusta Victoria; also the Lanier Cup for best Seedling of European origin, with those of Caroline Testont.

The Taylor Cup for the best new pink Rose was awarded to John Barton for his American Belle, a sport from American Beauty.

For the best Seedling Rose of American origin, J. N. Hay was awarded the Whitney Cup for Mrs. W. C. Whitney, a hybrid, Souvenir d'Ami \times American Beauty.

At either end of the garden was a grand group of Palms and foliage plants, arranged in pyramidal shape. They were in competition for the 250 square feet. Siebrecht & Wadley obtained 1st with a clean lot of plants, prominent among which were *Licuala grandis*, *L. peltata*, *Cycas Rumphii*, *Kentia canterburyana*, *Aracaria excelsa glauca*, *Dracæna Lindenii*, &c.; Geo. M. Stumpp, with almost an equally fine lot, 2nd. Siebrecht & Wadley also showed and received a 1st for 200 square feet ornamental and flowering plants.

Pitcher & Manda were in their element when they competed for the collection of *Cypripediums*, and showed some 120 species; they also obtained 1st for new and rare plants, with *Adiantum cuneatum variegatum* (very pretty), *Maranta Laggeriana* (new species from South America), *Anthurium Brownii \times *Aglonema picta*, *Dracæna Desmetiana*, and *Tillandsia argentea*.*

G. B. Winslade was 1st with six of the best coloured *Crotons* I ever saw.

Among the miscellaneous exhibits, F. R. Pierson showed some new *Cannas* (these plants now taking quite a lead in American summer gardening), Paul Marquart, Alphonse Beuvier, Capitaine P. de Sazzoni, noticeable; and J. W. Elliott, some grand blooms of tuberous *Begonias*, rich and varied in colour and immense size.

Apologies must be made if all the exhibits have not been mentioned, but a full description would take more space than I feel entitled to; enough to say that the exhibition was undoubtedly the finest the country ever saw, and superior to anything seen in Europe. I was pleased to meet during the exhibition Messrs. J. H. Laing, A. Ingram, and A. Dimmock, from England. *New York Correspondent*.

BERLIN LETTER.

Seldom has a plant made itself at home in so short a time as has the *Chrysanthemum* in Berlin. Up to within a few years only a few varieties with white blossoms, 2 to 3 inches in diameter, were known, and these were chiefly used by the poorer folk for funeral wreaths, but now one finds the *Chrysanthemum* in every flower-shop, and on the baskets of the flower-girls in enormous quantities. The colours consist chiefly of pale violet, copper-red, and white, and the flowers loose in form, and from 3 to 4 inches in diameter, and by no means beautiful, but rather the reverse, and the odour evil! But they are the fashion, and that more than balances all their faults and shortcomings. The noble-looking, large-flowered varieties, are only to be found in a few good gardening establishments frequented by the upper ten thousand, as those of Borsig, Spindler and Veit.

What is bizarre is always likely to have success. No wonder, then, that *Cacti* are being brought again to the front; a monthly journal for *Cactus* cultivators, under the editorship of Professor Schumann,

is prospering; moreover, steps have been taken for the formation of a society of succulent cultivators. The above-mentioned journal, under the editorship of the author of the *Monograph of Brazilian Cacti*, is in good hands; and he began his editorial activity with the description and illustration of the new *Cereus Hildmannianus*.

Amongst flowers observed in the flower-shops at the present time are many of *Brugmannsia*. What a pity that the dealers do not make use of the flower in its naturally pendent fashion, but employ it bound with wire, with blooms of *Lilium auratum* and *L. longiflorum* in an erect position in bouquets!

The season was till lately exceptionally mild, although a few weeks ago we had frost of 4° Réaumur, 41° F. Since then the temperature ranged with moist and foggy weather, between 5° and 10° Réaumur, and without any rain or snow. The consequence is, that the trees and shrubs are slow in parting with their foliage, and very many of them, which in other years lose their foliage whilst it is still almost green, in this season are wonderfully beautiful. Particularly is this the case with *Beech*, *Hornbeam*, and *Birch*, also North American species of *Oak*, which have beautiful tints in the autumn.

It is singular in this jubilee-celebrating time that the centenary of the *Camellia* has been passed over in silence. It would have been a good opportunity for a *Camellia* exhibition. In the year 1792 the *Camellia*, which was introduced in 1739, flowered for the first time in Europe. It would be a grateful and interesting task to determine how long the various single-flowered varieties had been in cultivation when the first double-flowers were produced. In view of the great gain these double-flowers were to horticulture, these facts will in every case be readily determinable. That the intervals of time which elapsed between the appearance of the varieties were very various is certain, whilst the double-flowered tuberous *Begonias*, appear, as it were, to rise under our very eyes.

How short is the space of time since *Begonia boliviensis* and allied species were introduced, and how quickly double forms of flowers were obtained! On the other hand, how long it is since *Cyclamen persicum* was first cultivated, and how rarely we see or hear of *C. p. flore-pleno*! *Dr. U. Dammer*.

NURSERY NOTES.

CHRYSANTHEMUMS AT THE FLORAL NURSERY, MAIDENHEAD.

At Castle Hill the *Chrysanthemum* has found a congenial home, and under the supervision of Mr. Owen an immense collection is grown. Besides keeping a large number of named varieties, both new and old, Mr. Owen gives especial attention to the raising of new ones from home-saved seeds, and at the present time his nursery is well worth a visit by those interested in the Autumn Queen. Here have been raised a very great number of English seedlings, and the many certificates they have obtained testify to their first-class quality both for exhibition and decorative purposes. Some two thousand seedlings of this and last year are now on trial, many of which at the time of my visit were not yet in bloom, while others in their half-expanded state give promise of sterling beauty. Besides seedlings of his own raising, Mr. Owen imports from America, France, and other places, giving all a fair trial. During a visit some short time since, I noted the following:—A variety named *Yellow Avalanche*, a seedling from *Avalanche*, is a nice pale yellow, perhaps scarcely large enough for exhibition, but a very useful dwarf grower for decorative purposes. *G. C. Schwabe*, bright carmine-rose, gold centre, long, broad, and recurving florets. *Excelsior*, a variety that has done well this year, and proves to be a grand exhibition flower; colour, bright rose-cerise. *Thomas Hewitt*, rose-lilac, very good; broad incurving florets. *R. Dean* is a very promising seedling, colour crimson-scarlet, back of florets old gold. In

Viscountess Hambleton we have a beautiful incurved Japanese, rather late in flowering this year, but a very good "doer," and of dwarf habit, quite small plants carrying good flowers. Seedling *Seventy-three* is a chestnut of a brighter and deeper colour than *Colonel B. Smith*, which it resembles in form.

Robert Owen, a seedling of last year, which caused some sensation, was as yet scarcely open, but the partially-expanded flowers were fine; colour rich golden-bronzy hue, with very full centre: a magnificent exhibition flower. A large Seedling white of this year is named *Pride of Maidenhead*, a name it is not, apparently, likely to disgrace. A Seedling, named *N. Molyneux*, is a very dark crimson, the deepest colour yet raised; *Mrs. Bruce Findlay*, a pretty pale lilac; *Sea Wave*, very bright magenta-rose, with pointed florets, and many others, including promising seedlings from *Sarah Owen* and *E. Molyneux*.

Among the newer American kinds, *Lord Brooke* is a distinct and pretty variety, bright bronze-yellow, shaded red, of dwarf habit; *Eda Prass*, a delicate pale peach-pink, with incurved florets—very pretty; *J. C. Vaughan*, plum-colour, large and good; *Attorney's Wig*, a curious incurved Japanese, with broad florets, flowers not large; *M. Jules Touloussaint* and *Le Verseau* are two French varieties of promising appearance. All the above are Japanese varieties.

Of incurved kinds, the new *Baron Hirsch*, already certificated, is a decided acquisition, colour a reddish-chestnut with a golden-bronze shade, a fine flower for exhibition; *Lucy Kendall*, a sport from *Violet Tomlin*, opens a deep carmine-rose, shading off to a lighter colour with age, inside of florets a nankeen-yellow; another, a seedling from *Refulgens*, is of similar colour, with broader florets. *Robert Petfield*, mauve, shaded silvery-white, an acquisition among the incurved kinds, a good deep flower. *Mr. Owen* also has many seedlings both of single and *Anemone* varieties, promising to be distinct from any yet in commerce. It may be worth while to remark that the whole of the stock of *Miss Lilian Cope*, the white sport of last year from *Etoile de Lyon*, has here reverted to the original. It would be interesting to know whether this has been the case elsewhere. *II.*

A TRAVELLER'S NOTES.

(Continued from p. 644.)

SINGAPORE, Feb. 16.—The Botanic Gardens at Singapore, presided over by Mr. H. N. Ridley, the head of the Botanic and Forest Departments of the Straits Settlements, are situated a little over three miles out of the town, and are very pretty and well kept. The roads are broad—all covered with red earth—hard and smooth, and the grass, on which are planted the various clumps and single specimens, is remarkably fresh and green (doubtless owing to a continuous rainfall), though a little coarse. All the ground is gently undulating, so that from scarcely any point does one see much of the garden at one time. The garden (66 acres in extent) is entirely surrounded by public roads. The road from the town to the garden, leading past the Government House, is very pretty—now passing through a clipt hedge of a *Bambusa* known here as "nana" (which, however, when unclipt reaches a height of from 10 to 12 feet), and now past a large grove of fine *Mangosteens*; occasionally past rows of Chinese shops, those traders of the East, apparently in the majority everywhere, and often past some fine specimens of *Ravenala madagascariensis*, *Poinciana regia*, *Spathodea campanulata*, the last two now bearing their gorgeously-coloured flowers.

On entering the garden, one is at once struck with the general cleanliness and neatness of the place, the broad, smooth road, 20 feet wide, having on one side a grass-covered slope, dotted with many single specimens, and on the other some fine groups of Palms; whilst very effectively both sides are lined with oblong and small circular beds filled with dwarf flowering plants. These beds are tastefully filled with *Tagetes*, *Coleus*, *Alternanthera*, the pretty dwarf yellow-flowering *Asystasia lutea*, and a taller blue-flowering *Acanthad*—a species of *Barleria*—one sheet of clear blue fair-sized blossoms. I also noticed *Isostoma longifolia*, with its numerous

tubular long white flowers, amongst others. Many of the small circular beds have centre plants, such as a variegated Ananas, or a young Cabbage Palm (*Oreodoxa regia*).

On the slope referred to, on the right of the road, on a thick rich lawn, composed chiefly of a broad-leaved *Paspalum* with a woolly kind of flower, and *Paspalum conjugatum*, with a curious dichotomously-branched spike, are many single specimens, including some Conifers, the most noticeable being two nice specimens of *Arancaria Bidwillii* and *Cunninghamii*, the latter a bushy regular specimen, some 30 feet high; *Dacrydium elatum*, distinguishable by its close small thick foliage, appearing in the distance like a solid dark green pyramid. *Podocarpus* and *Biota* are also represented. Opposite this bank and before reaching the pond, are some fine groups of the Sago Palm, *Metroxylon* leave. The bases of these clumps are impenetrable masses of various-sized off-shoots. In each clump several main stems have gone ahead and tower up for nearly 70 feet. Their large spreading heads are not unlike a Cocoa-nut Palm, but lack the peculiar pale green of that species, and are not so graceful or wavy, but nevertheless the leaves, often 20 feet long (in the young vigorous off-shoots, longer), form a most impressive sight. One of these Sago Palms was in flower, a many-branched head bearing several hundred seeds, each as large as a Greengage.

Near these groups, against the boundary hedge is a fine African Oil Palm, *Elais guineensis*, with a head some 27 feet in diameter on a trunk of much the same height, clothed for the whole of its length from the base upwards, with the lower portions of the dead petioles of former leaves. The leaves have been cut off, but the bases of the leaf-stalks remaining are evidently persistent for a considerable time.

Between these groups of Sago Palms the Ravenalas are very fine, with their half-circular immense heads of flat leaves.

In front of these large groups and close to the row of flower-beds, are some single specimens—including a magnificent bush of the Gum Copal tree, *Hymenæa verrucosa*, a *Brownea coccinea* with its long, often somewhat bare, drooping shoots, studded with numerous heads of its brilliant red flowers; and a *Jonesia Asoca*, a native of Java, with heads of flower produced on the old wood, not unlike an *Ixora* in shape as well as in colour, which varies from pale yellow to brick-red—some of the heads being 8 inches through. These heads of flowers are very numerous, and produced as they are on the old wood on very short stalks, look as though they had been "stuck on" without any choice as to position and without any definite object.

In the pond now reached, grows *Nelumbium*, the pretty, long-stalked peltate leaves being thick on and above the water's surface.

The lake is large, long, and narrowing off at one end; on its right bank near the road are some single specimens, but for the main part it is open, the view over its entire surface, with the exception of a small island in the centre, being almost unbroken. Opposite an *Amherstia* bearing its brilliantly-coloured drooping racemes, is a young *Spathodea campanulata*, its shoots terminating in its equally gorgeously painted large-lobed campanulate blossoms, and near a tall *Dacrydium Horsfieldii*, some 40 feet high (a native of Malaya), is a pretty little *Verschaffeltia splendida*; whilst opposite, on the sloping bank, are various specimens of *Cupressus funebris*.

Further up the pond, are a couple of fine Mangoes, and a *Mimusops Eleni* (the highly-scented, and in India sacred, flowers of which I have so often referred to), in the branches of which are two fine *Asplenium Nidus*, with splendid foliage of the richest pale green, the individual leaves being often 5 feet long.

Beyond these is a small-leaved Fig tree, *Ficus Benjamina*, with scarcely any main stem, but with numerous thick branches (in their turn again much branched), springing in every direction from almost the base of the tree, and forming a huge round even ball when regarded from a distance. On its branches many Orchids—*Phalaenopsis*, *Celogynes*, *Acrides*, &c.—have been attached; the second-named seemed to do best. The leaf of this *Ficus* is small—scarcely 2½ inches long; but it has the unmistakable whitish, smooth bark of the genus. A few feet from its base is an *Areca-nut*—*Areca Catechu*—its slight, tall stem soaring like an arrow straight up through the twisted, irregularly branched Fig, its small head being above the topmost leaves of the Fig; it cannot be less than 100 feet high. Near this Fig are two fruit trees—one *Piarardia dulcis*, a native of Malaya, with strings of fruit,

somewhat like a Grape, sub-acid in flavour, and a favourite with some Europeans. The other is a specimen of the Sentel—*Sandoricum indicum*—not much cared for.

Passing through two groups, one a fine group of Mangosteens—in themselves, apart from their splendid fruit, very handsome trees—with their large opposite leaves—8 to 10 inches long, varying in colour, according to age, from the palest to the darkest green, and so thick and glossy as to resemble on a very large scale a fine *Camellia* at home, and the other a mixed one, composed of *Brownea grandiceps*, *Hibiscus* (producing its large purplish-red flowers), many *Crotons*, and a large *Spathodea campanulata*, the vermilion and orange flowers of which are scattered all over the roadway, one reaches two very interesting plants, one on each side of the road, almost opposite each other. One is a large tree of the deciduous *Pterocarpus indicus*, in the branches of which is an immense mass of *Renanthera arachnites*, its hundreds of dead roots hanging down, and clinging to all the branches within reach. It is a magnificent piece, growing freely.

Opposite to this is a thick bush of *Brownea grandiceps* in flower, some 33 feet in diameter. It is curious how much of its foliage is quite underneath, where no light can possibly get at it, and that many

planted with *Hibiscus*, *Lonicera* flowering freely, *Alternantheras*, *Dracenas*, *Crotons*, and often with a centre-piece, such as *Ravenalia* or *Caryota*. Pairs of Palms at the head of the steps leading to the band-stand, render the general effect very pretty.

Bearing away in the direction of the superintendent's house, and passing a fine pair of *Oreodoxa regia* and a fine *Stevensonia grandifolia* some 30 feet high, with a thick head, each leaf overlapping the other, one reaches a nice young avenue of *Sabal Palmetto*, a native of the Southern United States, N. America. The plants are not much more than 12 feet high, but the broad, grey, palmate leaves are borne on thick stiff stalks coming right away from the base, yielding a particularly pleasing effect.

From this point to the palmetum, situated on the slope immediately beneath the superintendent's house, is a long avenue of the more graceful and delicate-looking *Javanese Palm*, *Rhopalablaste hexandra*; whilst another of *Arenga saccharifera* leads back to the main public road. This last-named avenue is somewhat spoiled by the trees on one side being twice as high and twice as large as those on the other. Both sides were planted at the same time, but for some unexplained cause have failed to thrive equally well. The long dark leaves of these *Arengas* (which I have so often referred to) are very fine; at their base they are enveloped in the stiff, strong, brown spiny hairs. Behind this *Arenga* avenue are long beds of *Bromeliaceæ*, a representative collection of this highly interesting family.

The palmetum is still young—only established some six years, consequently the majority of its specimens are small—amongst their numbers are several species of *Areca*, *Calamus*, *Oreodoxa*, *Cyrtostachys*, *Ptycosperma* (*Kentia*) *McArthurii*, *Verschaffeltia splendida*, and many others, amongst which I must not forget to name a very fine piece of *Corypha Gebanga*, which I do not remember to have seen since I left Calcutta. *James H. Veitch*.

(To be continued.)

FIG. 108.—RHODODENDRON HARDY (EARLY SPRING-FLOWERING SHRUB): FLOWERS, LILAC. (SEE P. 698)

of its gorgeous flowers are in the same position. This is, I think, the finest individual bush of this plant I have yet seen.

Pausing for a moment, and looking back at the rear of the Mangosteen clump before referred to, a view is caught of some splendid *Ravenalas* near some tall *Arecas*; the effect is very fine.

Passing on towards some small beds below the band-stand, one passes a specimen of the famous Champac—*Michelia Champaca*—opposite a large *Calophyllum inophyllum*, which I mentioned as being so fine at Penang. The beds are filled with various plants amongst which I noticed *Mussaenda erythrophylla*, with broad, large, deep crimson bracts, 2½ inches wide, very hairy in a young state. The five-petaled flowers are of a beautiful creamy-yellow, with a centre of short rich crimson hairs. In other beds are *Grammatophyllum speciosum*, *Vanda Hookeri*, and *Arachnanthe Lowii*, all doing well; whilst in a sunk terrace below are some magnificent beds of *Crotons*, 6 to 8 feet high, of the richest crimson and yellow—their great fault is they are rather leggy. A dead flower-stalk on a *Staurosis lissochiloides* near here shows the scars of more than thirty flowers.

The space around the band-stand on a grass terrace, surrounded by a road 30 feet broad, is very prettily and effectively planted. Beyond it, on another raised terrace, are numerous oblong and circular beds

planted with *Hibiscus*, *Lonicera* flowering freely, *Alternantheras*, *Dracenas*, *Crotons*, and often with a centre-piece, such as *Ravenalia* or *Caryota*. Pairs of Palms at the head of the steps leading to the band-stand, render the general effect very pretty.

THE FERN NURSERY, SALE.—The existence of such an extensive and well-appointed establishment, devoted entirely to a collection of Ferns from all parts of the world, as that of Messrs. W. & J. Birkenhead, points to the fact, that in spite of certain Ferns, easy to be raised from spores, occupying a large proportion of the space devoted in gardens to the cultivation of these beautiful plants, there is still sufficient interest shown in uncommon or rare species to keep a nursery well occupied in their cultivation. Indeed, the great difficulty, so far as the rarer species are concerned, has been to get a sufficient stock of them to meet the demand, which is steadily increasing. Hard on 1500 species and varieties of Ferns are cultivated in the score or so of houses and ranges of pits, while large quantities of the hardy kinds are plunged in beds out-of-doors, which are sheltered by rows of trees and shrubs; and everywhere there is evidence that the various species are, each after its kind, hardly grown in the most manageable form for the purchaser, and not nursed up to make merely an effect in the nursery. A cursory glance revealed the great degree of completeness of the collection, and disclosed the presence of small batches of the rare species that are almost unknown in other gardens, and some not yet found in the various botanic gardens of this country. Among these are the singular and beautiful *Danaea crispata*, with its fleshy fronds, of a peculiar tint of green, something like that of *Trichomanes radicans*, the finely-cut pinnae being beautifully crimped, and the stems having curiously swollen joints. Other quite new species are expected to be among the various small importations, and especially among the Filmy Ferns, which have been imported. The rarer of these it is Messrs. Birkenhead's object to place within reach of growers, now it is known that their culture is easy, and that no specially constructed cases are necessary to grow them in. These beautiful species are grown at Sale, not only without difficulty, but in some cases in positions that other plants would not thrive in, such as damp shady corners and moist places beneath plant stages. In such positions was

ROUND MANCHESTER.

found a fine lot of the charming *Hymenophyllum cruentum*, whose fronds at a certain stage turn of a blood-red tint; of the lovely little pigmy *Trichomanes parvulum*, *T. reniforme*, *T. meifolium*, *T. trichoides*, *Hymenophyllum Bridgesii*, and many others which would give an interesting feature in moist nooks in those fine rockeries which Clapham, Pulham, and, indeed, the Messrs. Birkenhead themselves, know so well how to provide, or in similarly humid corners in plant houses. With the *Todea* experiments made at this nursery have proved that they may be grown well in almost any plant-house, or, indeed, under certain circumstances, in a cold frame; but the most important success that may be recorded is the growing of *Todea pellucida* in an ordinary greenhouse, and not protected by a bell-glass or a Fern-case. Of course, when it is thus grown, it requires unremitting attention to see that it does not get dry, or it will quickly perish in the summer time; but the same attention must be afforded a large proportion of other species.

Examination of the *Adiantums*, or Maidenhair Ferns, showed that the genus has been greatly augmented of late years by importation and garden-raised varieties, such as the *A. cuneatum* section, which is now so large as to have become quite embarrassing as regards the relationship these hybrids bear to each other. Among the great collection at Sale we noted the rare *A. Feei*, which has received a not unmerited character of being bad to manage; the elegant *A. dolabriforme*, with its points laden with young plants; the graceful *A. neo-caledonicum*, the deeply-cleft *A. speciosum* and *A. palmatum*, the distinct *A. monochlamys* and the fine *A. Williamsii*, and, of course, that queen of *Adiantums*, *A. Farleyense*. Attempts have been made to secure the curious little Indian *Adiantum Parishii*, but the plants did not survive, and for the present it has failed. The different forms of the hardy *A. capillus-veueris* also embrace many very handsome and distinct kinds, all of which are grown as cool greenhouse or frame plants, for they are not safe unprotected, unless in very favourable situations.

The *Aspleniums*, *Polypodiums*, *Gleichenias*, *Gymnogrammas*, and, indeed, most other genera, are well represented at Sale, but we must be content to name only a few of those which appeared to be either very rare, or were exceptionally well-grown. Among such were *Sadleria cyatheoides*, of Tree-Fern habit, and with elegant pale green foliage; *Davallia fijiensis elegans*, the finest cut, and most beautiful of the species; *Gymnogramma Muelleri*, a singular species from north Australia; *G. Pearcei robusta*, a really strong and manageable form of this delicate species; *Onychium auratum robustum*, which bears the same relation to its species as *G. Pearcei robusta* does to *G. Pearcei*. A similar advantage is secured for the gold Ferns by a giant form of *G. chrysophylla*. In other houses we find *Lygodictyon Fosteri*, *Hypoderris Brownii*, *Pleopeltis fossa*, *Mohria thurifraga achilleaefolia*, many rare *Nothochloas*, *Pellaeas*, and *Cheilanthes*, one of the last-named, *C. odora*, being very fragrant; as also is *Aspidium fragrans*, which fills the house with its delicate odour. Another remarkable section of the Fern collection here is the large number of different species of *Platycerium*, so quaintly contrasting with the frondage of other kinds. The largest were *P. grande*, although the *P. stemmaria* has very massive fertile fronds. The rarest is *P. Wallichii*, and one of the most elegant is *P. Willinckii*.

In one of the warm-houses also there was observed a surprisingly fine collection of *Selaginellas*, which are plants always associated with Ferns, and on turning to the hardy ferneries we found the same profusion as in the more tender species, but at this season many of them are at rest. In this respect the *Scolopendriums* being evergreen are very desirable, and at Sale is a bewildering variety of them, crested, crimped, tasselled, and fringed, in every conceivable way. Two or three new varieties, not yet sent out, are specially beautiful, and notably one, which appears to be a fimbriated and crested form of *S. vulgare crispum*.

The *Lomarias*, *Athyriums*, *Aspidiums*, &c., each

have their quota of standard forms or novelties, and for them, as for the unmentioned, as well as for a valuable number of hints on culture, we must refer our readers to the admirably-compiled and well-illustrated catalogue sent out by the firm. The book in itself is enough to set anyone with the means at his command (and who has not, so far as one or other of the classes are concerned), growing Ferns, and the value of the information conveyed in the different articles as to the proper ways and means of growing all classes of Ferns cannot be over-estimated, as they are the result of years of careful observation and experience by the proprietors.

TREES AND SHRUBS.

EUONYMUS EUROPEUS.

This hardy deciduous shrub is worthy of being more commonly planted in shrubberies and similar places, but will not succeed under the shade of other things. The bright crimson seeds which are exposed when the seed-vessels burst, afford a welcome glow of colour when little else is to be seen in late autumn and early winter. The shrub has possibly been neglected because it is a native, but it should not be despised on that account. It is occasionally seen in a wild state in full beauty, and I know of no other deciduous shrub which is so pretty at the present season. The white-fruited variety is very seldom met with, but is almost as valuable from a decorative point of view, although I am not sure that it fruits so freely as the type; both are very pretty for filling vases and for table decoration in the autumn and early winter. *W. H. Divers, Ketton Hall Gardens.* [*E. e. latifolius* is a fine variety, with larger leaves and bunches of fruits, which exceed those of the type in size. These *Euonymus* require full exposure to the sun to flower them really well. Ed.]

DAPHNE GENKWA.

At first sight this pretty little *Daphne* might easily be mistaken for one of the smaller-growing Lilacs, the colour of its flowers, together with its habit of growth, closely resembling the Persian strain. Although it was first sent out some six-and-twenty years ago from Japan by Mr. Fortune, it was almost lost to cultivation until a few years ago, when it was brought more prominently to the front. It is in every way a valuable and free-flowering shrub, and well worth adding to any list of deciduous blooming shrubs. Its flowers are produced in pairs and clusters, varying from four to six in a cluster, and of a beautiful lilac colour. They are four-lobed, with a tube about half-an-inch long, and carried along slender arching shoots; its leaves are opposite, lanceolate, and slightly downy. It grows to a height of about 3 feet. Unfortunately, it is not sufficiently hardy to withstand the severity of our winters without some kind of protection, but with the shelter of a wall it will be found to do well. It delights in a rich, well drained soil, and should receive copious waterings during its growing period. Not only is it a valuable out-door shrub, but it may with advantage be included in any collection of forcing shrubs. Under careful treatment, it can be had in bloom during the first months of the year with good results. After flowering, the specimens should be encouraged to make growth in a gentle heat, and afterwards placed in full sunshine to ripen their wood. They last a good time in perfection, which is a very important item at this season of the year. H.

THE WEEK'S WORK.

THE KITCHEN GARDEN.

By G. WYTHES, Gardener, Syon House, Brentford.

CELERY.—Means must now be taken to protect the early Celery from frost by means of dry Bracken or long litter placed on a span-like frame over the rows or beds. This kind of covering is also protective in windy weather. The earthing-up of all late Celery should be closely followed up in light soils, but in heavy retentive soils much moulding-up

causes decay, and in such protection it is better than moulding.

BRUSSELS SPROUTS.—All decayed leaves and rubbish should be cleared out from between the rows, and from the plants. The sprouts to be first used are those at the bottom of the stalks, as when these are allowed to remain, the sprouts at the top make slow progress. In no case should the tops be cut off at this season, as these form a protection to the sprouts below. Plants intended for the latest supply of Sprouts should be kept clean, like the others, and have additional soil drawn up to the stems if this seems to be required. The same remark will apply to other Brassicas.

LEEKs.—In order to have these plants nicely blanched, they should be moulded-up somewhat in dry weather, care being taken to keep the soil out of the middle of the plants, and making it, if it be light soil, firm about the stems in so doing. Late successions should be grown as hardy as possible, and no means taken to blanch them at this season.

ONIONS.—Those sown in August, if looking unhealthy, should be afforded a dressing of dry wood-ashes, with a small quantity of guano added, which will check disease, and promote a healthy growth; but before applying the fertiliser, all of the diseased plants should be removed from the beds, and the ground between the rows evenly trodden. The Onions in store should be occasionally examined, and any that are decayed picked out.

POTATOS.—If very early Potatos are required, some well-matured tubers should be placed in loam, leaf-mould, or any light soil, in a temperature of 50°. A hot-bed made up of tree leaves is the best medium, and here they soon make roots; but it is useless to start thus early, unless means can be taken to plant the tubers out in hotbeds when ready, as they soon starve in the boxes, and lose vigour. Frames, if made up at this date, would be in condition for planting early in January. There should be a layer of good loam, 6 to 9 inches, laid on the leaves when these have got regularly heated in all parts of the bed, and this soil should be allowed to become warmed through before the started sets are planted. Veitch's selected Ashleaf and Sharpe's Victor are good early frame varieties. Potatos in store for planting and consumption should be occasionally turned over, and diseased tubers removed. See that the tubers for use do not lay in a large heap, or the warmth and moisture induced by a mass of them laying together will soon set up growth. Seed-tubers should be laid thinly in a cool but frost-proof dry place.

HORSERADISH.—Lift all of the roots, and lay in those which are large enough for table use. Those fit only for planting should be tied in bundles of twenty-five or fifty, and laid in the soil till the planting season arrives. The usable roots may be laid in in rows and covered with soil, and in frosty weather with litter. The ground for the new plantation should be deeply trenched, and if light, well dressed with cow manure, placing the manure in the bottom of the trenches, or at the second course; heavy soil may have burnt refuse incorporated with the soil, and rough stable litter, &c., put into the trenches.

FRUITS UNDER GLASS.

By J. RIDDELL, Gardener, Castle Howard, York.

VINE BORDERS.—These in time, owing to their small size, become exhausted of plant nutriment, and if the object of the gardener is produce of the finest quality, a change of both Vines and soil will sooner or later be unavoidable. The length of time that a Vine soil remains in a fertile condition varies, and it will depend on the amount and kind of drainage provided, the materials of which the border consists, and the treatment which it has received since it was made. The Vines themselves always indicate by their wood, the size of bunches, berries, and leaves, when a change has become desirable, and the present season is the best in which to undertake the heavy work involved in forming new borders. In order that the work may be expeditiously carried out, everything needed should be got in readiness for a start. The first operation should be to clear out the Vines, and give the framework of the vinery a washing with petroleum, especially if mealy bug was present on the Vines; then the soil should be dug out, and wheeled away, and after that is done the drainage of the border should be put in good order. In some cases, it will be necessary to bring the latter a little nearer to the surface, and in others to place it deeper, as most old Vine borders are either

very deep or shallow. If friable yellow turfy loam is to form the staple of the new border, sufficient should be provided for a depth of 2½ feet after it has sunk. As so large a quantity of fresh soil is not at every gardener's command, and soils approaching clay or sand have to be utilised instead, the depth should be proportioned to the kind employed, the heavier the shallower, and vice versa. The various other ingredients acceptable to Vines are also regulated by the kind of soil the gardener has to make use of; sandy soils, having moisture-holding substances mixed with them, and those of a clayey nature some materials which will tend to render them more porous. Provided friable yellow fibry turf is at command, chop it into pieces about 6 inches square, and add in the following proportion, one of lime or old plaster to four of soil; one of fresh horse droppings to six of soil, and one of wood ashes to five of soil, but in the absence of the ashes one hundred-weight of kainit to ten loads of soil, and one hundred-weight of Thomson's Vine Manure to every three loads, and one hundredweight of basic slag to every five loads, of the whole. After thoroughly mixing these ingredients, place a layer of turves, grass downwards, over the drainage, and then fill up the space with the compost, in a rather loose condition, which can be altered, before the young Vines are planted. This completed, wash the woodwork and glass, linewash the walls, mixing a little flowers-of-sulphur in the wash. To make a good job of it, paint the wood and ironwork twice with oil paint, and the hot-water pipes once with lampblack, boiled linseed oil, of the consistency of ordinary paint. This coating for hot-water pipes I have used for ten years for our hot-water pipes, and various other things in the house, and not even the tenderest fronds of Ferns have been affected by it.

THE HARDY FRUIT GARDEN.

By H. MARKHAM, Gardener, Mereworth Castle, Maidstone.

The change experienced in this county from very mild to frosty weather will have put a stop to fruit tree and bush planting; still, there need be no delay in making preparations for a resumption of the work when milder weather comes. Soil and manure may be wheeled to the spots where it will be wanted for planting and top-dressing, leaving it in heaps, or in the case of mulching spreading it at once. Newly-planted trees should always be mulched at the time with half-decayed stable dung, never with fresh stuff.

PRUNING AND NAILING of Plums and Sweet Cherries may be pushed forward when the frost is out of the branches, suitable young shoots being left to fill the places of older ones cut out, the finest fruit coming from young wood. Do not crowd the trees with bearing-shoots. Small lateral shoots may be cut to two or three buds; but leaders, and those intended to grow into main branches, should be left at from 18 inches to 2 feet in length. Trees which make too much strong wood should be root-pruned, rather than pruned too severely. Crab stocks for working should be bought and planted when convenient, selecting the free-growing ones. Trim the roots carefully before planting. Where outside work is generally at a standstill, sizers and labels may be made, stakes pointed, and nets mended. The fruit in the fruit-room will require weekly examination, all decaying fruits being removed, and the room well ventilated in fine mild weather. In a frost-proof place, which is moderately damp, Apples are kept in a plumper condition than in a dry one, but Pears are the better if stored in a room somewhat warmer, which brings out the flavour.

THE FLOWER GARDEN.

By H. W. WARD, Gardener, Longford Castle, Salisbury.

MAKING GRAVEL WALKS.—It is a matter of some importance that new walks should be made with a due regard to the purpose for which they will be used; and if for vehicular traffic as well as for pedestrians, as is generally the case in large gardens, a greater depth of soil than would be necessary in the case of walks for pedestrians only should be excavated, so as to find space for a good quantity of hard materials as a foundation, and for drainage. The first point to determine when making a walk, after the line of direction has been decided upon, is the width that it shall be made. Main walks should be from 10 to 18 feet in width, according to their length and the extent of the grounds, the others being from 5 to 7 feet wide. This done, due regard should be paid to the level of the ground on either side of the walk, as well as the direction in which it is proposed to take the surface-water. A depth

of from 9 to 18 inches, in a general way, is ample for walks of the above dimensions; but in cases where the top soil is shallow, and rests on chalk, gravel, or stone, all that is necessary is to remove the top soil, with which the ground on either side the walk may be rendered level, and depressions filled up. Whatever kind of edging is employed, whether turf, box, flints, Heather, &c., it should be laid before the bottoming of the walk is proceeded with. The bottoms of walks should be deeper at the sides, that is, the walk should be slightly convex, forming at the sides channels to convey water away. If the substratum be chalk, the surface should be well pounded, allowing sufficient fall (longitudinally) to the points towards which it is decided to drain the walks, providing means at each outlet to convey thither any water that might lodge on the opposite side of the walk, that is, when it is not convenient to have outlets connected with drains or "catchpits" on both sides of the walk. In the case of walks on soils resting on a bed of chalk, gravel, or stone, as mentioned above, a smaller quantity of hard material becomes necessary. A broad walk, having an excavated depth of 18 inches, should have at least 1 foot of rough hard material put into the bottom, over this a layer 3 inches thick of coarse gravel, followed by a like depth of fine red gravel, if obtainable. This should be raked level and smooth, and rolled as soon as dry enough—first with a light, and afterwards with a heavy roller, repeating the operation on four or five days in succession (weather permitting), or until a level firm surface is obtained. Walks of from 9 to 12 inches deep should be afforded a layer of proportionate thickness of the several materials recommended for the work described above. Bold, graceful curves should be observed in making winding walks. Where Box is used as an edging, the work requires to be performed with precision and neatness.

HERBACEOUS BORDERS.—Having cleared away dead flower-stems, &c., put a layer of short dung on the land, and "point" it into the ground, taking care not to go so deep as to injure roots or bulbs. Failing short dung, or if the land is not poor, leaf-mould may be applied instead.

PLANTS UNDER GLASS.

By R. MILNER, Gardener, Penrice Castle, Swansea.

STOVE PLANTS.—Overgrown Crotons may be headed back at this season, first taking precautions to withhold water from the plants a few days previously, and to keep them on the dry side till they break away into growth. On bright days syringe the cut-back plants with tepid water. After cutting-back is a good time to examine carefully for mealy-mug, scale, &c. Dracaenas which have lost their leaves, and developed long stems, may be cut back at this season, and the stems, if increase is desired, may be cut into pieces of 1½ to 2 inches long, and placed singly, in small pots, or several together in shallow pans, about 1 inch apart, in light sandy compost, covering them with about half an inch of the finer portions, and afterwards placing them in the propagating-frame. These will soon strike, producing a number of useful plants, which may be grown on in hotbeds or the stove as soon as March arrives. Also increase the stock of Pandaus Veitchii by suckers taken off old plants; pot these if they have no roots, and keep them rather dry till well rooted and established. By propagating these various plants at an early date, they will the sooner become of use in decorating-work. Head back Eucalyptus and Aralias, taking care not to cut below the graft. Those which strike from cuttings may be increased in that way. The plants used for front lines of stages, the margins of beds, &c., should be propagated forthwith. The following are amongst those most suitable for this purpose:—*Isolepis gracilis*, *Tradescantias*, *Selaginellas*, *Gymnostachyum*, and *Panicum variegatum*.

CAMELLIAS—During the winter months, Camellias require a good deal of attention, as, for instance, if during severe frost, too much fire-heat is allowed, the buds fall largely, therefore, no more heat should be used than will maintain a night temperature of 45° to 50°, with a rise of 5° by day. Do not let any plant stand near the hot-water pipes or other heating apparatus, as a dry state of the roots will generally bring about bud-dropping. When Camellias are required to be in bloom early in the season, they should be encouraged to make and complete their growth early in the summer. By the exercise of forethought, and a good stock of plants of flowering age, a succession of bloom can be obtained from November till the end of May. Camellias which are

planted in beds or borders should be examined occasionally as to the state of the borders, &c., which should be moist rather than dry. Weak manure-water and soot may occasionally be supplied to such plants as are carrying good crops of flower-buds. Sponging of the foliage of Camellias, freeing them from dust and black fungus, is very essential for the health and good appearance of the plants. It is usually a winter job, but when time can be spared, it should be more frequently performed. A lower temperature should prevail in the stove during the present month, and until the days perceptibly lengthen, 60° by night will be quite sufficient, with a rise of from 5° to 10° by day; and during frosty weather, rather than keep the hot-water-pipes very hot, the thermometer may be allowed to fall 5°; and if the roof is covered—at least, so far as regards the lower 6 feet at the bottom of the slope—with Frigi Domo canvas, straw-mats, &c., no harm will accrue, and fuel will have been economised, and the plants will be all the better for the plan adopted.

THE ORCHID HOUSES.

By H. A. BURBERRY, Orchid Grower, Highbury, Birmingham.

FLOWERS FOR DECEMBER.—*Laelia autumnalis* is one of the most useful species for flowering in this month, as it makes a lovely group for the flower-house, arranged with Maidenhair Fern, and the white variety of *L. autumnalis alba*, together with *L. Gouldiana*, *L. purpurata*, and *L. albida*. These species are better for a cool, dry temperature, and being watered sparingly during the winter months. The deciduous *Calanthes* are others are now at their best, making a good floral show. *Calanthe Veitchii*, *C. vestita rubro-oculata*, *C. v. luteo-oculata*, and *C. Turneri* are familiar plants in most gardens, and from the cross-fertilisation of these varieties have sprung numerous beautiful hybrids of varied shades of pink and delicate intermediate tints, and to white. Many of these are in commerce, viz., *C. Veitchii alba*, *C. Sandhurstiana*, *C. Sedeni*, *C. bella*, &c. A rich collection of these useful winter-flowering Orchids if seen in bloom would be sure to stimulate an Orchid hybridist to make renewed attempts in the way of securing still finer varieties. *Calanthes* may in course of time become very popular as garden plants, rivalling in point of numbers the *Cypripedium*. *Sophrontis grandiflora*, too, is a conspicuous flower, and deserves to be largely cultivated. Small panfuls of *Sophrontis* suspended in the cool-house take up but little space, and afford a large supply of flowers, which are useful in many ways, and last a long time in perfection. A variety generally known as *S. grandiflora purpurea*, but sometimes as *S. g. rosea*, is as beautiful as the former, but the flowers are shorter lived. It differs from the typical form, chiefly by the pseudobulbs being inclined to be flat, and the foliage of greater substance, and has a more depressed style of growth. I find this species is not so hardy as the former, and requires removal to the intermediate-house for the winter. Of the genus *Angraecum*, which is always beautiful and interesting, a few are generally to be seen in bloom during this season of the year, including *A. sesquipedale* and *A. eburneum*; also *Saccolabium giganteum*, *S. g. illustre*, *Odontoglossum cordatum*, *O. maculatum*, and *Oncidium unguiculatum*. Towards the end of the present month, a few flowers of *Laelia anceps* will be out, but I prefer to keep the bulk of these for the following month.

POTTING.—The repotting of *Pleiones* may now be proceeded with, or at least as soon as the flowering of the plants is past, as the longer these are delayed, the greater the mischief, root-action commencing at once. Chopped peat and sphagnum moss, with a liberal addition of loam, sand, and powdered cow-dung, mixed together, is a capital compost for these, and it should be put on the surface of the crocks to the depth of about 2 inches in depth, and firmly pressed down, leaving the surface slightly raised above the rim of the pot or pan; into this the pseudobulbs, after having been freed from inert matter, should be dibbled at equal distances apart. Enough of the old roots should be left attached to the base of the pseudobulb to assist in keeping them firmly set in position until the new roots take hold of the compost. A place near the glass in the cool house should be found for them, and at present but little moisture should be afforded—just sufficient to keep the compost slightly moist. I have found *P. Lagenaria* doing well when fully exposed to the sun, but it is advisable to grow the other species in houses which are shaded during subsidence.

EDITORIAL NOTICES.

LETTERS FOR PUBLICATION.—All communications intended for publication, as well as specimens and plants for naming, should be addressed to the Editor, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

NEWSPAPERS.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

Advertisements should not be sent to the Editor, but to the Publisher.

APPOINTMENTS FOR THE ENSUING WEEK.

SHOW.

TUESDAY, DEC. 13. } Royal Horticultural Society, at the Drill Hall, James Street, Westminster.

MEETING.

THURSDAY, DEC. 15. } Brighton and Hove Chrysanthemum Society.

SALES.

TUESDAY, DEC. 13. } Plants and Bulbs, at Protheroe & Morris' Rooms.
Sale of Orchids, Exhibition Plants, &c., at the Bageecha Park Gardens, Weston, Bath, by Protheroe & Morris.
17,000 Fruit Trees, at the Elms Fruit Ground, Park Farm, Chesbunt, by Protheroe & Morris.

WEDNESDAY, DEC. 14. } Lilium auratum, at Protheroe & Morris' Rooms.
Dutch Bulbs, Roses, Shrubs, Plants, Roots, &c., at Stevens' Rooms.

THURSDAY, DEC. 15. } Bulbs and Plants, at Protheroe & Morris' Rooms.

FRIDAY, DEC. 16. } Orchids, at Protheroe & Morris' Rooms.

SATURDAY, DEC. 17. } Roses, Shrubs, Plants, Lilium auratum, &c., at Stevens' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—40°·6.

Gardening as a Profession.

THE appointment of a gentleman from the architect's office of the London Council to be chief officer of the parks and open spaces under the control of that body, and with a horticulturist as his subordinate, suggests some rather unpleasant reflections. In commenting on the subject, we desire to eliminate the personal element altogether: indeed, we could not do otherwise, as we are wholly unacquainted with the gentleman appointed, and we are utterly ignorant of his qualifications for the post. He may be a highly competent gardener and estate manager; and if so, he will have ample opportunity of exercising his ability. But what we feel deeply is, that the Council should have thought it desirable to go to the architect's office to find a suitable official, when there are scores of competent men among the gardeners and stewards of the country. Among the present superintendents are men of capacity, as evidenced by the establishments under their charge, and who might fairly look forward to promotion in their department rather than to have an architect foisted on them. We have been amused rather than otherwise at the pretentious arrogance of some architects lately in dealing with questions which they do not understand, and we have wondered what the architects would say if the landscape gardeners invaded their province, and arranged the position and curves of the staircase, or the precise height of the portico. But this has been chiefly a paper war, and the dogmatism of the combatants on either side has only created amusement. But the case assumes a more serious aspect when a gentleman from the architect's office is appointed to take charge

of 3000 acres of parks and open spaces. Was the Royal Horticultural Society consulted in the matter? Was anybody? Have the gardeners been tried and failed? Well,—if we are to judge from the wretched cockney structures set up in Battersea Park which are fitted for the cornice or façade of a temple, or other important building which are here placed on the ground against a bank in the "subtropical garden" (?) and from the finials or pinnacles from some building which are also dumped down on the bank of one of the lakes, the deplorable defacement of Ravenscourt Park, or the meaningless wobble-waggles on the Victoria Embankment, the senseless arrangement of the flower beds in that garden, the spoliation of the lawns, the barbaric surgery practised on the shrubs without reference to their nature or mode of growth,—we should be disposed to think the gardeners had failed; but as a matter of fact, gardeners competent to direct can have had little or nothing to do with the matter. Things have been evidently pretty much left to garden labourers (we are speaking of the Embankment Gardens), and who, we are bound to confess, are not much more likely to act satisfactorily as landscape gardeners than the architects themselves. All the more necessary is it, therefore, that they should act under the direction of some competent official.

This preference of an architect to a landscape gardener, however lamentable from a public point of view is, of course, a triumph for the architects, and a humiliation to the landscape gardeners. To what are we to attribute this? Is it not in large measure to a want of proper organisation among the gardeners? The architects are an organised professional body, like the lawyers and the doctors, and both they and the public in general profit by the standard of capacity and character which is thus guaranteed. But for the gardener there is nothing of the kind. Isolated, and unwilling to act in concert, they have been, and so they are likely to remain. Much is demanded of them, incessant foresight is a necessary of their craft, great responsibilities are thrust upon them, and yet in public estimation they stand no higher than domestic servants with much inferior qualifications, and they are passed over in favour of members of other professions when what would be a legitimate object of ambition on the part of the gardener presents itself. The fault for this state of things partly rests with the gardeners themselves. They are lacking in cohesion, they are indifferent to and do not adequately support the organisations which might and would help them. How many of the gardeners of the kingdom, for instance, are members of the Royal Horticultural Society? Very few. But is it not certain that if they were represented in sufficient numbers on that body, they might impose their will upon it, and compel it to take the lead, not only in certain departments, as it already does, but also in those questions which concern the education, the social position and the welfare of the gardener. For instance, would not the Institute of British Architects at once take action, indirect, if not direct, if such an insult to their profession were made as that which has been (all inadvertently, no doubt), inflicted on the gardeners. Suppose a chemist and druggist could be appointed as physician to a hospital, would not the College of Physicians demand to know the reason? Or, suppose that a solicitor's clerk could be appointed a County Court judge, fancy the commotion in the Inns of Court and on the Bench. Our suppositions cases

are farcical and impossible—ought not the gardening fraternity to be so organised that any like case in it should also be considered farcical? The matter is not a merely professional one—it concerns the ratepayers and the public at large. The ratepayers and the public of the metropolis are, of course, immensely concerned in the proper administration of the parks, whilst the whole nation is concerned in the agricultural depression. Is it not obvious in this connection that the gardeners succeed where the farmers fail? Look at the immense horticultural establishments, the market gardens, the fruit grounds, the houses for the growth of Tomatoes, Grapes, Cucumbers, &c., which are to be found now in the environs of every town! Do they not show that the gardener can make something out of the land even now, when the agriculturist is at his wit's end? We do not care to push the matter too far. We allude to it to show that the horticulturist is a much more important man in the country than he is usually supposed to be, and, moreover, that the methods which lead to success in horticulture would be equally likely to do so in agriculture. It is time, therefore, that the horticulturist should have proper recognition, and that such an anomaly as the appointment of a gentleman from the architect's office should be rendered either impossible, or capable of satisfactory explanation.

In the meantime, the general diffusion of practical knowledge by the agency of the County Councils, and the establishment of a higher system of education in the principles of their art, which the Royal Horticultural Society and other bodies are now striving to bring about, are hopeful signs that the present powerlessness of the gardeners will not as heretofore be transmitted to succeeding generations.

OUR ALMANAC.—Secretaries of societies and others are earnestly requested to forward immediately, the dates of show-fixtures, and meetings of horticultural societies of any kind for 1893, for insertion in the Almanack to be published in our issue for January 1.

TACSONIA (HYBRIDA) SMYTHIANA.—We avail ourselves of the opportunity of figuring a very handsome Tacsonia, raised by Mr. SMYTHE, in the gardens of Basing Park, near Alton, apparently between *T. mollissima* and some other species. The leaves are dark green and glabrous above, softly hairy beneath, deeply divided into three lanceolate serrated lobes. The flowers measure about 5 inches in length, and are provided with a tubular cylindrical calyx, slit on one side, and downy within. The flower-tube is glabrescent, or slightly downy, the calyx-lobes oblong aristate, the petals rather shorter, oblong-obtuse, of a peculiar and most distinct colour, which some have called rosy-salmon, and others orange-scarlet—in any case, it is very brilliant. The corona consists of a double row of small, blunt, purple tubercles. The elliptic-oblong ovary is downy. These characteristics are very like those of *T. mollissima*, but the colour is entirely different. Mr. SMYTHE, who has sent us flowers on more than one occasion, tells us the plant has been flowering freely out-of-doors on a south wall throughout the summer. It was growing in a 10-inch pot, which was removed at the end of October into the greenhouse, where it continues to flower; indeed it is, in Mr. SMYTHE'S opinion, one of the very best greenhouse and conservatory climbers, flowering for nine or ten mouths of the year. The plant has been previously figured in the *Gardening World*, but we have, unfortunately, mislaid the reference, and are quoting at second-hand. It is therein stated that the plant was raised between *T. manicata* and *T. (hybrida) exoniensis*; but this seems very unlikely. The peculiar slit calyx points to *mollissima* or *tomentosa* as one of the parents.

FIG. 109.—TACSONIA HYBRIDA SMYTHIANA: FLOWERS, ORANGE-SCARLET. (SEE P. 704.)

NATIONAL ROSE SOCIETY.—The annual meeting will take place, by the permission of the Horticultural Club, at their rooms on Tuesday, December 13, at 3 o'clock. The Chair will be taken by the President of the Society, the Very Rev. the Dean of ROCHESTER.

LINNEAN SOCIETY.—At the meeting which was held on Thursday, December 1, Professor STEWART, President, in the chair, Messrs. A. P. GREEN, A. B. MORRIS, A. F. KENT, H. W. MONCKTON, and F. G. PARSONS, were elected Fellows. A letter was read from the Rev. LEONARD BLOMEFIELD, M.A., F.L.S., expressing his high appreciation of the compliment paid him by the presentation of the illuminated address, which had been signed by the Fellows present at the last meeting of the Society, and forwarded to him. Messrs. H. & J. GROVES exhibited specimens of several Irish Characeæ collected during the past summer. *Nitella tenuissima*, from Westmeath and Galway, had not been previously recorded from Ireland; and a large form of *N. gracilis*, from two lakes in Wicklow, had been only once previously met with. Referring to the former, Mr. H. GROVES remarked that, although it might be expected to occur in all the peat districts, it had only been found in two widely-separated localities in England, namely, in the Cambridgeshire Fens, and in Anglesea. Mr. A. LISTER made some remarks on the Nuclei of Mycetozoa, exhibiting some preparations under the microscope. Mr. D. MORRIS exhibited some tubers of the *Calathea Allouia*, eaten as Potatoes in Trinidad, where it is known as Tapa Nam Cour. A communication was read from Mr. J. H. HART, of the Botanic Gardens, Trinidad, on *Cladonia cephalotes* and the fungi it cultivates. The meeting adjourned to December 15.

—At the usual meeting on Thursday, Dec. 15, at 8 P.M., the following papers will be read:—1. "Notes on the Genera of Taxaceæ and Conifereæ," by Dr. MAXWELL T. MASTERS, F.R.S., F.L.S. 2. "Note on the Affinities of the Genus *Madrepora*," by GEORGE BROOK, F.L.S.

HORTICULTURAL CLUB.—The usual monthly dinner and *conversazione* will take place at the rooms of the Club, Hotel Windsor, Victoria Street, Westminster, S.W., on Tuesday next, December 13, at 6 P.M. The chair will be taken by Mr. HARRY J. VERRILL, Vice-Chairman of the Club. The subject for discussion will be on Growing the Chrysanthemum for Exhibition, and will be opened by the Worshipful the Mayor of TAUNTON, the winner of the Champion Challenge Cup of the National Chrysanthemum Society last month.

IMPERIAL BOTANIC GARDEN, ST. PETERSBURG.—The Director who replaces the late Dr. REBEL is Dr. A. F. BATALIN; Messrs. KORSHINSKY and MONTEVERDE are the "Oberbotaniker"; Mr. WINKLER Senior Conservator, and Messrs. KUSNETZOW and R. REBEL Junior Conservators. The Librarian is Mr. ROSTOROZEW.

UNIVERSITY OF PRAGUE.—Baron Dr. RICHARD VON WEITSTEIN, formerly of Vienna, is appointed Professor of Botany at the University of Prague.

CHICAGO EXHIBITION.—In reference to the announcement made in our columns last week (p. 676), we are informed that Mr. McINDOE is not the only English gardener who has been honoured with a special invitation from the executive of the above to exhibit at the Great Horticultural Show next autumn a collection of fruit similar to the one shown by him at the International Exhibition, Earl's Court, last August, inasmuch as Messrs. GOODACRE, H. W. WARD, and other successful exhibitors at the latter show, were also applied to in identical language, the letters of invitation from Mr. J. M. SAMUELS, Chief Department of Horticulture, Chicago, being dated September 17, and received ten days later.

BIRMINGHAM GARDENERS' ASSOCIATION.—At the last meeting of the Association, Mr. W. CRUMP,

The Gardens, Madresfield Court, Worcester, read a good practical paper "On the Culture of the Apple," giving advice as to planting and pruning, and condemning root-pruning, excepting so far as bruised roots are concerned. Mr. CRUMP also exhibited specimen fruits of 100 varieties of Apples from their Experimental Gardens at Madresfield, including two or three very promising seedlings, and some local and but little-known kinds.

PRESENTATION TO MRS. GLADSTONE.—During the Premier's visit to Liverpool last week, to receive the freedom of the city, Mrs. GLADSTONE was pleased to accept a very handsome bouquet of choice Orchids presented by Mr. JOHN COWAN, on behalf of the Liverpool Horticultural Co.

CION, OR SCION?—"The difference between 'cion' and 'scion' is not generally known. Cion, refers to the cutting of a tree, and scion to the animal kingdom, no matter what *Webster's Dictionary* may say about it. This difference was recognised by all of the early English scholars, BACON included." ANDREW S. FULLER, in *Gardening*. [It is true that BACON's *Sylva Sylvarum* has "cions" (ed. 10, 1676). EVELYN's *Sylva* (1678), has grafts (French, greffes), Inquisitions (Latiu), and cions; PAURINSON, who wrote more genuine English than EVELYN (1629) has "grafts," and does not use the word cion or scion at all. MILLER (*Dictionary*) writes cion. LITTRÉ's *Dictionary* gives "scion" in the sense of shoot or graft, but not "cion," which latter, accordingly, is the truer English. Ed.]

HORTICULTURAL TEACHING IN BELGIUM.—According to the *Illustration Horticole*, Belgium has two Government establishments—one at Ghent, with an average of forty-four pupils, and one at Vilvorde, with an average of thirty-eight. In addition, the Government subsidises six other establishments, in which tuition and experiments are carried on—at Liège, Tournai, Mons, Carlsbourg, Virton, and Tirlemont.

XENIA ORCHIDACEA.—Dr. KRÄNZLIN of Berlin is continuing this useful publication, formerly issued by Professor REICHENBACH. The species are well and accurately figured, so far as we can judge. Some of them are purely of botanical interest. As we are sometimes asked the meaning of the title, we may remind our readers that the Greek word *xenia* signifies a gift or a present.

MOISTURE AND VEGETATION.—M. E. GAIN has been conducting some comparative experiments, with a view of ascertaining the effect of a moist soil and of a moist atmosphere on the development of plants. M. GAIN finds the action of moist soil very variable according to different circumstances, especially the physical conditions of the soil. The period of flowering is retarded either by dryness of soil, or by moist atmosphere, and it is hastened either by dry air or by moist soil. Under ordinary circumstances, in practice the conditions are combined or mixed. The two factors which retard flowering are a dry soil and a moist atmosphere. These conditions only occur in a foggy or clouded country where the soil is very porous. A combination (1) of moist air and moist soil is very common in wet seasons on a retentive soil; an analogous combination (2) of dry soil and dry air is common in some hot countries. In the first case, the delay caused by the moist air deprives the plant of the advantages derivable from the moist soil, and the period of flowering is very much retarded. In the second case, the advantage consequent on the dry air brings about an earlier flowering. The two favourable conditions may be realised in southern countries by irrigation, the results of which are as every one knows very remarkable. To sum up, it may be said that dry air is very favourable to the production of flowers; moist soil is favourable; dry soil is unfavourable, moist air very unfavourable to flowering. The full details may be read in a recent number of the *Comptes Rendus*, p. 890.

BAUHINIA GRANDIFLORA.—We learn from the *Revue Horticole* that this magnificent plant has flowered for the last four or five years in the open air at the Botanic Garden, Lisbon. Young plants have also been obtained from seed.

CACTUS CULTURE.—Mr. F. A. HAAGE has published an excellent little handbook on the culture of Cactus and allied plants, illustrated by numerous woodcuts. The treatise is published by the Schleisische Buchdruckerei of Breslau, and may be obtained from Messrs. WILLIAMS & NORWATE. Descriptive lists are given, and the woodcuts are excellent.

CHRYSANTHEMUMS.—The Chrysanthemum fever seems to rage as severely in the United States as here, if not more so. The *American Florist* has a special number, with a long list of varieties, accompanied by critical remarks and numerous photographic illustrations. The flowers, do not, however, lend themselves well to this kind of representation. The new comer, *Gardening*, has caught the fever, as was to be expected, and also makes a brave show of illustrations.

DEVON AND EXETER GARDENERS' ASSOCIATION.—At the fortnightly meeting held on November 30, Mr. JAS. MAYNE, gardener to the Hon. MARK ROLLE at Bicton, gave a paper upon "The Cyclamen and the Bouvardia: their Culture and Value as Decorative Plants." The subject created much interest, and a long discussion ensued.

THE LATE JOHN DOWNIE.—The enthusiastic horticulturist who was laid to rest on Tuesday, November 29, was the originator of the Fancy Pansy, and raised millions, probably, of seedlings, in his endeavours to improve that flower. In 1844 he and the late Mr. JOHN LAMONT, were the prime movers in starting the Scottish Pansy Society, which still carries on with success its annual show in Edinburgh; and the same two gentlemen, a year or two later, started the Scottish Dahlia and Hollyhock Society, which was carried on for about a decade. About the end of the "forties," Mr. DOWNIE became President of the Scottish Gardeners' Society, which held shows annually with much success for seven years in a large tent erected in St. Andrew Square, Edinburgh.

POISONOUS PROPERTIES OF HOMERIA AURANTIACA.—Baron Sir FERD. V. MUELLER writes:—"It has been known—in South Africa, at all events—for the last few years that the *Homerias* are deleterious to pasture-animals there, but that danger to herds or flocks may arise from these unsuspecting-looking plants beyond their native country has now only been ascertained. *Homeria aurantiaca* has shown itself as easily naturalised and as apt to spread in the colony of Victoria. Near Melbourne, cattle died lately on pastures infested with this plant. It does not seem that the generality of South-African *Irideæ* are hurtful; but as the *Homerias* are favourite garden plants, it would be well that horticulturists in climates where the *Homerias* will grow in the open air should be warned, so that these dangerous *Irideæ* do not get free scope to stray away from gardens. Indeed, it would be best to discard them as ornamental plants in any country not having severe winters."

LECTURE ON HORTICULTURE AT BECKENHAM, S.E.—Professor CHESHIRE, in the course of a lecture at Beckenham on Tuesday, November 22, alluded to the subject of the deficiencies of the soil in regard to certain items of plant food. Mr. CHESHIRE said he was trying to find ideal manures, which would be more perfect in their character than anything they had hitherto used. The three principal ingredients of which the soil was likely to be deficient were nitrogen, potash, and phosphorus, and for the purpose of testing which of those were required, he advised them to take four flower pots, and representing these elements as one, two, and three, to put some mould into the pots, and mix the manures one and three, one and two, two

and three, and so on, and then plant half-a-dozen Barley seeds or some other, and see in which pot they grew best, and by this process they would be able to tell what the soils wanted most.

THE GARDENERS' ORPHAN FUND, AND THE RUGBY CHRYSANTHEMUM SOCIETY.—We are requested by Mr. W. BRYANT, Secretary of the Rugby Chrysanthemum Society, to express his thanks to all exhibitors at the show, and others who so generously contributed flowers, fruit, plants, and vegetables in aid of the Gardeners' Orphan Fund, and to announce that the sum accruing from the show amounted to £9 2s. 6d., and a cheque for this sum has been forwarded to the Secretary of the Fund.

—The monthly meeting of the committee took place on Friday, the 2nd inst., W. MARSHALL, Esq., in the chair. Among the special receipts announced were the following:—Bristol Chrysanthemum Show, per Mr. J. H. Vallance, £1 10s. 8d.; the Woolton (Liverpool) Gardeners' Mutual Improvement Society, proceeds of concert, per Mr. R. G. Waterman, Treasurer, £6; the Chiswick Gardeners' Mutual Improvement Society, proceeds of concert, per Mr. T. Waugh, Treasurer, £21 15s.; Mr. T. Miller, Margate, collecting box, 4s. 6d.; Mr. R. Scott, Manningham, Bradford, box, 19s.; Romford Chrysanthemum Show, box, per Mr. R. Farrance, 9s.; Wimbledon Horticultural Society, per Dr. Walker, 14s.; Mr. E. Hillier, Winchester, box, 5s.; Mr. W. Marshall, box, £1 7s. 3d.; Mr. W. Poupert, Twickenham, box, £2; and Mr. J. Smith, Mentmore, box, 8s. 6d. Having regard to the financial position of the fund, the committee resolved that an election of eight children upon the fund should take place at the annual meeting in February, and the Secretary was instructed to issue the necessary advertisements to that effect. A vote of thanks to the chairman closed the proceedings.

WORCESTERSHIRE UNION OF WORKMEN'S CLUBS AND INSTITUTES.—We publish with great satisfaction the following extracts from the report on Gardening Instruction Scheme for year ending September 30, 1892:—"Mr. JAMES UDALE, F.R.H.S., was selected as the gardening instructor, and commenced work on September 21, 1891. For the ten months of actual work in Worcestershire, the Instructor has sent in monthly reports of work done, and these are worthy of notice. It should be remembered that according to the scheme submitted to the County Council, the services of the Gardening Instructor were made available, without charge of any kind, to every cottager and allotment holder in any district where is a club or institute affiliated to the Union. Mr. UDALE has also been authorised, while making the above his first care, to visit, when time permitted, market gardeners, farmers, and others. In parishes where no institution existed, a small annual fee to the Union of 5s. has secured the Instructor's services. There are not wanting signs that many villages are waking up to desire the benefits which their neighbours have enjoyed, and are anxious for visits from the Instructor. In the ten months, Mr. UDALE'S work has extended to forty-five towns and villages in the county. To give a list of these is to show under what great variety of condition and circumstance gardening has to be carried on in Worcestershire. From the borders of the Black country where, in gardening phrase, you must 'ask things to grow,' to the fertile districts of the centre and south, where 'you can tell them to grow,' is a very wide leap. Between these two extreme points there lie every variety of soil and situation, with a yet greater variety of class and occupation from which the gardeners are drawn. The Gardening Instructor's work has two sides. Where required, he gives addresses on various subjects connected with horticulture. Whenever he can, he visits gardens and allotments when the cultivators are at work, to aid them by practical suggestions, and to induce questions which he is glad to answer. With regard to addresses, sixty-one in all have been given, the subjects being as follow:—1, Soils; 2, Seeds; 3, Green Crops; 4,

Small Fruits; 5, Potato Culture, with a view to the prevention of disease; 6, Large Fruits; 7, Root Crops, other than Potato; 8, Insect Pests; 9, Planting and Pruning Roses. The average attendance at each has been thirty-seven. In addition, several conversational meetings have been held at various places; but it appears that an address on a given subject, followed by discussion thereof, is most popular and most likely to be useful. It may here be added that, with the present season, the Council of the Union have issued abstracts of each lecture given by Mr. UDALE; and every person present at a lecture receives a printed copy of its substance, as an aid to memory and a help to practical knowledge. Mr. UDALE has paid 343 visits to cottage gardens, 155 to fields of allotments (in which, on an average, there may be twenty separate allotments), and 197 to market gardens, fruit farms, orchards, and other gardens. These visits represents a distance covered, by walking alone, of about 2000 miles. In value they may be already measured by improved crops in many parts; by more intelligent cultivation; and by the welcome which is given by an increasing number of gardeners to the Gardening Instructor. A few special points touched upon in Mr. UDALE'S Reports are given here:—(1) He observes that men of all classes have given him a hearty welcome, and that he is indebted to many market gardeners and owners of large gardens for opportunities of increasing his own experience. He finds that those who know most are most willing to learn more. (2) He finds the desire for addresses and object lessons to be on the increase. (3) Deeper digging of land is becoming more common, to the great advantage of the cultivator. (4) He commends the excellence of many cottage gardens at Pedmore, and of allotments at Clent and Droitwich; and draws attention to the system adopted by the Hagley and District Gardening Association, and to that of the frequent exhibition of produce at the Aston Fields Club. (5) He observes that in many parts of the county, among both cottagers and market gardeners, there is room for much improvement in fruit culture, and especially as regards insect pests. (6) In August he finds more preparation being made in planting of vegetables for winter and spring consumption. (7) In September, the result of a year's study of the allotments in the county is given. He expresses a strong opinion of their value, where the position is convenient, the land of average quality, and the rent a fair one. With a few exceptions, he considers that the Worcestershire allotments are not let at unreasonable rents; and he expects to see a growing demand for $\frac{1}{4}$ acre and acre lots. It should be stated that the Council are anxious that farmers and market gardeners should make full use of the trained knowledge as to orchards and fruit trees which Mr. UDALE possesses. In conclusion, it may be added that, since September, Institutions have been affiliated to the Union in six fresh districts; and there seems every prospect that, as the solid benefits of the Gardening Instruction Scheme are better known, a demand to participate in them will arise from all parts of the county."

H. T. STANTON.—The death, in his seventieth year, of this eminent entomologist is announced. Those who were privileged to know him, will recognize that not only one of the most learned, but one of the kindest and gentlest of scientific men, has passed away. For some years Mr. STANTON acted as Secretary to the Linnean Society.

VINE CULTURE AT DUFFEL AND WAVRE STE. CATHERINE.—Belgian Vine culture has been heavily burdened by the new French customs duty, which taxes Belgian Grapes at 1 fr. 50c. the kilo. (about 7d. per lb.). The well-known establishments of Hoeylaert, near Brussels, are not the only sufferers from this. For many years numerous vineries have been built at Duffel and Wavre Ste. Catherine, both of which localities send freight by the Antwerp and Brussels Railway. We recently visited the principal Vine-grower of these places, M. LOUIS SELS, who frequently shows fruit at our exhibitions. His

grounds at Duffel comprise thirty-four houses at least, 162 feet long by from 19 to 22 feet wide, and devoted to Vines, Peaches, and Strawberries. The firm turns out annually 10,000 pot Vines and 20,000 to 25,000 pot Strawberries; last year the total rose to 31,000. There are 120 sorts of Vines, of which the following are the best:—Alphouse Lavallée (black), Black Alicante, Bwood Muscat (white), Buckland Sweetwater (white), Bruxelloise (black), Chavouste (white), Dr. Robert Hogg (white), Frankenthal, Forster's White Seedling, Gros Colmar, Madresfield Court, Black Muscat, Marquise d'Hasting (white), and Morillon d'Espagne. Among the novelties are Dodrelabi (black), Parc de Versailles (white), San Antonio (black), and Wilmot's Hambro (dark red, shading into clear blue). The Grapes are chiefly sent to Antwerp and Brussels. The Grape-forcing houses are warmed by a series of moveable pipes, which can be transferred from one house to another as they are required. This system is an invention of M. SCHMIDT, which is now on trial in Belgium. Tomatos are also grown here. Against the disease Bordeaux Mixture has been successfully tried. There is also a large house for forced Roses; it will be only possible to compete with the supplies from Nice if the Belgian blooms are ready at the New Year. At Wavre Ste. Catherine there are thirty-one houses, at least 99 feet long by 23 feet wide. There is also one 474 feet long. Only the best sorts of Grapes are grown here, Frankenthal is most highly thought of. There are two forty-horse-power engines, circulating water for watering, and hot water and steam for warming all the houses. The vineries are ranged in rows about 32 feet apart; this causes considerable waste of heat and time. Before M. SELS had charge of this establishment, each house was warmed by four stoves; the flues were of brick. Now the most modern improvements have been substituted in both the watering and heating systems. All the houses are in full working order. Besides these two establishments, M. SELS has three or four others at Duffel, comprising about forty houses, so that altogether the vineries at Duffel and Wavre Ste. Catherine are contained in a hundred houses covering 28,000 sq. metres, and with a total glass area of 40,000 sq. metres (1 sq. metre = 10.764299 sq. feet.) *Ch. de B.*

SMITHFIELD CLUB CATTLE SHOW.—At the annual Cattle Show held this week in the Agricultural Hall, Islington, the leading seedsmen were as usual represented by large stands of well-grown roots and vegetables, and samples of seeds of grasses, &c. Particularly noticeable were the exhibits of Messrs. Sutton & Co., Reading; E. Webb & Son, Stourbridge; Messrs. Carter & Co., Holborn; Messrs. Dickson & Co., Chester; Messrs. Harrison & Son, Leicester; The Agricultural and Horticultural Association, Limited; Messrs. Jarman & Co., Chard, Somerset; and Mr. Walter Parsons, Reading. Some fruits were shown by Messrs. J. Cheal & Sons, Crawley; and cider Apples, &c., by Gaymer & Co., Barham, Attleborough.

TREE PLANTING IN IRELAND.—The Irish Land Commission, encouraged by the success of their operations in this direction last year on the west coast of Ireland, have been induced to extend the woods in the exposed district, and are importing large quantities of forest trees from the principal nurseries of the country; and Messrs. LITTLE & BALLANTYNE of Carlisle, among others, have been requested to furnish a great number.

PRESTON AND FULWOOD HORTICULTURAL SOCIETY.—At the monthly meeting of this Society, which was held at the "Old Legs of Man," in Preston, on Saturday night, the discussion on the Culture of the Tomato was resumed. Mr. HATHAWAY, gardener to Lord LATHAM, who had introduced the subject, subsequently answered a great number of questions put to him by cottagers, amateurs, and nurserymen. A cordial vote of thanks was accorded to him. There was the usual exhibition of plants, &c., Chrysanthemums forming the larger part of the display. It is suggested by several leading members

of the Society that the funds should be utilised, as far as possible, in securing the engagement of a Professor of Botany to give scientific lectures to members. If this is done, it is expected a grant will be received from the Lancashire County Council towards the cost.

NOTICES OF BOOKS.

AGRICULTURAL GRASSES.

THE Department of Agriculture, Division of Botany, of the Washington Experimental Station, has just issued (October 20, 1892) the first part of a most valuable work, by Dr. Geo. Vasey, which includes plates and descriptions of the Grasses of California, Oregon, Washington, and the north-western coast, including Alaska.

The author in his introduction states, that the grasses which are known to grow on the Pacific slope of the United States, including Alaska, number not far from 200 species. These are all specifically distinct from the grasses growing east of

the Mississippi River, and also mainly distinct from the grasses of the plains and of the desert, except in that part of California which partakes of the desert flora.

A considerable number of the grasses of the mountain regions of California, Oregon, and Washington reappear in the mountains of Idaho, Montana, and the interior Rockies. The interior of California is a dry region, verging in the extreme south into the desert country, and is deficient in grasses, especially of those species which form a continuous turf. In the present issue are figured and described mainly those grasses which are most conspicuous in size and apparent utility.

Nearly all are thus illustrated for the first time; consequently, the work will be of great value not only to botanical students, but to all those persons interested in agriculture and in the raising of domestic farm animals.

HANDBOOK OF THE IRIDÆ. By J. G. Baker, F.R.S., Keeper of the Herbarium, Royal Gardens, Kew. (Bell & Sons.)

This, we are told, is the last of a series of botanical handbooks on which the author has been engaged since coming to Kew in 1866. At that time he found that the "groups of plants that enter largely into horticulture that most wanted working at were the vascular Cryptogams and the petaloid Monocotyledons." Accordingly, Mr. Baker first turned his attention to the Ferns, then to the Liliaceæ, of which a monograph is contained in the *Journal of the Linnean Society*, vols. xi. to xviii., to the Amaryllidæ, the Bromeliaceæ, and now to the Iridæ. What all this means in the way of careful research, accurate comparison, and patient toil none can appreciate, save those who have undertaken similar tasks. When done it is not work which attracts attention or secures credit for the author from the public, still less any more substantial reward. On the other hand, he has the satisfaction of knowing that he has done a good work which will last for years, and that successive generations of botanists and horticulturists most turn to his pages and profit by them, long after the most popular novel of the day has been consigned to oblivion. Mr. Baker's object has, from the first, been eminently practical. He saw at once, that what was wanted was a general guide, in which the salient and prominent features of each group should be so presented as to be readily recognised. These landmarks established, the further sifting is a mere matter of detail. When once the map is constructed showing the main highways and turning points, the smaller streets and alleys can readily be filled in by the patient student. We may, therefore, look on Mr. Baker as a surveyor or map-maker, and value his labours accordingly. Many of Mr. Baker's forecasts have been published in our own columns, so that we are in a position to know what services he has rendered to botany and horticulture. In the present volume 161 species of Iris are described, 66 species of Crocus, and 132 species of Gladiolus. The other genera, of which there are fifty-four, have a smaller number of species. With his contributions to the *Flora Brasiliensis*, his numerous papers on the flora of Madagascar, his *Flora of Mauritius*, it will be seen that Mr. Baker's labours have by no means been few or unimportant, and though he speaks of the present as the last of a series, we may yet hope to give that statement a limited interpretation only, and to hope that his work on the *Monocotyledons of South Africa* in continuation of Harvey and Sander's *Flora Capensis*, may soon see the light.

THE GREAT WORLD'S FARM. By Selina Gayer, with a Preface by G. S. Boulger, F.L.S., &c. (Seeley & Co., London.)

This book gives an "account of Nature's crops," and of the various forces which aid in their establishment and growth. The "crops" are understood to comprehend all vegetables ranging from lichens to forest trees, and the articles chosen for description are such as are especially beautiful or curious. The

style of the book is so simple, as to render it as suitable for a child as for an adult. There are some exceedingly pretty illustrations, which add much to its attractive appearance. It is well printed, and neatly bound.

AN INTRODUCTION TO THE STUDY OF BOTANY.

By Arthur Dendy, D.Sc., F.L.S., and A. H. S. Lucas, M.A., &c. (Melville, Mullen & Slade, Melbourne and London.)

Unlike many other elementary books on botany, the volume before us treats of the microscopical structure of plants, as well as of their development and classification. Especial attention is paid to such species as the Australian student is most likely to meet with, since for him the book is primarily intended; the authors beginning with the study of Protococcus and Bacteria, and leading gradually on to the more complicated monocotyledons and dicotyledons. There are a full index (of terms, &c.), and plentiful illustrations. It is a book of convenient size, and pleasantly written, and is altogether one of the best books of its class that we have seen.

ANIMALS' RIGHTS. By Henry S. Salt. (George Bell & Sons, London and New York.)

This book might with equal propriety have been called "Animals' Wrongs," since it is chiefly a tirade against the injustice done to dumb creatures by "silly women, half-witted sportsmen, and half-enlightened scientists." The author would anticipate the millennium; until then, few can or will be so wise as to refrain altogether from profiting by the labours and lives of animals lower in the scale than man. In the meantime we must use but not abuse our privileges.

NEW VEGETARIAN DISHES. By Mrs. Bowdich. (George Bell & Sons, London and New York.)

We have here a collection of about 200 recipes, some of which will be acceptable to both vegetarians and meat-eaters. The latter are, however, hardly likely to be converted to the writer's principles by dainties such as "Brussels Sprouts' Sausages," "Cabbage Salad," or "Tasty Greens."

THE LADY FERN (ATHYRIUM FILIX-FEMINA).

THE Lady Fern, which is at once one of our commonest, and at the same time one of our most beautiful native Ferns, is a peculiar Fern in many ways, apart from its external specific features. In the first place, though one of the most variable of plants, and by no means dainty in its requirements, since if only its roots can be supplied with sufficient moisture, it grows in the most diverse situations, it is a member of a very small genus, which presents but little difference in form in the species of which it consists. This is a curious fact when we consider the immense diversity of type into which one familiar species has sported under quite natural conditions, which would lead us to expect that the genus itself, in its process of adaptation to environments all over the world, would have split up into numerous very distinct specific forms. If we take the genus *Asplenium*, to which some botanists consider the Lady Fern allied, we find precisely the converse case. Here the species, which range through an infinity of distinct types, from the simple grass-like *A. septentrionale*, to the huge *A. nidus avis* or Bird's-nest Fern, though comparatively constant, sporting very little indeed, are very numerous, no less than ten species being indigenous to Great Britain, while about 200 figure in Smith's *British and Exotic Ferns*, a list which has certainly been swelled considerably since its publication.

A second peculiar feature of the Lady Fern is its indefinite generic character, so far as regards its fructification, which in most of the plants approximates in appearance to the lineal sori of the *Asplenium*, in which genus it is on that account placed by some botanists. The sori, however, as well as the indusia, or spore covers, are always short, and

more or less curved, à la horseshoe, so that in extreme cases the indusium, barring its ragged edge, resembles superficially the kidney-shaped one of the *Lastrea*, or Buckler Fern. One, to the writer's mind, indubitable member of the family, the Mountain Lady Fern, or *Polypodium alpestre*, has no indusium at all, so that, despite its obvious affinities to another species, it is on this account assigned by most botanists to the *Polypodium* family.

Certain abnormal forms, however, which are characterised by extra leafy development, such as the *Horsfall plumosum*, found in Yorkshire, bear also round and perfectly nonindusiate sori, and other forms have the indusium so ragged and imperfect that sharp eyes are required to detect its presence at

Thus would be recognised its one point of resemblance to another genus, while not on that account ignoring a dozen equally obvious ones which betray its true relationship. Another, and perhaps the most salient feature of the species, is its extreme variability. So great is this, that in many places it is difficult to find two plants of precisely the same character. The accepted and predominant normal type has large fronds of lanceolate outline, bearing long, gradually tapering pinnate pinnae, the edges of the pinnules, or subdivisions, being more or less serrate, or saw-toothed. The fronds spring from a central caudex, or crown, somewhat erectly and in a circle, à la shuttlecock. A very superficial examination, however, of a bank or ditch lined with this

Apart from the minor variations described, a veritable host of most extraordinary departures from the average normal type have been found growing wild in various parts of Great Britain, and among these eccentric forms are several, which are so far quite peculiar to this family, extraordinary as are the sports which have been found in most of the other species. A. f.-f. *Frizelliae*, found in Ireland, is one of these remarkable aberrations, since instead of a broad, bipinnate, feathery frond of lanceolate outline, the fronds are mere midribs, with nearly round, dense knobs placed alternately on each side, and terminating abruptly without any gradation whatever. A greater transformation can hardly be conceived. Another form, A. f.-f. *Pritchardii*, is an

FIG. 110.—RHODODENDRON ROYLEI: FLOWERS CRIMSON. (SEE P. 698)

all. Hence, we have a species, which in its general characters is one of the easiest to recognise from all others, confused with two widely-different genera with which it has no affinity whatever. This is a glaring instance of the incongruities which unavoidably step in when a hard and fast classification is attempted to be based on any one feature. Ferns are classified mainly by the peculiarities of their fructification, and in the large majority of cases this is found to be the best line to go upon, but where Nature ignores this line, and a plant appears with an intermediate and uncertain specific character of this sort, its other characters, if marked enough, should determine its placement, and where it apes the one feature of the *Polypody* fructification exactly, but still sticks to a dozen other *Athyrium* characters, surely it does not cease to be an *Athyrium*, but might fitly be named specifically *A. nudisorum* or *polypodioides*.

Fern, will show divergencies of all sorts, some being much finer cut, some more erect, and some more decumbent. A frequent form is erratic in its subdivisions. Some form dense clumps by constant subdivision of the crowns. They vary again in texture, and in fact it is difficult, as we have indicated, to find any feature which is constantly alike. The fructification varies, as we have seen, from well-developed indusia to none at all. If, however, we turn to one of its more frequent companions, the male Fern (*Lastrea filix-mas*), we may find hundreds and thousands of plants in which even the most critical eye could detect no dissimilarity. It is, indeed, the same with most of the other genera; there is a certain well-defined type, which, though varying a little in different districts, is sufficiently constant generally for a standard description to be valid. This variability in the *Athyrium*, however, by no means ends here.

approach to this, the pinnae being shortened and multiplied so that they are in little radiating bunches along the frond, which also tapers gradually. A kindred form, A. f.-f. *Fieldiae*, is intermediate between these two, the bunched pinnae being shorter and the frond abruptly terminated. The radiating form of pinnae, which, from the opposite pairs forming crosses is termed cruciate variation, is developed to the greatest perfection in that extraordinary Fern known as A. f.-f. *Victoria*, found in Scotland. In this the fronds are long and very slender, and bear a long, much-divided tassel at their extremities; the pinnae, instead of being single, are in pairs, and set on at nearly right angles to each other. They also are very slender, and bear tassels smaller but of like character to those at frond tips; finally, the ultimate small divisions are also set on in pairs at the same angle, so that the whole frond consists of deli-

cately cut crosses, built up of smaller ones. It can scarcely be credited that such a marvel of variation, and so beautiful a form, should have remained unmoved for two years after its first discovery by the roadside; yet such was the case.

The spores of this variety, which are produced in abundance (we gathered, on a moderate computation, eighteen millions from six withered fronds), yield plants fairly true to type, but almost invariably coarser, and of smaller growth, no frond exceeding about 2 feet, while the division of the original frond in our possession grows to about 3½ feet. No Fern in the world has yet been found to rival this in complex variation, i.e., such a combination of delicate tasselling, with creculation to the utmost. In the simpler forms of tasselling or creculation, the species has afforded every imaginable type, from the really marvellous *A. f.-f. acrocladon*, found on a Yorkshire moor, in which the midrib of the frond divides and divides until a ball of foliage is produced instead of a feather, to some of the simpler multiceps or furcate varieties, where all the terminals are merely forked. In some of the forms, such as *percristatum*, *Cousens*, even the pinnules are delicately crested, and in a *percristate* form of *setigerum* raised by Col. Jones, these are fanned out broadly, and fringed with innumerable bristles. Then, in another direction, there are the small and densely-congested varieties of *A. f.-f. stipatum* Grante and *A. f.-f. Edwardsii*, the latter a veritable gem of vegetation, and a type of the dwarf varieties which would make charming collections for limited spaces in many a shady nook and corner where nothing else will thrive. The delicately crispate form known as *Vernonia*, and its crested offspring, constitute another section, and did space permit, a score of other types might be mentioned and described. We must not omit to mention that unique Fern, *A. f.-f. kalothrix*, or beautiful hair, in which the fronds of normal outline are built up of the most delicate glass-like, silky filaments. No description can do it justice; it must be seen to be appreciated. Of these, it is noteworthy that the great majority, if not all, of the typical forms have been found wild, and wide as the departure has been from the normal type in most of them, intermediate forms are conspicuous by their absence, the "sport" wonderful as it seems, having been arrived at by one jump, as it were. In our own hunting experience we have, it is true, found some slight evidence of transitional variation in the shape of partially-affected plants or sportive offsets attached to nearly normal parents; and in one of our finds in another genus (*Lastrea montana*), which was exhibited at Westminster Drill Hall last year, a distinct and gradual change of varietal type was shown in progress. These cases, however, are very rare; and, after all, the wonder is not less that a plant should gradually assume, as it were, a different architectural plan, than that a spore from a normal parent should have that structural alteration incorporated with it, and so yield at once a resultant perfect variety. Under artificial conditions, it is a well-recognised fact that spores and seeds gradually have their stability of type subtly affected, so that in a few generations the liability to "sport" in their progeny is largely increased. To this fact we owe a great number of our countless floral forms, and we find the same thing to obtain in Ferns; the spores for several generations yielding true progeny, then a break occurs, and an advance in the type is obtained in the direction of finer cutting or larger creculation, and so on. This stage reached, the progeny of the secondary sport will probably be very diverse, the parental type being altogether absent or in the minority. In one case of this sort, a secondary plumose sport of a Lady Fern (*A. f.-f. plumosum elegans*, Parsons, raised from the *Axminster plumosum*) gave only two true plants, all the rest being quite different, and heavily crested, a feature entirely absent in the parental form. Spores of one of the best of this crested batch gave a predominance of non-crested plants of all degrees of delicacy of cutting, one of which is actually five times divided, eclipsing even *Todea superba* in foliose dissection. The first form of variation we

described, *A. f.-f. Frizellia*, acted similarly shortly after it came into cultivation, one nurseryman filling a house with divergent forms, and exhausting the dictionary in his endeavours to christen them all. In such cases it is obvious that careful selection alone can obviate the risk of a surfeit. As well might our *Auricula* or *Dahlia* growers stage all their seedlings, and dignify the worst of them with names as ugly and as long. Of late years, in the hands of Col. Jones, Mr. Fox, Mr. E. J. Lowe, and others, hybridisation or crossing has been found available for combining distinct types, which widens the horizon to infinity, and makes our last remark still more obligatory upon cultivators.

A word as to culture. As we have said, this Fern is by no means dainty in its requirements, it will consequently thrive in the commonest garden soil provided it does not get dry at the roots. Its favourite natural habitat is in very moist—even boggy—situations, and here, if sheltered from the wind by surrounding trees, it will grow 4 feet and more high, and attain its finest development. As regards outdoor culture, much depends on the locality; in our humid western counties, it will take care of itself almost anywhere—but in the dried eastern ones, it needs selected secluded nooks. The varieties in the large majority of cases require the protection of glass to enable their more delicate characteristics to appear. A beautiful form exposed to wind, heavy rain, and it may be scorching sun, would probably become a stunted unsightly specimen, while given a post of honour in a cool greenhouse, it would amply justify its position. It must not be coddled, a warm house in winter is death to it, depriving it of rest, and stimulating premature growth; the summer will see it an exhausted wreck and prey to every kind of vermin. As it is deciduous, the best plan when it dies down in autumn, is to plunge the pots in some damp corner. Frosts will not damage them, and in March they can be reinstated, and will speedily form finer and finer specimens. *Chas. T. Druery, Fernholme, Forest Gate.*

SELECT DECORATIVE FOLIAGE PLANTS.

Among the great variety of variegated and other beautiful foliage plants such a diversity of colour exists, that a bright and attractive group can be made without the aid of flowers at all. I prefer to exclude flowers from a group where plenty of bright-coloured foliage can be had, for, I think, that flowers (especially coloured) do not harmonise with *Crotons*, *Dracænas*, &c. In groups of flowering plants, green foliage, if used liberally, has a pretty group, or if white flowers are not plentiful, some white variegated foliage, such as *Cyperus alternifolius variegata*, or *Enlalia japonica variegata* may be used, and *Panicum variegatum* makes a nice edging.

The craze for large specimen plants has nearly died out, and it is hardly necessary to say that young healthy well-grown plants are in every way preferable to the over-grown plants one used to see carted from one show to another, year after year, and which are of no value for any other kind of decoration.

Most foliage plants may be propagated with little trouble where ordinary accommodation exists, but, notwithstanding this, I am afraid that in many establishments due attention is not paid to the necessity of providing young stock, and old plants are kept lingering on until they become quite unsightly. This particularly applies to *Crotons* and *Dracænas*. It is, perhaps, owing to indifferent examples which are often seen, that *Crotons* have not been so popular as they deserve to be. However, foliage plants generally are coming more and more into use, and even sprays of cut foliage are in demand, especially good variegated kinds.

In this paper on useful foliage plants I shall give *Crotons* the first place. From the great number of varieties now grown it is difficult to make a selection without at the same time making it too extensive,

especially as under different conditions the sorts vary considerably. For table decorations the selection should be confined to the narrow-leaved sorts, but for grouping, or for places where they are only seen at a distance, the larger-leaved sorts will be found more effective. Of the narrow-leaved sorts, *Countess* is one of the most useful, the long drooping leaves are beautifully marbled and spotted with golden yellow; it is a free-growing sort, and may always be relied upon to keep in good colour. *Superba* closely resembles the above-named, and when well done, it is even more elegant, but it is not quite so easy to manage. *Chelsoni* is a very elegant little *Croton*, but too delicate for ordinary work. *Aigburthensis*, of slender habit, with long, narrow, recurved leaves, marked with linear band and spots of pale yellow. *Ruberrimus* is somewhat after the well-known majestic, but more compact in growth; the narrow leaves are slightly twisted, and change to a deep almost crimson hue. *Flambeau* is another, in which the deep yellow variegation changes to a bright red shade. *Mrs. Swan* is a distinct variety: the stems and leaf-stalks are rosy-red, the rather narrow recurved leaves have a linear band of clear yellow; this variety makes a very pretty table-plant. *Massangana*, prettily marbled leaves of pale yellow, shaded with red; leaf-stalks and midrib very brightly coloured. Of the larger-leaved sorts, *Thomsoni* is a good one; the leaves are three-lobed, pale green, with a broad linear marking of clear yellow. *Mortefontaineensis* has leaves beautifully veined with yellow, changing to bright red; although a little stiff in habit, it is a most desirable variety, on account of its colouring so freely. *Etna* is another very bright variety. *Comte de Germiny*, large ovate leaves, veined and blotched with bronzy yellow, changing to red. *Fleming* has medium-sized ovate leaves, broadly blotched with yellow, changing to an almost crimson hue. *Musnicus*, medium-sized leaves, veined and blotched with yellow, shaded with red. *Bergmanni* has large ovate leaves, with broad linear band, and veined with creamy-white, and is very effective. *Gordoni*, leaves broad at the base, narrowing off almost to a point, beautifully blotched with red; even in quite a young state this is very bright. *Warreni*, has long, pendulous, twisted leaves blotched with yellow and shaded with red. *Gloriosus* is a good companion to this; it has leaves of pale green, blotched and veined with creamy-white. I had intended to confine myself to a dozen sorts, but find I have already considerably exceeded that number, and still there are some I should like to include.

In the culture of *Crotons*, it is necessary to start with well-coloured tops for propagating from. Cuttings may be taken at almost any season of the year, but the best time is during the winter, while the plants are in a restful state. Good-sized tops may be taken; they should be put in singly in small pots, using light sandy compost, and a little extra sand at the base of the cuttings. They require a good brisk bottom-heat, and to be kept quite close. If plunged in moist cocoa-nut fibre refuse, they will not require much water for the first few days, and, with a little care, they will root without losing a leaf. In growing the plants on, it is necessary that they should be well exposed to the light, have a higher temperature than is given for most stove plants, and plenty of atmospheric moisture. This is essential both to encourage growth, and to keep down the red-spider and thrips, to which the *Croton* is especially liable?

(To be continued.)

HOME CORRESPONDENCE.

EARLY PEAS.—Your correspondent, "W. A. C.," recommends the spring, or rather, winter sowing of Peas instead of autumn, and I fully agree with what he writes on this subject, having myself tried, and seen others try, both methods for many years past in gardens in Wiltshire, Surrey, Middlesex, and Hertfordshire, and I have noticed miserable failures when the plan of winter sowing has been

adopted, and at the best nothing gained in point of time. I have for many years ceased to depend upon either one or the other, and my practice now is to sow for the first crop on turves about 2½ inches wide, and the same in depth, cutting a V cleft about 1 inch deep in each piece of turf, which is usually cut about 1 foot long. In these clefts I sow the Peas thickly, and press some light soil or the potting-bench siftings over the seed. The turves are placed upon boards, and carried to a vinery or any cool-house about February 1. The Peas soon come up, and when they are duly hardened off, planted out just as they are when about 3 inches high, care being taken to press the soil about them firmly. In the generality of years we begin to gather from these plants about June 8 to 15. Our soil is stiff and cold. If sharp frosts threaten, or the wind is very sharp just after planting the Peas, the rows are staked at once, and a few bits of Yew put in between the Pea-sticks, but not so as to unduly shade the Peas. I sow the same kind of Peas outdoors on the same date that I sow on the turves, which sowing is about three weeks later than those. To protect from mice and birds, I wet the Peas before sowing them, and roll them in red-lead, so that it adheres to them. This year the first dish was gathered on June 8, and with fine varieties we continued to pick Peas daily till the end of the month of October. The best are Dickson's 1st, Early Sunrise, Champion of England for main crop; Ne plus Ultra and Veitch's Perfection for late use. I know on some soils and in many situations this would be impossible. I may add that our soil is well cultivated, and the Peas are grown in the alleys between the beds of Potatoes of the previous year, and stable-manure is put into the soil, short grass from the lawns is put into the alleys upon which the Peas are sown, and never two years in succession. *D. Davis.*

ROOTWORK.—My experience of rooteries is not just identical with G. F. Wilson's as recently related in the *Gardeners' Chronicle* of November 12, and other gardening journals, in fact it is quite opposed to their use in the country garden, although in the half-wild garden or home plantation a rootery might be tolerated—and perhaps, in a town garden. I like all of our existing wild creatures in field and woodland, and when their depredations are not serious, or these are counter-balanced by the good they do in destroying worse foes, I would always preserve them. The rootery forms a safe retreat for the lively bunny, which I am quite safe in putting down as a "garden pest" of the worst kind, whose depredations in flower and kitchen-garden are too well known to need any description from me. The equally mischievous rat has a partiality for the rootery as a nice secure place of abode, for he there may defy ferrets, dogs, and the spadesman, issuing forth at night in search of fruit in frames, pits, on the wall, in the vinery or the fruit-room, or of Potatoes, Carrots, and what-not. The soil may be impacted firmly enough about the roots, but enticing hiding-places are always to be found by the two kinds of animals mentioned, and the continual decay of the wood affords, as time goes on, still more of them. Knowing all this, would an employer or a gardener be acting wisely in setting up a rootery in a garden? The same objection to a rootery holds good of rock-work when this is badly made, but the evils are seldom so serious, and may be overcome by filling in the likelier crevices and inlets to the interior of the same with stones, &c. *A. Y. E.*

NEW VARIETIES OF CULINARY PEAS.—It is somewhat surprising that so few state their experience of new varieties of Peas and other vegetables. Is this because those who grow them are afraid that others will surpass them in produce at shows, or is it because so few try them? I must confess that I used to be rather sceptical in trying any new kind until I had seen it grown by others, but of late I have taken to giving most of the new varieties a trial on their being sent out, weeding out those that are worthless and retaining only those of sterling good quality. New varieties of Peas with me have a particular charm, for I try nearly all kinds that are sent out each season. Last season the following had a place on my list:—Superabundance, a packet of this was procured and sown on April 9, in a drill 22 yards long, a tremendous length one would say for so few Peas, but I always sow thinly and cultivate the ground well. In due time the young plants appeared above ground, stakes were put to them about 4 feet high, the haulm soon grew to the top of the sticks, and the row appeared as though there had been at least a quart of seed sown in it. The pods were so abundant, and lasted such a long time in perfection, that

no less than 5 bushels were gathered; the pods were of medium size, deep green in colour, well filled with dark green Peas, which, when cooked, were of excellent flavour. This I considered a good all-round Pea, and one worth growing in every garden. Fame was also grown, but with me there were almost as many varieties as there were Peas in the packet, so I discarded that variety after the first trial. Next came Ambassador, which was a fairly good variety, but which grew rather too tall for the number of pods produced; the pods were a good size, it is true, but there were so few of them, that hunting would be a more appropriate name for gathering than picking, so few were the pods. Roger Cutler was another variety grown, and this, like Fame, had too many varieties in it for me to give it another trial. The Stanley Pea is a dwarf, free-fruited kind, with no one particular good quality. Empress of India was a good second early, grew about 4 feet high, the pods being of medium size, well filled, and of fine flavour; for a second early this is one of the best that I have yet tried. Exhibition also had a trial; the fine, dark, well-filled pods of this variety could not fail to attract the attention of all admirers of good Peas—the growth is robust and free in every way. English Wonder was sown early in the season by the side of Exonian and A I, but was far inferior to both kinds. Taking a review of the lot thus tried, I intend to retain Superabundance, Empress of India, and Exhibition; all the other kinds will be discarded. *H. C. Prinsep, Buxted Park.*

YELLOW HYBRID OF CHRYSANTHEMUM MAXIMUM.—In some notes on the variation of flowers in cultivation lately written for the Royal Horticultural Society, I remarked that in a garden in which accidental seedlings are generally allowed to flower where they come up, spontaneous hybrids between distinct species are of frequent occurrence. I have rarely, however, observed hybrids between members of different genera. At present I cannot recollect one which has come in my garden, except between *Chionodoxa Lucilic* and *Scilla bifolia*, until this autumn. But last September, noticing amongst some plants of *Chrysanthemum maximum* a seedling with abnormal leaves and habit, I potted it to flower in a greenhouse. It has now produced a yellow flower, new to me, which I can refer to nothing but a cross between *C. maximum* and *Anthemis tinctoria*, as these two plants grow together in the same quarters. *C. Wolley Dod, Edge Hall, Malpas.*

GARDENERS' ORPHAN FUND.—Amongst the many schemes to raise money in aid of this charity, there is one which seems peculiarly applicable at the Christmas season. Christmas has been appropriately called the Children's Feast. Let those, then, of the craft who can do so, think at this particular time of the children who are now receiving the aid of this Institution, and of the many more whose claims are none the less pressing, but whom the Fund, from want of means, cannot assist, and send in their Christmas-boxes, large or small, to cheer the lot and practically alleviate the wants and sufferings of these orphaned ones. The Christmas festivities will not be shorn one whit of their joys by such practical sympathy—rather will they be ennobled in the thought that the destitute little ones have not been forgotten. *J. B.*

ARTIFICIAL MANURES.—In a note on the Kent County Council on p. 675 of the *Gardeners' Chronicle*, reference is made to the difficulties which gardeners have to contend with in purchasing artificial manures. The variation in the quality of these manures is, I suppose, the principal grievance, and I think it is quite time inspectors were appointed by the government to examine all artificial manures and give a certificate of quality and composition as is done in the United States of America. In some parts of the Southern States artificial manures are used in very large quantities, as the soil is little better than pure sand; but there, if the cultivator does not get what he requires, it is his own fault; every sack or barrel of manure, whether a mixture or not, must have a label attached to it from the government inspector before it is sold, or the vendor is liable to a penalty. The label states the percentage of the various plant foods which the manure contains; and the endless mixtures are also graded by the inspector according to the solubility of the materials used, and their value to the cultivator. For instance, nitrogen derived from blood, would be considered far superior to that derived from horn-shavings, although the percentage might be exactly the same. The value of the mixtures offered for sale is also published in a list, and is calculated according to the prices per

unit of the chemical properties at New York; thus the purchaser is protected against overcharge. If the technical instruction now being given under the various County Councils continues, we may expect a more extensive use of artificial manures in the near future, and some means similar to the above ought to be adopted in order to protect the public from loss. The American system of land transfer and registration might also be studied by our authorities with great advantage. *W. H. Divers, Ketton Hall Gardens, Stamford.* [America is new, and is fitted with a brand new system of managing these things, whilst our system is the growth of centuries. We do not deny its disadvantages; and the American vainly longs for that which has the flavour of antique usage. *Ed.*]

THE ROYAL HORTICULTURAL SOCIETY.—The time approaches when the council will have to select its committees, and I trust that in making its selection one vital point may be undisputed, however much opinions may vary as to the relative preponderance of trade or amateur interests represented on these committees. This vital point appears to me to be, that no man labouring under the suspicion of illegal dealings, or who has passed through the Bankruptcy Court, or been in liquidation, or has made a composition with his creditors, shall (unless these unfortunate experiences are well known to have been caused by no fault of his own) be eligible for a seat on either committee. If the council thus selects men who are well known for their honourable independence, it will not only strengthen the hands of the committees themselves, but will render their decisions and judgments of far greater weight throughout the horticultural world. *Candour.*

THE GARDENERS' BENEVOLENT INSTITUTION.—In common with many others, I am pleased to see, by circular received, that some alterations are about to be made in the rules and administration of this most admirable institution; but as alterations without improvements are useless, I hope whatever is done may be of an acceptable and attractive nature, sufficient to enlist more general sympathy, and that will induce every horticulturist to join hand and heart in this laudable work. The committee will doubtless move a scheme already framed for working out; yet suggestions from outsiders may be acceptable, and as the meeting is near at hand, and the place of meeting too distant for many persons to attend, I think the columns of this journal a suitable medium in which to discuss and thresh out the question, and I hope it will please the Editor to grant space for ventilating and discussing the different opinions of correspondents. It might be well if the committee saw fit to give the best of their scheme for the consideration of the county members, for unless some sound practical inducements are brought forward, the young men will not enlist any more freely than has hitherto been the case. The alteration of title may not concern us so seriously as the cost and tiresomeness of soliciting votes under the present system of election, which I should like to see abolished, or only resorted to in the case of absolute incapacity of any deserving candidate, thus preserving the old title, "Benevolent." In other cases, I would advocate a form of superannuation, something after the fashion now in use by the principal railway companies, that members may expect to inherit by right rather than by favour; for although there may be very little in a name, the very term "Charity" is obnoxious. Again, as the Government is about to introduce a measure of easy insurance, which may become in time a serious rival to this institution, let us hope the committee will introduce a good and acceptable scheme of improvement which will afford satisfaction to the greater number of the craft. *J. H. Goodacre.* [We commend this subject to the attentive consideration of our readers. *Ed.*]

MULTUM IN PARVO.—The little piece of ground which forms the garden of Mr. Hugh Fraser, the foreman in the Leith Walk Nursery, and where his father lived before him, is full of interesting and a few rare plants. These are mostly on a rockwork, which is now being enlarged. Among them are *Barbarea vulgaris variegata*, *Juniperus hibernica nana*, *J. bermudiana* (which has stood out for ten years), *Saxifraga McNabiana*, *Gentiana verna*, *Andromeda japonica aurea*, *Berberis glumacea*, *Quercus Fordi*, and a full collection of *Helianthemums*. He has also a plant of *Rhus venenata*, the poison-wood of America, and a *Mutisia decurrens* is growing on the cottage. At the corner of the hedge, where it

could run up a Thorn, were the remains of the common English Bryony, Mr. Fraser said he brought from England because it did not grow wild in Scotland. Hooker says, "rare in the North." *Vagabond*.

COSTUS IGNEUS.—A fair-sized specimen of this plant is now in flower in the Birmingham Botanical Gardens, and the exceeding richness of colour of its brilliant deep orange-coloured flowers arrests the attention of visitors. The genus *Costus* is a rather extensive but little known one, and abounds in the moist regions of tropical America and Africa; and in Asia, *C. speciosus* is a great ornament in the forests of Bengal. The stem formation resembles that of the Ginger plant, *Zingiber officinale* forming a crown of leaves, from the centre of which the solitary flower is formed, and brings to one's mind the blooms of *Lychnis Haageana*, the flowers being quite 2 inches in diameter, and very striking in colour. It is growing in the stove. *W. D.*

A CURIOUS CYPRIPEDIUM.—Mr. Latham, the Curator of the Birmingham Botanical Gardens, has a reputation for seeding *Cypripediums*, and has now in flower a very singular variety, the result of a cross betwixt *C. Spicerianum* and *C. hirsutissimum*, and is growing in a basket. The dorsal sepals resemble *C. Spicerianum*, and the lateral sepals are almost white, with a streak of violet in the centre of each. There is no pouch, but a lower sepal instead, of a cream colour striped with chocolate. It has bloomed for three or four years, never varying in character, but in foliage and growth it partakes of the character of both parents. A pod of seed has again been impregnated with pollen from *C. Spicerianum*, with a view to a restoration of the pouch. *W. D.*

PEA AUTOCRAT.—When visiting the gardens at Spye Park on October 29 last, I noticed the above in good bearing, and also carrying flowers. Alongside there grew a row of Perfection (Veitch). Mr. Perry, the gardener, said that he had a constant supply of Peas from these two varieties. They were growing on land sheltered on one side by a wall, and by a hedge on another, and they were protected from the attention of the birds by means of netting. I was told that these varieties are by far the best for a late supply, and I can bear testimony of that fact in regard to Autocrat, which we had up till October 14, and the rows were unprotected. *W. A. Cook, Compton Bassett.*

THE EDINBURGH BOTANIC GARDEN.—I cannot at all agree with your correspondent, "*Vagabond*," in his eulogistic notice of the rockwork, as the flowering plants in that division of the Edinburgh Botanic garden, as seen late this autumn, I must confess to receiving a very different impression from what I saw in this garden, also in the wage of the year. The almost painful formality of the built-up stone-work seemed altogether inappropriate to the plants, that may claim, if any cultivated plants may do so, surroundings and circumstances suggesting their wild natural habitats in the mountains. To those who have not seen this rockwork, it may be described as a miniature allotment-ground, squared off by stone, or rather fragments of rock, the enclosures being about 2 feet square, and filled with soil, one series succeeding another, and the whole arrangement pierced by winding walks, which bend through and round the several elevations. The mountain climbers meeting everywhere; the same little pockets, variously filled with plants which were by no means in that floriferous state that excited the admiration of your correspondent at the time of my visit. I was the more disappointed, as I had recently visited several gardens in the far north of Scotland filled with hardy plants, gloriously in bloom, and flourishing amongst rocks, which by their natural and artistic disposal charmed the eye, as much as they were congenial to the plants. The Edinburgh Botanic Garden used to be famous for hardy plants, and especially alpine. The inner recesses of the rockwork, part of which so charmed the eye of your correspondent, could not have been explored, as the plants enumerated are by no means remarkable for interest or variety, and might be found in greater perfection in many suburban gardens about Edinburgh. Let me conclude these observations by saying that this favoured city of the North, possessing in itself so many attractive features, and surrounded by picturesque scenery, should not be behind other gardens in features representing one of its great characteristics, mountain scenery in its national botanic garden. Kew, unfavourably situated as regards soil, climate, and position, with no natural advantages or suggestions

of rocky scenery, has yet achieved a rock garden of great utility and in perfect taste, at all times a delight to the artistic eye and a source of interest to the botanist. Let me hope that the powers that preside over the destinies of its northern rival may bestir themselves and create a rock garden worthy its position; facilities exist for the conveyance of material from every part of Scotland, and I am assured there is not a proprietor in Scotland but would willingly contribute examples of rock of his estate. Trap, the foundation stone of the city, would be represented. Granite, characteristically placed, would suit many plants. The old red sandstone, still within reach, would give it distinct feature. Gneiss rock, typical of parts of the Highlands, and rocks of a calcareous character would afford a suitable resting-place for the numerous plants that belong to the mountain and other limestone. A range of rock-work thus formed would be interesting, if well planted, not only botanically, but geologically, and would more fittingly replace the present tasteless, but well-intentioned, attempt at rock building for the growth of alpine plants. *Voyager.*

DAVENHAM BANK, MALVERN.—Whilst looking through these fine gardens the other day, I observed a magnificent specimen of *Cattleya exoniensis* in full flower. It had seven flower spikes, carrying twenty-four flowers and buds, and one spike undeveloped. The richness of the colours, and the general effect, were extremely charming. A plant of *Cypripedium Sedeni* had twenty spikes, a grand plant, as was also a specimen of *Lycaste grandiflora*. *Begonia Rex*, growing underneath the centre stage in the Orchid-houses, was of marvellous luxuriance. The old-fashioned hard-wooded plants are being trained and grown into very fine specimens, and they keep improving. *Ericas*, *Epacris*, *Polygalas*, and *Witaenia corymbosa* are very fine plants. At the back of a glass case, and growing against the wall, were some Vines; amongst them was a *Gros Colmar*, carrying medium-sized bunches, very large in berry, and of a degree of finish rarely seen in this variety. Mrs. Pince, Lady Downes', and Alicante were also doing well in the same glass case. Mr. Bradshaw, besides the gardens, has under his charge a very perfect model farm. *J. Udale.*

DIOSPYROS KAKI (THE DATE PLUM).—At a recent meeting of the Birmingham Gardeners' Association, Mr. Vertegans exhibited fruit of this plant. It was introduced from China in 1789, and I remember our growing it in a then celebrated south of England nursery more than fifty years since, and it was regarded as hardy on the south coast of England and in the Channel Islands. I never knew of its producing fruit. The fruit exhibited bore a resemblance to a moderate-sized Tomato, and is of a deeper tint of colour than yellow; but the fruit was not ripe enough for getting an accurate idea of its flavour and fitness as a dessert fruit, so was not tasted. *W. D.* [Unless bleeted the fruits are generally too astringent, but one we tasted recently was almost free from it. *Ed.*]

SOCIETIES.

NOVEMBER MEETING OF THE SCOTTISH HORTICULTURAL SOCIETY.

THE meeting of this Society was held on the night of November 6, in the hall of the Y.M.C.A., Mr. Todd in the chair. A lecture on "The Dukeries and Sherwood Forest," illustrated with lime-light views, was the reason for the change of venue. Although conciseness was a necessity owing to the large number of slides, the lecturer gave a very eloquent and vivid description of all that he had seen in his pilgrimage. After a well-deserved vote of thanks, had been awarded, the minutes of the last meeting were read by Mr. A. Laird. After intimations of motions for the next meeting, Mr. Mackenzie, the Treasurer, was called upon to give a statement of receipts and payments in connection with the recent Chrysanthemum show. The most interesting details were £866 1s. 6d., the largest amount the Society have ever taken at a show of these flowers; prize-money and band, £271 15s. The Chairman then proposed that the Chrysanthemum show should be held next year on the usual scale and on the same lines. Mr. Mackenzie, in support, enlarged on the great improvement the show had wrought in perfecting in the North the cultivation of the Chrysanthemum. In ten years, he went on to say, "it had revolutionised its culture."

The motion was, of course, carried with acclamation. The same gentleman also proposed the motion for a letter of condolence to be sent to Mrs. Downie. In the course of his speech, he said that "his life-history was to improve horticulture, and that his name would also be held in loving reverence. He also mentioned the fact that Mr. Downie had risen from a gardener in a small place to be one of the foremost nurserymen of Scotland, thus showing what skill and integrity can do to raise the workman.

The finest blooms of Louis Bœhmer ever grown in Scotland were exhibited, along with some large *Souvenir de la Malmaison*. That this was really the case was admitted by all capable judges at the meeting.

ROYAL CALEDONIAN HORTICULTURAL.

THE November meeting of this Society was held in MacDowell's Rooms on November 30, Mr. Milne (James Dickson & Sons) in the chair. From the abstract of the accounts of the Society, it appears that the receipts from all sources were £1589 15s. 6d., and the payments £1488 15s. 6d., giving a balance of £100 17s. 4d., which, by deterioration of property, is reduced to £89 19s. 4d. The most interesting items were £1089 18s. 6d. for admission to the shows, the largest amount being taken at the autumn show—£472 17s.; £27 1s. 5d. was given in prizes. On the motion of Mr. Milne, Sir Charles Tennant, of The Glen, a great patron of horticulture, was elected Vice-President in the room of Sir J. Maitland-Gibson, and the following gentlemen committee-men:—Mr. D. P. Laird, Mr. M. Dunn, and Mr. McLattie. Mr. W. Young next moved that a piece of plate should be presented to the Secretary, Mr. P. Neil Fraser, for his long and disinterested services to the Society. This was cordially and unanimously agreed to; also the motion to send letters of condolence to the widows of Mr. Gordon and Mr. Downie.

NATIONAL CHRYSANTHEMUM.

DECEMBER 7.—The last meeting of the Floral Committee for the present year took place at the Royal Aquarium, Westminster, when, considering the lateness of the season and the state of the weather, a goodly number of flowers were staged. But one First-class Certificate of Merit was awarded, to Mr. Robert Owen, nurseryman, Maidenhead, for *Anemone*-flowered *Enterprise*, apparently one of the Japanese type, but singularly compact in build, the ray-florets being tubular and of a clear lilac-pink colour; the compact cushion in the centre, primrose; this is a remarkable acquisition, should this fine character be maintained. Mr. Owen also had Japanese Mrs. B. Wynne, a large broad petalled pure white Japanese, of the build of Countess of Hambleton, which deserved a higher award than Commended; Japanese Marc Micheli, pink and white, with pale yellow centre; a reflexed flower of the build of Avalanche, but not so broad in petal; W. H. Lincoln, improved, which was Certificated by the Royal Horticultural Society under the name of Thomas Selwood, but though a little deeper in colour than W. H. Lincoln, it cannot surely be distinguished from it; R. George, an incurved Japanese, yellow and salmon, greatly resembling G. C. Schwabe, and several others.

Messrs. P'tcher & Manda, Hextable, had Japanese Mrs. Lay, an incurved variety of some promise, the base lilac, large white centre—the earlier blooms come darker in tint; Miss Ada McVicker, a broad petal, white and delicate lilac-tinted variety, of the Puritan type, but more regular in shade; Japanese Pearl Beauty, like Puritan; Japanese John H. Taylor, pale magenta-rose, with primrose centre; and incurved Octa, salmon, bronze, and yellow.

From Mr. G. Evans, The Gardens, Coton Hall, Bridgenorth, came an unnamed sport from Princess Teck, between Mrs. Norman Davis and Charles Gibson in colour, and, as was well-observed by Mr. Norman Davis, "these sports want following up from stage to stage, as they will come yellow from a crown bud, and much deeper in colour from a terminal one." Mr. E. A. Wallace sent a yellow sport from Florence Percy, which has already been exhibited under the name of Mrs. N. Bromhead, and which has sported in several places. It is considered inferior to the yellow form of *Mlle. La Croix*, known as C. E. Shea.

Messrs. Henry Cannell & Sons, Swanley, had Japanese *Mlle. Marie Recoura*, a fine and striking pure white Japanese of the character of Fair Maid of Guernsey, but larger and purer in colour—it was

Commended; and Japanese Cannell's Striped, a direct importation from Japan, dark red, striped with gold, small but very distinct; it is said to be a late variety, and the first terminal bud should be taken.

CULTURAL NOTES.

WITSENIA CORYMBOSA FROM CUTTINGS.

THERE is a very prevalent idea amongst gardeners that this beautiful Cape plant is difficult to propagate from cuttings, and the old-fashioned method of increasing by rooted offsets and by seed, which is a tedious business, is still very largely adhered to, yet with proper treatment it is most easily rooted. Cuttings should be taken in July or August, only healthy clean growths being selected, taking them where possible with a slight heel; they should be inserted round the sides of thumb-pots, thoroughly drained and filled with a mixture of fine sand and peat, giving each cutting ample room. They require little or no bottom heat, but should be placed in a case in a cool-house, keeping them quite close, with the exception of airing them each morning for a couple of hours, care being taken to keep them moist and properly shaded. They generally root in ten or twelve weeks, and with careful treatment hardly a cutting will miss. *W. J. M., Glasgow.*

LOCULIA GRATISSIMA.

Many gardeners find a difficulty in propagating this plant, but if short, stocky side-growths are taken off with a heel of older wood, and inserted in cocoa-nut fibre, firmly pressed into thumb-pots, placed on brisk bottom-heat, in a shady, moist propagating-pit, moderately supplied with tepid rain-water, little difficulty will be found. I have struck them in quantity in this manner, and likewise in sandy peat and sandy loam, but have found that the cocoa-nut fibre is the best substance, not more than 1 per cent. of the cuttings failing to strike. *B. Ashton, Glosop Hall Gardens, Derbyshire.*

VARIORUM.

PRICKLY PEAR IN MEXICO.—My experience is that the plant is almost invaluable in hot, dry, and especially sandy countries, where vast stretches have to be crossed by ox-teams, and there is little or no water for man or beast. Some years ago I was well acquainted with that almost desert country lying between San Antonio, Texas, and Chihuahua, Mexico; long before the advent of railroads in that part, and when nearly all the wool grown in the northern part of Mexico found its way to San Antonio, Texas, by means of large trains of ox-waggons, and I may safely say, that had it not been for that providence of Nature, the Prickly Pear, the large traffic could not have been carried on, nor could the vast herds of sheep have been maintained in that dry arid region. It seldom rained there, and when it did the grass would spring up fresh and green, but, in a few days, the hot sun would parch it; then the winds would blow off the dried grass, leaving the ground bare again, excepting about the roots of the Prickly Pear, where it was sheltered from the hot sun, and received some moisture from the roots of the plant. It appears to me that the Cactus must derive its moisture and sustenance in a great measure from the air, as it thrives even on brick and stone walls in the driest climates, merely throwing out a few stray roots to prevent itself being detached by the winds or otherwise. It is the custom when teams of ox-waggons (commonly called the "prairie schooners") are travelling, to send men ahead in the afternoon to the place of camping for the night to prepare the supper for the oxen. Arriving at the destination, these men set to work collecting piles of dry Cactus leaves and roots with which fires are made—and here I may mention that in the absence of wood the dry plant makes excellent fuel—then

the green leaves (or flattened branches to speak strictly) are chopped off the plant, stuck on forks and toasted in the flames until all the prickles are burnt off, when the leaves are cut into convenient "chunks" for the animals to masticate. This food should be allowed to cool well before it is eaten, or it will sometimes produce indigestion and diarrhoea. Cattle work and thrive on this food alone, and can go without water for several days without any apparent shrinkage in flesh or loss of muscular force. It is very curious to see the teams of oxen brace to their work and go ahead as soon as they see or smell the fire where their supper is being prepared, and when they have finished their cooked rations and are turned loose or herded, as the case may be, for the night, they will search for the ripe fruit of the plant, which is sweet, nutritive, and juicy, and abounds in great quantities nearly all the year round. The fruit of this wild Cactus is eaten by man, but is not considered wholesome, though very refreshing, yet the fruit of the cultivated varieties is quite so. Sheep are exceedingly fond of the fruit, and when let out of the pen in the morning will race in search of the ripe fruit. Sheep will get fat in a country where there is little or nothing else but Prickly Pear; the plant needs no cooking for them, the narrowness of their mouths enabling them to gnaw at the leaves between the prickles; the leaf once opened in this manner, it is an easy matter for the sheep to get at the remainder of the pulp. Sheep require little or no moisture in a Prickly Pear country. The festive goat thrives even better than the sheep on the plant; being a climber, he gets at the fruit on the upper leaves as well as the lower. There are in this country hundreds of thousands of goats maintained in the deserts on the Prickly Pear; they are killed for the sake of their skins and tallow. When the tallow is all extracted from the meat, the residue is packed in bales, sent to the various markets, and sold to the poor for a cheap "meat food." The young "leaf-shoots" or branches of the "nopal," as it is called in Mexico, are used here for various culinary purposes; they are gathered when quite young and tender, and the excrescences from which later on the prickles would develop are shaved off with a keen knife; they are then boiled in water with a certain proportion of salt until well cooked, like any other vegetable, and are then either cut into cubes to use in soup, having the flavour of the gombo of New Orleans, or sliced into narrow strips when cold, and made into a salad in the ordinary way with pepper, salt, vinegar, oil, &c., "al gusto," most refreshing and palatable, as I can assure you personally. The sap of the leaves is used as a size to mix with lime for white-washing; the leaves are hacked with a knife, and then put into water for some time, this water being used for mixing with the lime; it is excellent for the purpose named—quite equal to the ordinary glue. I believe a vegetable glue of good colour could be made from the plant. Being a very fibrous, glutinous plant, I see no reason why it should not be a good paper-making material. Of its medicinal qualities I know little; personally I have used it occasionally as a poultice for wounds, and to relieve rheumatism. To prepare the poultice, the leaf is partially baked, or toasted in some way, if an oven is not handy, then one of the outer side-skins is taken off, and the interior pulp minced with a knife and then applied. For a wound it can be used at an agreeable temperature, but for rheumatism it must be as hot as the patient can bear it. All the above applies to the wild Prickly Pear; the cultivated species, while retaining the same properties, have additional merits, although cultivated in Mexico for the fruit alone. The following are the principal varieties cultivated, viz.:—The white Prickly Pear, the fruit of which has an agreeable acid flavour; the yellow, rather sweeter than the former; the crimson (Morada), large and small, quite sweet; the "Tapona," called so by reason of its costive effect when eaten in large quantities; the "Pelona" (naked—almost without prickles); there are two varieties of this species, producing yellow and crimson fruit respectively. Of all the Prickly Pears *this is the great*

forage plant. It is almost without the objectionable prickles, and will grow in almost any climate if not very damp; the leaves are the largest and thickest, and while the average weight of the full-grown leaves of other varieties is 3 lb., the leaves of this variety will average 8 lb. The Prickly Pear is generally reproduced by means of the leaves, and as it is necessary to dry them a little before planting, they will stand a long transportation. In some parts of the country a wine is made from the fruit; here in Tulancingo a kind of sweet is made by squeezing the inside of the fruit through a cloth to extract the juice, which is then boiled in the same manner as the juice of the sugar cane. One other species of the plant that I must mention before concluding is the "Xoconostle," the fruit of which makes a most delicious preserve. I feel sure it would "take" in England, as it has that peculiar "foreign" flavour so much liked; it has a particular flavour of its own, as distinct from other jams as Indian Chutnee from the ordinary pickle of commerce. The Prickly Pear can be easily eradicated at any time from the soil on which it grows, if it is thought better to change it for more profitable crops. *B. N. C. Fletcher, Tulancingo, State of Hidalgo, Mexico, May 12, 1892, in the Agricultural Journal of the Cape Colony, August 25, 1892.*

TRADE NOTICE.

SHIREOAKS MARKET GARDEN COMPANY (Limited), registered by Williamson, Hill, & Co., 13, Sherborne Lane, E.C., with a capital of £1000 in £10 shares. Object, to carry on business as nurserymen in all its branches. Registered without articles of association. *Financial News, December 2, 1892.*

THE CINERARIA AND CALCEOLARIA IN WINTER.

THESE are amongst the most useful of our flowering greenhouse plants; some cultivators say that they cannot grow them because of their liability to be attacked by green-fly; which they say cannot be removed by fumigating, and in time the plants succumb to the persistent attack of the parasites. It is a fact that these plants are very liable to be attacked by green-fly, which will utterly ruin them, unless the insects are destroyed, which can be done by dipping them in a solution of soft-soapy water and tobacco-liquor: but fresh broods will appear again very soon, and the dipping must be repeated. This can be continued up to the time the first flowers open. I have also used Campbell's fumigating material, and find it answers much better than tobacco smoke for killing the aphid which attacks Cinerarias; it is also much easier to deal with. The number of cubic feet of air which the house contains is ascertained, and the fumigating material required is suspended in the house, and lighted, it smoulders away gradually; the operator not needing to go into the house at all—in fact, it is rather dangerous to do so.

The potting compost we use for both kinds of plants is about four parts fibrous loam, one part leaf-mould, one part decayed manure, and one of coarse white sand. We are careful not to injure the leaves, as they are exceedingly brittle, and if injured either in the repotting or in moving them about, they get a ragged appearance, and are quite spoiled for exhibition purposes, or even for the decoration of the greenhouse or conservatory. The leaves of a plant are quite as necessary to its effect when in flower as the flowers are, and care should be taken by the cultivator to have a perfect plant. The Calceolarias flower when the Cinerarias are past their best; they also like a lower temperature, and when the plants are grown in one house, the Calceolarias should be placed at the cool end of it—they are not injured if the temperature falls to 35° or even 32°, whereas this would be very detrimental to the Cinerarias. *J. Douglas.*

THE WEATHER.

[By the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

 0, Scotland, N. Principal Wheat-producing Districts.—
 1, Scotland, E.; 2, England, N.E.; 3, England, E.;
 4, Midland Counties; 5, England, S.
 Principal Grazing, &c., Districts.—6, Scotland, W.; 7,
 England, N.W.; 8, England, S.W.; 9, Ireland, N.
 10, Ireland, S.; (* Channel Islands.)

THE PAST WEEK.

The following summary record of the weather for the week ending December 3, is furnished from the Meteorological Office:—

"The weather was wild and changeable during the earlier part of the period, with occasional rain in all parts of the kingdom; but, later on it became much colder, with showers of sleet or snow over the northern and north-western districts, and some considerable falls of rain in the south.

"The temperature after being high very generally, fell rapidly towards the end of the week, and in the northern districts it became very low. The highest of the maxima were recorded on November 28, and ranged from 61° in 'Scotland, W.,' and 60° in 'Scotland, E.,' to 52° in 'England, E.' The lowest of the minima were registered on December 1, when they varied from 13° in 'Scotland, N. and E.,' and from 19° in 'Scotland, W.,' to 29° in 'England, S.,' and to 38° in the 'Channel Islands.'

"The rainfall was greatly in excess of the mean in 'Scotland,' and rather so in 'England, S.,' and many of the western districts. Over the eastern parts of Great Britain, and in 'Ireland, N.,' however, there was a deficit.

"The bright sunshine was more prevalent than for some weeks past, and exceeded the mean in most parts of England and in the east of Scotland. The percentage of the possible duration ranged from 32 in 'England, N.E.,' 27 in 'England, S.,' and 26 in 'Scotland, E.,' to 12 or 13 in Ireland, and to 10 in 'Scotland, N.'"

MARKETS.

COVENT GARDEN, December 8.

MARKET very dull with good supplies, and prices unaltered. James Webber, Wholesale Apple Market.

POTATOS.

SPITALFIELDS: Dec. 6.—Quotations:—Magnums, 50s. to 65s.; Imperators, 60s. to 70s.; Champions, 45s. to 60s.; Regents, 50s. to 57s. per ton; German Magnums, 2s. 6d. to 3s. per bag.

BOROUGH: Dec. 6.—Quotations:—English Magnums, 55s. to 65s.; Snowdrops, 60s. to 70s.; Hebrons, 60s. to 65s. per ton.

FARRINGTON, Dec. 8.—Quotations:—Imperators, 60s. to 70s.; Bedford Magnums, 60s. to 70s.; Fruce, do., 80s. to 90s.; Schoolmaster, 80s. to 85s. per ton.

GENERAL AVERAGES: Dec. 7.—Magnums, 55s. to 75s.; Hebrons, 60s. to 80s.; Snowdrops, 60s. to 80s.; Imperators, 50s. to 70s.; Champions, 45s. to 60s. per ton.

CORN.

Averages.—Official statement of the average prices of British corn, imperial measure (quarter) for the week ending December 3, and for the corresponding period last year:—1892: Wheat, 27s.; Barley, 25s. 5d.; Oats, 17s. 2d. 1891: Wheat, 38s. 11d.; Barley, 30s. 9d.; Oats, 22s. 4d.

HAY.

Averages.—The following are the averages of the prices at the principal metropolitan markets during the past week:—Clover, prime, 80s. to 115s.; do., inferior, 50s. to 75s.; hay, best, 75s. to 112s.; do., inferior, 45s. to 65s.; and straw, 28s. to 41s. per load.

NOTICES TO CORRESPONDENTS.

* PHOTOGRAPHS, DRAWINGS, OR SPECIMENS.—We shall be pleased to receive from our Correspondents notes relating to interesting Gardens, together with Specimens or Illustrations of interesting Plants. Although circumstances prevent us in all cases from reproducing them, we are nevertheless glad to receive them, and as far as possible to utilize them for the benefit of readers.

BATH SHOW: P. M. We cannot at this remote date insert anything about your exhibit at this show.

BOOKS: G. Abbey. Apply to Lovell, Reeve & Co., Booksellers, Henrietta Street, Covent Garden, W.C. The author named published nothing in book form on Lichens.

GLASS HOUSES: Young Gardener. The houses might be planted near the glass with Tea Roses, say Maréchal Niel, Niphetos, and A. K. Richardson, and further away from it the best kinds of Peaches and Nectarines might be planted. The Roses being pruned hard back in May after flowering, would not grow so much during the summer as to injure the Peach trees, or the fruits. The finest blooms and fruits should be aimed at. Under the Peach trees, Maidenhair Ferns and Davallias might be grown, either for sale as cut fronds or in pots. You might cultivate Freesia refracta, Dutch bulbs, Amaryllis, Violets, planted out or in pots; Selaginellas, Tradescantia zebrina, &c. Lily of the Valley might be forced in a cheap kind of hot-water pit, and brought into the house in bloom. Lygodium scandens might be grown for cutting; it would cover the ends of the houses, or run up the roof supports. Salads might be grown in the winter. Places might be found for forcing Rhubarb, Seakale, Endive, and Chicory, and perhaps for growing Mushrooms under protection, or on ridges out-of-doors. Helleborus niger blooms pay well if brought on under glass. Elaine and Avalanche, and the choicest colours in Japanese Chrysanthemums, fetch good prices if grown in quantity, so that dealers could be sure of getting blooms during the season. Put an under-crop under the orchard trees, if these are not too close for that.

GOOSEBERRIES AND CURRANTS, &c.: Constant Reader. The young wood is that which must be cut out, that is generally speaking, which should be done to within 1/2 inch of the shoot or branch from which it springs. Main and secondary branches should not have their terminal shoot shortened, unless it is likely to touch the ground during its growth next summer. These main branches may have one young shoot left on each about the middle of their length, also not to be shortened back. Do not let young shoots or branches cross each other. Keep the middle of the bush clear of all shoots. Always cut to a bud which will push a shoot in the desired direction. The above applies to both kinds of fruit, except that red Currants should have the shoots that are retained cut to various lengths, say, from 6 inches to 15 inches according to position. Black Currants need to have the weaker shoots

SEEDS.

LONDON: Dec. 7.—Messrs. John Shaw & Sons, Seed Merchants, of Great Malze Pond, Borough, London, S.E., write that, owing to the large number of farmers and others up in London for the Cattle Show and the Agricultural Conference, the seed market this week has been well attended, without however, much activity in actual business. As regards red Cloverseed, some fine new English has just realised 112s. per cwt.; this makes choice bold purple American at 85s. excellent value. Trefoil has lately met with more attention. There is no change in either Alske or White. Canary seed is held for advanced rates; the Turkish crop this year is estimated at 15,000 bags against 60,000 for 1891, and 100,000 for 1890. Hempseed keeps steady. For Peas and Haricots the demand is slow. Some fine new Champion Scarlet Runner Beans are now obtainable at tempting figures. Rapeseed tends to harden in value. Mustard, both white and brown, is much wanted.

FRUITS AND VEGETABLES.

SPITALFIELDS: Dec. 6.—Quotations:—American Apples, 10s. to 16s. per barrel; English do., 2s. 6d. to 8s. per bushel; Pears, 2s. 6d. per half-sieve; English Tomatos, 2s. 6d. to 5s. per peck; foreign do., 1s. to 1s. 6d. per box; Cabbage, 2s. to 3s.; Savoys, 3s. to 4s. 6d.; Cauliflowers, 4s. to 6s. per tally; Greens, 2s. to 2s. 6d.; Turnips, 1s. 6d. to 2s.; Carrots, 2s. to 3s.; Parsley, 1s. to 2s. per dozen bunches; Spinach, 1s. to 1s. 3d. per bushel; Brussels Sprouts, 1s. to 1s. 3d. per half-sieve; Turnip-tops, 2s. 3d. per bag; Horseradish, 1s. 6d. to 1s. 9d.; Celery, 9d. to 1s. per bundle; frame Cucumbers, 3s. to 6s.; Beetroots, 1s. to 1s. 6d.; Leeks, 1s. to 2s.; Cabbage Lettuces, 6d. to 8d.; Endive, 6d. to 9d. per dozen; Cos Lettuces, 6d. to 1s.; Parsnips, 4d. to 8d. per score; Mustard and Cress, 2s. per dozen baskets; English Onions, 5s. to 6s. per cwt.; Spanish do., 5s. to 6s.; Bordeaux do., 3s. to 4s. per case; Dutch and Belgian do., 4s. to 5s. per bag of 110 lb.; Carrots, 50s. to 60s. per ton.

BOROUGH: Dec. 6.—Quotations:—Cabbages, 2s. to 2s. 6d. per tally; Cauliflowers, 9d. to 1s. 3d. per dozen; Spinach, 1s. to 1s. 6d. per bushel; Brussels Sprouts, 1s. to 1s. 3d. per half-sieve; Carrots, 2s. 6d.; Turnips, 1s. 6d.; Parsley, 1s. 6d. per dozen bunches; English Onions, 6s. to 6s. 6d.; Dutch do., 4s. 6d. per cwt.; Horseradish, 1s. 6d. per bundle; English Apples, 2s. 6d. to 10s. per bushel.

FARRINGTON: Dec. 8.—Quotations:—Parsnips, 3s. per cwt., 60s. per ton; Carrots (Bedford), 50s. to 60s. per ton; Celery, 8s. per dozen; English bag Onions, 6s. to 7s. per cwt.; Spanish do., 5s. to 6s. per case; Turnips, 2s. to 2s. 3d. do.; American Apples, 14s. to 16s. per barrel; Sourings, 4s. per bushel; Blenheims, 6s.; and Wellingtons, 6s. do.; Tomatos (Canary), 8s. per large box.

removed quite down to the ground, if these spring from the roots, and some of those that spring from the main branches. This must be done to prevent undue crowding of the shoots, resulting in small berries. Old branches getting fruitless must be cut out at the ground-level. No young shoots left need to be shortened in bushes already formed and in bearing, only in bushes in course of formation. Raspberries should have weak canes and those that have fruited cut away; eight or ten canes to a stool are enough.

INSECTS EATING FERNS: *J. Adams.* What you call "Botts," are probably a species of weevil. Hunt for them at night with the aid of a slide lantern, when by turning the light on the plants suddenly, the depredators may be detected dropping to the ground. They are lively fellows, and must be caught at once when observed. The grubs may have come in with the potting soil. Having caught a few, send them to us for identification.

NAMES OF FRUITS: *Harry.* Scarlet Pearmain.—*J. J. & Sons.* 1, Not recognised; 2, King of the Pippins; 3, Royal Somerset; 4, Golden Reinette; 5, Dutch Codlin; 6, Beauty of Kent; 7, not received; 8, Scorpion; 9, Beurré Diel, much decayed.—*F. F.* 1, Blenheim Orange.

NAMES OF PLANTS: *G. O. W.* Phlox subulata, probably. — *Chepstow.* Cymbidium giganteum. The spots on the Dendrobium leaf are probably caused by the plant being kept in too high a temperature after the growths are finished.—*Grower.* Miltonia Bluntii.—*S. J.* 1 and 2, we cannot undertake to name florists' flowers: send them to a specialist; 3, Libonia florabunda; 4, Rondeletia speciosa; 5, Sanseveira variegata; 6, Gynostachya Pearcei.

PALEMS: *F. L.* The leaves sent show the ravages of all kinds of insects to be found in a hothouse. You must pay more attention to keeping the plants clean by using insecticides, the syringe, and the brush and sponge. All Palms need to be cleaned in every part which can be cleaned, twice a year at the least.

QUICK-GROWING TREES: *Vindex.* Acer negundo, A. platanoides, Gleditschia triacanthos, Weeping Willow, Castanea vesca, C. lutea, Pavia in variety, Tulip tree, Juglans nigra, J. regia laciniata, Bigonia speciosa, Esculus hippocastanum, Alder in variety, Sophora japonica, Corylus avellana, Platanus orientalis, &c.

RED-BERRIED PLANTS FOR A WALL: *Vindex.* Crataegus pyracantha, Cotoneaster Simonsii, C. microphylla, Rosa rugosa, R. mollis, R. m. pomifera, R. canina, R. sempervirens scandens, R. rubiginosa (Sweet Briar), Lonicera Periclymenum (Woodbine), Rubus phoenicolasius, R. lasiocarpus, Berberis vulgaris (Common Barberry), Enonymus europæus.

ROMAN HYACINTHS: *J. H. S.* We have received several complaints. The bulbs look healthy, but they may not have been properly ripened last year. We do not think either the grower or seller is to blame, but the clerk of the weather.

SAWDUST AS MANURE: *F. A. H.* Not only useless, but dangerous, as when dug into the soil, it forms a very suitable medium for the growth of fungus. Burn it, and spread the ashes on the land.

SWEDEN, TURNIPS, AND CABBAGES: *Seedsman.* As these flower at about the same time, certainly there is great danger of cross-fertilisation if grown side by side. The fields ought to be some few miles apart.

TOMATO-FLY AND MEALY BUG: *Constant Reader.* It is not consonant with fact or reason that the one insect breeds or introduces the other on the plants; but it is a fact that they multiply fast side by side if means be not taken to destroy them by fumigation in the one case, and washing with insecticides in the other.

TREES TO HIDE A FENCE: *Vindex.* Red Cedar, Cupressus Lawsoniana, Thuja sibirica, Thuja orientalis, Rhododendron ponticum, Buxus, Caucasian Laurel, Raphiolepis ovata, Yews in variety.

THOMAS GREEN & SON, LTD.,

LEEDS and LONDON,

HORTICULTURAL ENGINEERS to HER MAJESTY THE QUEEN, call Special Attention to their Patent Wrought-Iron Municipal or Angular Chambered and Tubular

HOT-WATER BOILERS,

And others with SHELVES, and HOLLOW or ORDINARY CAST-IRON GRATE BARS.

SADDLE BOILERS, With WATERWAY BACKS and WELDED BOILERS, any of which are specially adapted for Heating Greenhouses, Conservatories, Churches, Chapels, Schools, Public Buildings, Entrance Halls, Warehouses, Workshops, &c. They are the neatest, cheapest, most effective, and durable of any extant.

The MUNICIPAL and TUBULAR ones are remarkable for their great heating power, slow combustion, and the length of time the fire will burn without requiring attention.

These Patterns secured the FIRST and HIGHEST PRIZE—a SILVER MEDAL—at the Royal Horticultural Society's Exhibition, South Kensington, London, June 1, 1881.

MUNICIPAL PATTERN BOILER, THE BEST EXTANT.

— FRONT ELEVATION — — LONGITUDINAL SECTION — — SECTIONAL PLAN —

The longitudinal section gives a view of the fire-box, water space, flues, &c. The cross section gives a view of the fire-box, water space and V-shaped back. The front elevation shows it set in brickwork, which is necessary for this class of boiler.

TESTIMONIALS.

Re HEATING APPARATUS. Borough Engineer's Office, Municipal Buildings, Leeds, January 9, 1886.
MESSERS. THOS. GREEN AND SON, LTD., NORTH STREET, LEEDS.
 GENTLEMEN,—I have great pleasure in bearing testimony to the efficiency and satisfactory working of the Hot-water Heating Apparatus you erected in these public buildings.
 The buildings are four storeys high, and we have a total length of about 28,000 feet of piping in them, varying in size from 1½ in. to 6 in. diameter, with their connections, &c. The several offices and rooms can all be in operation at one time or separately, and the heat regulated by means of the valves to the temperature required, even in the coldest weather.
 Two of your Patent Municipal Pattern Boilers, No. 4, work the whole of this piping easily, although we have three of them fixed. They are very powerful and economical in the consumption of fuel, and I am pleased to be able to report of them and the apparatus so favourably.
 I am, Gentlemen, yours truly, THOS. HEWSON, Borough Engineer.

Morley House, Bagot, St. Saviour's, Jersey, November 10th, 1886.
GENTLEMEN,—The large Municipal Boiler which you sent me last year is doing its work satisfactorily; it is heating 5000 feet of 4-inch pipe in one of my vineries, and I am quite sure that it has power to work a much greater length, while in cost of fuel it compares favourably with my other Boilers.
 I have now five of your Boilers in use, and I cannot speak too well of their heating powers, or their comparatively small consumption of fuel.
MESSERS. THOS. GREEN AND SON, LTD., LEEDS.
 Yours faithfully, (Signed) G. W. BASHFORD.

And HUNDREDS OF OTHER REFERENCES CAN BE GIVEN IF REQUIRED.

OFFICES:—72, HIGH STREET, WORCESTER.

DR. SMILES' WORKS.

JASMIN: BARBER, POET, PHILANTHROPIST. Post 8vo. 6s. Fourth Thousand.

"What Jasmin did for himself in poetry Dr. Smiles has now done for him in prose, doing full justice to that part of his life which Jasmin's simple modesty forbade him to record, namely, his unceasing philanthropic efforts. The story is noble as well as touching, and is told by Dr. Smiles with abundance of sympathy and appreciation."—The Times.

"Dr. Smiles has performed a praiseworthy task in introducing this little-known but admirable man to English readers. . . . He died worn out at the age of sixty-five. In the south of France he was mourned as the friend of the friendless, as the St. Vincent de Paul of poetry."—Academy.

"Dr. Samuel Smiles has given to the world a graceful and sympathetic record of a pure and beautiful human life, teeming with the poetry of action as well as of thought, and redolent throughout of good deeds and loving kindness."—Daily Telegraph.

"Il a fait un livre bien personnel et aussi complet que possible. Voilà Jasmin 'raconté' en anglais pour la postérité. C'est M. Smiles qui est le coupable, et son élégant volume nous a tout à fait charmé."—Revue Littéraire.

"No one of Dr. Smiles's books is more delightful than this one about the warm-hearted poet of Gascony. Dr. Smiles appears here at his best; for the story of Jasmin's life is full of romance, and the style of this volume has the happy characteristics of ease, simplicity, and beauty."—Liverpool Mercury.

"The story of such a life is well worth telling, and it has been admirably and sympathetically told by Dr. Smiles in a book which, to our mind, is one of the most attractive of all his works."—John Bull.

"One of the most touching and charming biographies we have ever read."—Critic (New York).

TO FLORISTS. —A young Lady desires re-engagement. Eleven years' experience; well up in all branches. First-class references.—**FLORIST, 14, Clarendon Road, West Green, Tottenham, N.**

HOLLOWAY'S PILLS. —The sudden changes, frequent fogs, and pervading dampness sorely impede the vital functions and conduce to ill-health. The remedy for these diseases lies in some purifying medicine, like these PILLS, which is competent to grapple with the mischief at its source, and stamp it out without fretting the nerves or weakening the system. Holloway's Pills extract from the blood all noxious matters, regulate the action of every disordered organ, stimulate the liver and kidneys, and relax the bowels. In curing chest complaints, these Pills are remarkably effective, especially when aided by friction of the Ointment on its walls. This double treatment will ensure a certain, steady, and beneficent progress, and sound health will soon be re-established.

AWARDED TWENTY PRIZE MEDALS

AT INTERNATIONAL EXHIBITIONS AT HOME AND ABROAD.

KEITH'S PATENT BOILERS, THE "CHALLENGE," "VIADUCT," "PYTHON," &c.,

FOR HOT-WATER HEATING, "STAND FIRST," require no building work round them, are entirely water-jacketed, and heat from 50 feet up to 20,000 feet of 4-inch pipe respectively. Many thousands are in use all over the world, and the Boilers are unrivalled in power and economy.

KEITH'S "PYTHON" BOILER, as illustrated below, has 1000 square feet of effective heating surface, with 17½ square feet of fire-grate area: heats about 20,000 feet of 4-inch pipe, and is the Most Powerful and Complete Sectional "Special" Hot-water Heating Boiler in the World.

This Engraving "illustrates the most powerful form of Boiler that has yet been made for Hot-water Circulation."—Extract from Hood, on *Warming by Hot-water*, New Edition, 1891.

KEITH'S BOILERS

are almost exclusively used by Her Majesty's Government, at the Home Office, and for the Heating Work of the Prisons throughout the United Kingdom, in preference to all others.

Manufactured under thirty James Keith's Patents in Great Britain, United States, and Canada.

JAMES KEITH (C.E., Assoc. M.Inst.C.E.), Gas, Hydraulic, Heating, Ventilating, and Consulting Engineer. Established 1823. Contractor to Her Majesty's Government. 57, HOLBORN VIADUCT, LONDON, E.C., ALSO AT EDINBURGH AND ARBROATH.

KEITH'S PATENT RAMS & Self-acting,

HYDRAULIC RAM-PUMPS, For Raising Water.

The very HIGHEST EFFICIENCY attained in Self-acting Hydraulics, by KEITH'S RAMS.

KEITH'S PATENT "UNIVERSAL" RADIATORS, For Hot-Water Heating. Made in One Piece, and in many Sizes and Modifications. No Joints to Leak. Thousands in use.

FIXED.

Full Particulars on application. Testimonials:—

From Mr. J. WILLARD, Head Gardener to the BARONESS BURDETT-COUTTS, Holly Lodge Gardens, Highgate, N., July 12, 1892.—"Dear Sirs, Having given your Improved Garden Gully a fair trial, I may say that it proves in use all that you claim for it, and in my opinion has, for the sides of walks and drives, many advantages over the ordinary grating. Perhaps the best proof I can give you of this is that, as opportunity offers, I intend to use them instead of gratings. Faithfully yours, J. WILLARD."—To Messrs. VINCE & VINE.

From W. WALTON, Esq., Secretary to the LONDON CEMETERY COMPANY. The London Cemetery Company, 29, New Bridge Street, Blackfriars, E.C., July 25, 1892.—"To Messrs. VINCE & VINE, Highgate. I am very happy to testify that your Patent Garden Gully-Frames in lieu of the old-fashioned gratings answer admirably. They were by my authority fixed in a new pathway made in Highgate Cemetery, and in the recent thunder showers they were severely tested and were

VINCE & VINE, 58, Chester Road, Upper Holloway, London, N.

THE IMPROVED GARDEN GULLY (VINCE'S PATENT).

This useful invention is a great improvement on the ordinary Garden Grating, and is especially suitable for hilly walks and drives. As they never get stopped by rubbish or sand they effectually prevent the washing away of the gravel in heavy storms, and they save half the labour in cleaning out the cesspools. The prices are:—

6-in., 1s. 6d.; 8-in., 2s.; 10-in., 3s.; 12-in., 6s. 6d. 15-in., 8s. (The larger sizes are very strong for carriage drives.)

most effectual in preventing the scouring of the gravel. At the inspection my Directors were much pleased with them, and gave instructions that they were to be used when required at Nunhead Cemetery.—I am, yours truly, W. WALTON, Secretary."

From Messrs. CUTBUSH AND SON, Highgate and Barnet Nurseries.—"Highgate Nurseries, London, July 27, 1892.—Dear Sirs,—Referring to the Improved Garden Gully you fixed for us some months ago, we are glad to say it answers admirably. As you are aware, our Nurseries here are very hilly, and during the recent storms all the ordinary gullies were blocked, whereas yours was in good working order. We shall not hesitate to recommend the same to anyone requiring the gullies for sides of paths and carriage-drives, and we feel certain, when it is known, there will be a great demand.—We are, yours faithfully, WM. CUTBUSH AND SON.—Messrs. VINCE & VINE."

HORTICULTURAL BUILDER.

Every description of GREENHOUSES, LIGHTS, &c.

PIT LIGHTS.

Best quality and workmanship, 2 inches thick, 6 ft. by 4 ft., iron bar across and very strong, 4s. 6d. each, 50s. doz., £10 for 50 lights, free on rail in London. Cash or reference with order.

CUCUMBER HOUSES.

Timber sufficient to build 100 feet by 12 feet house, lights, door, &c. Put on rail in London. Price, £9 10s. Send for detailed specification, to

Friday Next.

MESSRS. PROTHEROE AND MORRIS have received instructions from F. Sander, St. Albans, to SELL by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, E.C., on FRIDAY NEXT, Dec. 23, at half-past 12 o'Clock, superb importations of a probably new type of DENDROBIUM NOBILE,

FROM THE CHINA ASSAM FRONTIER.

Most distinct-looking and fine plants. Among them a good many splendid masses.

Collected on the slopes of the LANGTANG MOUNTAINS, whose heights are covered with perpetual snow.

Also from the same and hitherto untapped source, a fine lot of VANDA CERULEA, with exceedingly large richly-hued blossoms, and found growing on sparsely clothed, knarled, and Dwarfish Trees, and at an unusual elevation.

Here, too, our Collector discovered a variety of CYPRIPIEDIUM INSIGNE, Probably quite a new type.

The geographical range of the above three splendid and popular plants is truly amazing, the district now covered being a new surprise, and quite new to all.

We shall also offer quite a fine lot of the rare and lovely L. ELIA ELEGANS;

The extraordinary and beautiful Octopus Orchid, BRASSIA SUPERBISSIMA,

Whose petals frequently stretch to 2 feet across, ONCIDIUM AMPLIUM MAJUS, CATTLEYA SPECIES, CYPRIPIEDIUM LAWRENCEANUM, &c. On view morning of Sale, and Catalogues had.

Thursday Next.

300 AZALEA INDICA, including some very fine plants; 100 A. MOLLIS, 54 RHODODENDRONS from Belgium, 40 lots of FERNS from an English Nursery, LILY OF THE VALLEY, Berlin Crowns, Hardy Border BULBS and PLANTS in variety, and about 300 lots of DUTCH BULBS.

MESSRS. PROTHEROE AND MORRIS will SELL the above by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on THURSDAY NEXT, December 22, at 12 o'Clock. On view morning of Sale, and Catalogues had.

Monday, Wednesday, and Thursday Next.

1000 lots of First-class DUTCH BULBS, comprising choice Hyacinths, Tulips, Crocuses, Narcissus, Iris, Scillas, from reliable growers; Pionies, Gloxinias, Begonias, Anemone Fulgens; 1000 Liliam Harrisii, L. candidum, Japanese Liliums, &c.

MR. J. C. STEVENS will SELL the above by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on MONDAY, WEDNESDAY, and THURSDAY NEXT, December 19, 21, and 22, at half-past 12 o'Clock precisely. On view mornings of Sale, and Catalogues had.

Wednesday Next.

Pyramid and Dwarf-trained FRUIT TREES, 200 Dwarf ROSES, Hardy ORNAMENTAL SHRUBS and PLANTS, also 800 Clumps of CYPRIPIEDIUM SPECTABILE, and 500 C. ACACULE from America, 50,000 Best Berlin LILY OF THE VALLEY Crowns, 2000 Clumps of same, 2000 SPIREA JAPONICA, &c.

MR. J. C. STEVENS will include the above in his SALE by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on WEDNESDAY NEXT, December 21. On view morning of Sale, and Catalogues had.

Thursday Next.

An Importation of LILIUMS from Japan, comprising 1000 extra grand bulbs of L. auratum, 2000 smaller ditto, L. Krameri, L. longidorum eximium, L. speciosum album, and L. s. rubrum in splendid condition.

MR. J. C. STEVENS will include the above in his SALE by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, on THURSDAY NEXT, December 22. On view morning of Sale, and Catalogues had.

STREPTOCARPUS, NEW HYBRIDS. VEITCH'S STRAIN.

AWARD OF MERIT, Royal Horticultural Exhibition, May 29, 1891.

FOUR CERTIFICATES OF MERIT, Royal Botanic Society's Exhibition, April 22, 1891.

JAMES VEITCH & SONS

Beg to Offer Seed of their Superb Strain of this most desirable Greenhouse Plant.

From the numerous complimentary letters which reach us respecting the very satisfactory results obtained from the seed distributed last season, and the favourable comments of the Horticultural Press, we feel sure that these hybrids have a splendid future. The results of last year's work upon these has been to give us larger and more expanded flowers, and a considerably increased proportion of the rarer and the brighter colours, particularly among the rose, rosy-purple, reddish, and magenta shades; and from the seed now offered, which has been further hybridised, many entirely new and striking varieties may be confidently expected.

If seed is sown the end of January and February, the plants come into bloom the following June and July, and continue flowering freely until the end of September and October. **PER PACKET, 2s. 6d.** Price to the Trade on application.

For full descriptions of the above and other Choice Novelties and Specialties, see *SEED CATALOGUE* for 1893, forwarded Gratis and Post-free on application.

ANTHONY WATERER,
KNAP HILL NURSERY, WOKING, SURREY.

VICTOR POTATOS
(SHARPE'S).

This favourite first early Potato, suitable for any Garden, indispensable for Forcing and Early Borders, and likely to take the first rank amongst first earlies for market use. Quality and yield all that could be desired. One well-known market grower has this year had a yield of 15 tons per acre on a large acreage. London and Manchester salesmen speak highly of their quality, and report that Victors will keep their bloom and have a fresh appearance after being in the market some days, when other early Potatoes have become discoloured and unsaleable.

The stock we offer is the true yellow-fleshed variety and not the white variety, which is often substituted.

Price per cwt. and ton. State requirements to

THE

Gardeners' Chronicle.

SATURDAY, DECEMBER 17, 1892.

THE FRUIT GARDENS,
BARHAM COURT.

THESE are situated in the valley of the Medway, about four miles from Maidstone and one mile from Watlingbury station, and have for many years been celebrated for the fine fruit they have produced. This must be very gratifying to the owner, Roger Leigh, Esq., who has spent a large sum of money in making these gardens, and furnishing them with the best kinds of fruit trees. Much of the planting was done under the superintendence of the late Mr. Haycock in 1872 and the following years; but some of the trees at present in bearing were planted previous to that date, and were fruiting even then, at which time and for several years after they were trained in a variety of French styles, some as oblique cordons, some as horizontal cordons, and many in other forms, affording splendid fruits at that time. Unfortunately, the progress of events has not been altogether favourable to these gardens, and a much larger crop is now required, but fewer men are employed. Mr. Woodward has, therefore, been compelled to allow the trees to grow more naturally; some of the low horizontal cordons have developed into espaliers, some of the espaliers trained on wires, have gone far above the supports, and developed small heads; but notwithstanding this, the fruit leaves nothing to be desired, either in size or colour, although some of the trees at the time of my visit in the early autumn of the current year, were carrying a heavy crop. I noticed especially a cordon Alexander Apple which had grown up in this manner, and the crop that it bore was remarkable for the variety, even in fruitful Kent. Trees of Doyenne Boussoch and Pitmaston Duchess Pears were also fruiting in the same manner, but the majority of the Pears are in an unsuitable soil, chiefly owing to the bottom spit having been brought to the top when the trenching was done, now, many years ago; whilst those which Mr. Woodward has planted since that time without trenching the ground are doing well. These are chiefly the oblique cordons on the walls, which are, with one or two exceptions, worked on the Quince stock, and plenty of stones are laid on the surface which keep the soil moist and cool, the situation being rather too dry for the Pear; and although the fruit—especially on the wall—cordons was very fine, it was evidently an arduous task to grow the fruits to a large size.

One fruit of Pitmaston Duchess, weighed in my presence, brought down the scale at 1 lb. 11½ oz., it had been gathered several days, and I have no doubt weighed fully 1½ lb. when first taken off

the tree, as I find these large fruits lose weight considerably while ripening. Williams' Bon Chrétien was past its best at the time of my visit, but several fruits remained that were as large as Pitmaston Duchess in many places. Doyenné du Comice was carrying a fine crop. Mr. Woodward considers this the best of all Pears. Doyenné Boussoch was remarkable for its fine colour and size. Beurré Hardy had given some fine fruit, but the variety is as shy a bearer here as in some other places. Triomphe de Vienne had some very large fruit nearly ripe, and was very fine looking. Beurré d'Amanlis was both large and of good flavour, a very useful Pear, as it generally bears well. Other good varieties were Princess, Louise Bonne of Jersey, and Marie Louise; the latter being one of the best flavoured, but cannot be got to grow as large as many of the above-named varieties. Many trees of Bergamotte d'Espereu had been cut back and grafted with Pitmaston Duchess, and these bore very large fruits; and as showing the influence the scion has on the stock, or possibly the effects of the wounds caused by grafting, the stock was in some instances carrying fruit below the union which were much larger and better than ever they were before. On some of the scions, too, the fruits were almost ripe, while others on the same tree, against a west wall, had fruits which were hard and green—a condition due probably to the flow of sap being more copious at some of the unions than in others. The Japan Pear had proved to be of poor quality, and had been cut back and grafted with one of the above varieties.

The Apples, however, are the chief feature at Barham, and at the time of my visit, some of the finest fruit of one variety, viz., Peasgood's Nonsuch, had decayed. Mr. Woodward considered this due to the insect agency, as it is an Apple with very tender flesh, and soon rots if injured. Some fruits of Golden Noble, which is one of our best varieties, weighed about 1 lb., but is not generally seen of a very large size. A good many trees of Alexander are grown, a variety that is a favourite here, and no wonder either, seeing what splendid fruit it produces. Wadhurst Pippin is not so widely known as some others that I have mentioned. Some trees of this variety were carrying very large fruit; it looks likely to prove a better keeper than some other Apples of large size. Golden Spire here crops well every season on bushes, and is a very useful Apple, fetching a good price in the market. Queen Caroline is a pretty, clear yellow-skinned fruit, and a good bearer, and good as a culinary fruit. Washington was carrying some enormous fruit on bushes, and it was of an unusually high colour, reminding me of fruit grown in an orchard-house. Mère de Ménage was not carrying a heavy crop, but the fruits were very fine; this variety does not do well in some places, being probably of tenderer constitution. Cox's Pomona, on an espalier, was carrying a heavy crop of fruit of a splendid colour. It faced the west; it is a trustworthy bearer, of fair size, and it looks just the fruit for market. Lane's Prince Albert seems to do well everywhere, and it was fruiting heavily on young standards. Loddington, or Stone's, is a variety that does not succeed with everybody, but nothing could do better than it does here, and a large number of trees are grown, all being heavily laden. Mr. Woodward attributes his success with this variety to his planting it in very firm soil, manure being applied when necessary, by opening a trench near the ends of the roots, and burying it there. I saw some fine large trees

of Loddington in another Kent orchard, which were carrying a very heavy crop. They had been cut-back and grafted about thirty years ago, and they very seldom miss bearing; it is a much better keeper than Ecklinville, and resembles it for size and cooking qualities. Worcester Pearmain was nearly out of season, a few very large fruit of it remained which were perfect in colour. Lord Derby was still very green, but it promised to give some grand fruit; the same may be said of Belle Dubois, Annie Elizabeth, and Waltham Abbey. The fruit of New Hawthornden had been gathered, and some of the fruit seen in the fruit-room were very large. Cox's Orange Pippin was so large and highly coloured as to be scarcely recognisable at the first glance. Ecklinville Seedling and Grenadier are grown in quantity, but the bulk had been sent to market before I came—a few enormous specimens were still to be seen. The foregoing list contains the names of the finest Apples and Pears in this collection at the time of my visit—about one hundred kinds are grown altogether.

The whole secret of the growth of this splendid fruit consists in a free healthy growth of the trees, well thinned out, therefore well ripened; judicious feeding with farmyard and chemical manures when the crop of fruit or the state of growth requires it, firm soil without deep digging, manure being put in trenches near the roots when required. The soil is stirred and kept clean among the trees during summer by hoeing, but no weeds are taken away; they are drawn together in the centre of the rows in the autumn, allowed to decay, and then spread again—there is no waste of fertility by this system. The Apples are planted a good distance apart, and the under bushes consist principally of Currants. The soil is a good loam resting on limestone, with a gentle slope to the south, and the climate is favourable for developing colour and good flavour. The neighbourhood generally is less than 100 feet above sea-level, and I must not omit to add, the crop is thinned carefully when extra large specimens are desired.

Some very fine Peaches were noticed on the south and west walls; Lord Palmerston had a heavy crop of fine fruit, and was good in colour. Sea Eagle was very large, growing on a south wall under a wide glass coping. Mr. Woodward speaks very highly of this variety, and it evidently deserves all that he said in its favour. The Nectarine Peach on a west aspect was carrying a heavy crop, remarkably good in colour. Princess of Wales also had some very fine fruit. The indoor Peaches had been finished for some time. Standard trees are grown in a large span-roofed house planted down the centre, and are preferred to trellis trees on account of the heavy crop they bear, and the small amount of labour required for pruning and training.

In the other house I noticed a fine crop of Tomatos of a very large variety not yet in commerce, but well worth growing for its good colour and heavy cropping qualities. These are grown in succession to the forced Strawberries, of which some 2000 plants were being prepared for next spring, and looked very healthy and strong. In another house was a large batch of *Cypripedium insigne*, which will give a fine lot of flowers by-and-by, and outside was a nice lot of Mrs. Sinkins Pink in pots. This is grown for early forcing here, and proves very useful. Some nice plants for decorative purposes are grown in quantity, but the principal plant houses and the flower gardens are now under separate management, and time was too short for me to see them, and I had to hurry away with many thanks to Mr. Woodward for his courtesy and

kindness, and much regret at leaving such a splendid collection of fruit. *W. H. Divers, Ketton Hall Gardens, Stamford.*

NEW OR NOTEWORTHY PLANTS.

DISA STAIRSII, n. sp.*

THIS plant was collected by W. Grant Stairs, Esq., on Mr. Stanley's last great expedition in 1889. As we can only judge from descriptions, this new *Disa* must be placed near *Disa hircicornis*, Rehb. f., and *Disa Walleri*, Rehb. f., both of East African origin, and belongs to that group of species of which *Disa polygonoidea* is the best-known representative. I refrain from repeating all the characters given in the Latin description. The general habit of this very nice plant is about the same as that of our British *Orchis laxiflora*, the flowers being of about the same size, and, as much as I could judge from a dried specimen, also of the same or a very similar colour. I received an authentic specimen (No. 51) of the collector from Professor G. Schweinfurth. *Dr. Kränzl.*

KEW NOTES.

THE following extracts are taken from the *Kew Bulletin*—

Under the title of "Hardy Species of *Eucalyptus*," mention was lately made in the *Kew Bulletin* (1889, p. 61) of seeds of *Eucalyptus globulus* received from Mr. Abbott of the Botanic Gardens, Tasmania, and collected from trees growing at high altitudes, and accustomed to be exposed to severe frosts. It was hoped that plants raised from these seeds would be likely to bear with impunity the rigours of an English winter. The seeds germinated very freely at Kew, and when the plants were strong enough, they were put out in a sheltered bay in the arbo-retum nursery in the middle of summer, in order that they might become established before the approach of winter. The result of the experiment in this particular instance was disappointing. The first hard frosts in 1889 so severely injured them that, notwithstanding the protection they afterwards received from a canvas screen, they all succumbed before the winter was over. At Kew these seedlings from Blue Gum trees accustomed to severe frosts in Tasmania were, if anything, not so hardy as those of the ordinary forms of *Eucalyptus globulus*. A similar result has to be recorded with plants raised from seeds of *Eucalyptus coccifera*, received at the same time from Tasmania, "from trees which were coated with icicles a foot long."

BERMUDA LILIES.

IT is pleasurable to record that the services rendered by Kew to the colonies is recognised by private persons, as well as through official channels. It will be remembered that in 1887 an exhaustive enquiry was made, under the auspices of Kew, into the Onion disease at Bermuda (*Kew Bulletin*, October, 1887). The cultivation of Onions is one of the principal industries of the colony, and the threatened destruction of the Onion crop was regarded by the people as a matter of grave concern. The inquiry made by Mr. Arthur Shipley, F.L.S., established the fact that the disease was caused by a parasitic fungus (*Peronospora Schleideniana*) allied to the well-known Potato blight. The remedial measures suggested by Mr. Shipley were practical,

* *Disa Stairsii*, n. sp.—Sepalo dorsali obtusissimo galeato antice subclauso, calcaris genuliflexo tenui duas ovarii partes equante (extenso ovario sublongiore); petalis late ovatis sub galea omnino absconditis obtuse acutis; sepalis lateralibus deflexis divergentibus obovatis involutis antice obtusis apiculatisque; labello lineari-ligulato obtuso sepalis aequilongis multo tamen angustiore.—Planta valida certissime bipedalis; folia linearia v. lineari-lanceolata acuminatissima 20 cm. longa ad 2 cm. lata, in bracteis similes decrescentia; spica longiuscula multiflora basi laxiflora ad 15 cm. longa; bractee lanceolatae aristate sub anthesi floribus paulo (arista) longiores basiales floribus multo longiores; flores 1–2 cm. alti, purpurei; labellum certissime pallidius. In monte Ruazari Africae orientalis colleg. W. Grant Stairs, v. c.

and it is hoped the disease is now well within the control of the cultivators. Besides Onions, Bermuda is also noted for the cultivation of Lilies (*Lilium longiflorum* var. *Harrisii*), and from Mr. W. T. James, one of the largest growers of these beautiful plants, Kew has received, in recognition of its services, a yearly present of bulbs for the decoration of its conservatories. These plants have proved of striking interest to visitors, and have been greatly admired.

ACANTHORHIZA ACULEATA, Wendl.

The large specimen of this Palm in the Palm-house, probably the largest in Europe, is now flowering for the first time. It has a stem 26 feet high, 23 inches in circumference near the base, which is clothed to a height of 1 foot above the ground with the curious spinous roots peculiar to the genus. The head is about 10 feet high, and is composed of about fifty leaves, which are orbicular

lector for the Royal Horticultural Society, and that, "it is also perhaps a native of Natal." In his recently-published *Handbook of Iridæ*, Mr. Baker says under this species, "Habitat, Transkeian Kaffraria, not certainly indigenous. Said by Herbert to be a native of Madagascar, but none of the recent collectors have found it there. Its nearest affinity is with *G. floribundus*." According to Herbert, *G. oppositiflorus* is one of the parents of *G. gaudavensis*, the other being *G. psittacinus*. *G. oppositiflorus* is now in flower at Kew. It is over 6 feet in height, the leaves are stout and ensiform, and the flowers, which are arranged on a spike 2 feet long, are 2½ inches across, the segments wavy and recurved, pure white, with lines of amethyst.

CYCADS AT KEW.

The collection of Cycadaceæ at Kew is the richest in existence, and many of the specimens are very large and of great age. A considerable number of

Sir Joseph Hooker has stated, "partly to the impossibility of determining them till they flower, and partly to the practice that prevails of attaching provisional names to seedlings which are unrecognisable both as to genus and species when in that state." (*Kew Report*, 1882, p. 10.) The houses at Kew afford exceptional facilities for the growth of most Palms to a large size, and as these flower they are carefully examined, and, if of sufficient interest, a figure of them is prepared for publication in the *Botanical Magazine*; since 1875 no fewer than nineteen species of Palms have been figured and described in this publication from specimens flowered at Kew. The following species are now in flower in the various houses:—*Acanthophœnix* Cunninghamii, *Caryota* Cummingii, *C. furfuracea*, *Chamædorea* polita, *C. pulchella*, *C. wobbstiana*, *C. Wendlandii*, *C. scandens*, *Chamærops* humilis, *Didymosperma* nanum, *Howea* Forsteriana, *Livistona* chinensis, *Pinanga* Kuhlîi, *P. patula*, *P. Smithii*, *Sabal* Blackburniana, *Stevensonia* grandifolia, *Synechanthus* fibrosus, *Trachycarpus* excelsus, *Wallichia* densiflora.

COLEUS TUBEROSUS, Benth.

A plant believed to be this species (= *Plectranthus tuberosus*, Bl.) is cultivated in Java for the sake of its edible tubers. The same, or a closely-allied tuberous Labiate (*Coleus parviflorus*, Benth.), is said to be cultivated also in Ceylon. Recently, tubers of the Java plant were obtained from Dr. Treub, director of the Botanical Gardens, Buitenzorg, and grown at Kew. The tubers were planted in an open border during the summer, and the crop was reaped in the middle of October. The tubers were fairly numerous, but small. They consisted of fleshy bodies, broad at the top, and narrowing gradually to a point. They were of a light-brown colour, and averaging in size about 1½ inch long, and 1 inch in diameter. It is probable that the tubers attain a larger size in the tropics. A further trial will be made next year, and in a more sandy soil. When a sufficient number of the tubers has been raised at Kew, they will be distributed for trial in the lowlands of West Africa and the West Indies, where the ordinary Potato, for which the *Coleus* tubers are said to be a substitute, cannot be successfully cultivated. A tuberous labiate (*Plectranthus madagascariensis*, Benth.), described in Baker's *Flora of Mauritius and the Seychelles*, p. 258, is occasionally cultivated in Madagascar and Mauritius. In the latter island it is known as Oumime or Houmime. This plant has a wide distribution, and is found also in Arabia Felix and Natal. In November, 1887, Kew received from Mr. Medley Wood, A.L.S., Curator of the Botanic Gardens at Durban, Natal, tubers of two varieties or species of *Plectranthus*, known locally as "Kaffir Potato." We have botanical specimens of these plants in the herbarium (Natal, 646 and 3633), and they are evidently quite distinct from *Plectranthus madagascariensis*. A specimen just to hand in the Transvaal collections of Mr. Galpin agrees with Mr. Wood's specimens from Natal. The tubers received by MM. Pallieux and Bois from the Transvaal under the name of "Matambala," and referred by them to *Coleus tuberosus* (*Revue des Sciences Naturelles Appliquées*, 1891, p. 684), may prove to be identical with the "Kaffir Potato" (*Plectranthus* sp.) of Mr. Medley Wood, or even with *Plectranthus madagascariensis*. In any case, they have been distributed from Paris to the Gaboon and other French colonies, and are said to thrive there extremely well. *Kew Bulletin*.

IRIS HISTRIO.

We subjoin an illustration of this plant, which was originally described in the *Botanische Zeitung*, 1871, by Professor Reichenbach, and which was figured in the *Garden*, t. 653, f. 1, and in the *Botanical Magazine*, t. 6033. It is a native of Mount Lebanon, whence it was introduced into cultivation about 1873. Mr. Baker, in his *Handbook of Iridaceæ*, considers it scarcely more than a variety of *Iris reticulata*, but as exhibited by Messrs. Ware on

FIG. 111.—IRIS HISTRIO: FLOWERS, PALE BLUE AND WHITE, WITH PURPLE SPOTS AND GOLDEN BLOTCHES.

palmate, 5 feet in diameter, dark green above, silvery below, split nearly to the base into about sixty segments. The petioles are 3 feet long, unarmed, the margins clothed with white thread-like fibres, 9 inches or more long. The inflorescence is a branched drooping dense panicle of white flowers, which are hermaphrodite. A figure of the plant has been prepared for the *Botanical Magazine*. The species is a native of Central America. It has also been called *Chamærops stauracantha* and *Thrinax aculeata*. The other species of this genus, viz., *Acanthorhiza arborea*, is also in cultivation at Kew.

GLADIOLUS OPPOSITIFLORUS.

Corms of this interesting plant were sent to Kew in July last by Professor MacOwan, F.L.S., Government Botanist at Cape Town, who obtained them from the Transkei, where it is said to be common about the Kei River. The species was described by Herbert in Lindley's *Botanical Register* in 1842, who says it was found in Madagascar by Forbes, a col-

lector for the Royal Horticultural Society, and that, "it is also perhaps a native of Natal." In his recently-published *Handbook of Iridæ*, Mr. Baker says under this species, "Habitat, Transkeian Kaffraria, not certainly indigenous. Said by Herbert to be a native of Madagascar, but none of the recent collectors have found it there. Its nearest affinity is with *G. floribundus*." According to Herbert, *G. oppositiflorus* is one of the parents of *G. gaudavensis*, the other being *G. psittacinus*. *G. oppositiflorus* is now in flower at Kew. It is over 6 feet in height, the leaves are stout and ensiform, and the flowers, which are arranged on a spike 2 feet long, are 2½ inches across, the segments wavy and recurved, pure white, with lines of amethyst.

PALMS IN FLOWER AT KEW.

Although Palms have always been in favour with cultivators, and this popularity has largely increased in recent years, their nomenclature, especially in gardens, is considerably confused. This is owing, as

Tuesday last at the Royal Horticultural Society, and as communicated to us a few days previously by the same firm, it is of a much paler lavender colour than is usual in *I. reticulata*. Our figure, from a drawing by Mr. W. G. Smith, gives a good notion of the flower. The sepals are marked with darker spots and golden-coloured veins. It is a charming pot plant for the greenhouse or cold frame, and flowering, as it does, at this season, it will be highly prized. Like *I. reticulata*, this has a small, egg-shaped corolla, from which the linear sharply-angled leaves proceed, together with the flowers. The pots of this plant shown by Messrs. Ware constituted one of the novelties of the excellent show at the Royal Horticultural Society on Tuesday last, when most people, we imagine, were surprised to see so fine and interesting a display in mid-December.

ORCHID NOTES AND GLEANINGS.

FLOWERING OF CATTLEYA ALEXANDRÆ.

SEEN in your recent issue that Messrs. Linden, of Brussels, have flowered the remarkable *Cattleya Alexandræ*, it is with some degree of pleasure that I am enabled to say that it flowered here four days before the Birmingham show. It is a very useful flower for a buttonhole, and it was worn as such at the Birmingham show. Mine is a good form of it, as it quite represents and confirms the indications of the ideas as originally stated in the *Gardeners' Chronicle*. We have a grand collection of Orchids for so small a place. *C. Sims, Gardener to Saint Hill Park, Esq., Brierly Hill, Staffordshire*. [Flowers were shown at the Horticultural Society on Tuesday last, but they had passed their best. Ed.]

CYPRIPEDIUM CHAMBERLAINIANUM.

There has now been time to form an opinion in regard to this, one of the latest of Messrs. Sander's introductions. I have no doubt that it will prove to be one of the most vigorous growers that we possess. When the plants were received in the condition of imported plants, they were placed in a Melon pit, or rather, what was originally a Melon pit, some sphagnum was spread on the front stage, where there is bottom-heat, and more sphagnum being placed between the plants as they were arranged, each plant having been previously sponged over, and the leaves carefully tied to neat stakes. Here they commenced to make new roots in a very short time, and were in due course potted. Most of the pots are now so full of roots that we are giving them another shift. They are making broad healthy leaves, and the one which we flowered was fully equal to the best variety that I have as yet seen.

The next question is, who is to be first with a seedling from this new-comer. The dorsal sepal is a trifle deficient in size, and if the species is crossed with a large-sepaled variety, where the distinct and pretty colouring of the pouch can assert itself, we may expect some beautiful offspring. *Jas. Brown, Ardarauch, N.B.*

NURSERY NOTES.

CYCLAMENS, &c., AT ST. GEORGE'S NURSERY COMPANY, HANWELL.

VISITORS to the metropolitan exhibitions are doubtless familiar with the fine displays of Cyclamens made by this company. A visit to their home quarters, where the plants occupy a number of houses, is necessary to afford some idea of the extent of the culture of these now popular flowers, the principal characteristics of the strain under notice consisting of a beautiful diversity in shades of colour, profuseness of bloom, and robust growth, combined with good habit. Whites are in strong force, as these are much sought after, and we noted as extra fine representatives of this colour the following:—Mont Blanc, Baroness Burdett-Coutts, Dame Blanche, a very broad-petalled flower; and a seedling not yet

named, which promises to eclipse other things in this way by its extreme purity, wonderful substance of petal, and generally excellent characteristics; a beautiful soft pink is Princess May. Mr. Avery, the able grower here, thinks so much of this new aspirant to fame, that he has sown one thousand of it for next year's work. Other good new sorts were noted in Duke of Connaught, purple, of fine form; Brilliant, deep red; another good red is Crimson King Sunray, light purple, a very pleasing flower.

Some 26,000 plants (seed was sown in August last for next year's requirements), look healthy and thriving, pricked off twelve in a pot. At the end of January, or beginning of February next, they will be transferred to thumbs, then to the market-sized pots (48's) as they require it. The soil used is the Banstead rich yellow loam, to which is added leaf-mould and silver-sand. Pretty firm potting appears to be an essential to success.

Cyclamens are not the only things done well here. A wonderful batch (perhaps the best in the trade), in a house 220 feet in length, of *Asparagus tenuissimus* was noticed. This is a pretty and graceful species, with delicate foliage, useful for cutting purposes. Here it has quite displaced the Maidenhair Fern, as it is used for a variety of purposes for which the Maidenhair is not adapted. *A. plumosus* and *A. p. nanus* are also grown in quantity. It has been noticed here that the latter form loses its character if not kept starved and confined to small-sized pots. The pretty *Eulalia japonica* is in much request. Some 5000 *Calla æthiopica*, in admirable condition, were noted. Raspail is the favourite variety of *Pelargonium* grown. *Chrysanthemums*, of which a select collection is grown, were attractive at the time of my visit, a fine bank of some 500 plants of the well-known Mons. Astorg making quite a feature in the floral display. *B.*

MR. K. DROST'S, RICHMOND.

This establishment is noteworthy as being the only place in this country where the forcing of Lilac for market and other purposes is carried on in an extensive manner. About 12,000 plants are forced yearly, this process beginning in October, and being carried on to the end of June.

It was certainly an agreeable surprise, at this comparatively flowerless period of the year, to see a mass of plants with their waving plumes of white flowers. Speaking of the French forced Lilac, Mr. Drost says that in the bud stage it is of a greenish hue, whilst that of English growth is a pure milky-white, a characteristic which is also noticeable when the flowering state is more advanced.

Of other subjects forced here largely, may be mentioned *Hydrangea paniculata grandiflora*, *Azalea mollis*, some 200,000 each of Lily of the Valley and Tulips (double and single), Roman Hyacinths, and other bulbs.

A great specialty is to be found in the fine collection of Palms; the plants, which occupy several houses, are grown in 32-sized pots and upwards, presenting a remarkably healthy and hard appearance, indicative of good and careful culture.

It is considered that one of the best stocks in England—perhaps in Europe—is to be found in this nursery of *Cocos flexuosa*, some 500 fine plants, varying from 10 feet to 15 feet in height. *Cocos plumosa* is also represented by a fine stock, whilst the well-known and now, it would seem, almost indispensable *C. Weddelliana* is much in request, quite a forest of it being grown. *Phoenix canariensis* is a very good Palm, and one that ought to be better known. *P. rupicola* possesses the merit of being a good grower. *Areca lutescens* was noted as splendid stuff. The favourite Kentias are *K. Belmoreana* and *K. Fosteriana*. The popular *Latania borbonica* is, as it deserves, largely grown. *Corypha australis* is another favourite market Palm. *Senforthia elegans* makes a worthy finish to the fine stock of Palms grown.

Amongst miscellaneous plants worthy of a note may be mentioned *Dracena Brantii*, a plant of graceful habit, with fine dark foliage; it will super-

sede *D. rubra*. An elegant table plant is *Reineckia carnea variegata*. Another useful table plant is *Ophiopogon Jaburan*. A good stock was observed of a variegated *Carex*, with erect habit—a very suitable plant for decorative purposes.

Good basket plants are *Bambusa Simmonii* and *Maranta Massangeana*; *B. Fortunei aurea striata* is an effective plant, of a beautiful dwarf habit of growth. Bamboos are grown in variety for decorative and cut purposes. The only two species of Ferns grown are *Adiantum cardiochænum*, which is represented by a vigorous stock, and *Onychium japonicum*, a very beautiful greenhouse form. *Ancubas* in pots are grown largely for boxing purposes—good dwarf stocky stuff. *B.*

ROUND MANCHESTER.

(Continued from p. 702.)

BROOMFIELD, SALE.—On calling at this place recently, the residence of M. Wells, Esq., that gentleman accompanied us during the brief visit that we made to see the selection of rare Orchids which find a home in the neat block of Orchid-houses, and which will doubtless be extended as the collection increases in size and calls for more space. The plan of forming a collection adopted by Mr. Wells is a wise one, and that is to purchase, as a rule, only species and varieties which have been proved to be worth growing. And in carrying out this idea he shows much liberality, for a price running into three figures is no obstacle, provided there is a fair warranty that the plant is sufficiently distinct, rare and unlikely to become any other than rare. This is a safe and satisfactory course, if care is taken in purchasing, for in almost every instance where fine novelties, and especially "albinos," have flowered out of importations, the first price obtained is rapidly improved upon, and the value of the plant or those propagated from it has gone up considerably, and in some cases to a surprising pitch, as witness *Cyripedium insigne Sanderæ*, and many others that we could name.

Passing through the lobby to the first house, Mr. Hinde, the gardener, who seems to know instinctively every little want of his plants, lovingly displayed rarity after rarity, and those which were in flower bespoke plainly enough that the merits of those not in bloom were not likely to be exaggerated; whilst the perfect health of all the plants showed the utmost good culture. There is a robust and hardy appearance about well and fairly-grown plants, whose course for the year is so arranged that they complete their year's work within the year, and are neither forced to do more than that, nor prevented from doing less. This shows that the object of growing the plants is grasped, and that in all probability the collection will be maintained and increased in beauty and size, and not suddenly collapse, as is the case in some gardens where Orchids have been badly grown, and their cultivation then given up.

At length, after going the round of the houses of finely-grown *Dendrobiums*, containing plants of *D. nobile nobilus*, *D. n. Cooksoni*, various hybrid *Dendrobies*, *Cymbidium Parishii*, *Lycaste Skinnerii alba*, some splendid forms were observed of *Lælia anceps*, including the new one of the *L. a. Amesiana* class—a great beauty selected from an importation out of the Liverpool Horticultural Co., the noble *Cyripedium Leeanum giganteum*, and other *Cyripediums*. We were then shown a fine selection of *Cattleya labiata*, of which *C. l. Albanense* is the best, and, wonder of wonders, as a *bonne bouche*, a pure white autumn-flowering *Cattleya labiata* out of Sander's importation, one of those plants which are beyond price, and about which comment is unnecessary. See Report of Orchid Committee, R. H. S., p. 711.

Passing through the ornamental greenhouse, gay with *Chrysanthemums* and *Rhododendrons*, and fragrant with the flowers of *Daphne indica odorata*, a house is arrived at in which are some fine *Dendrobies*, and amongst them *D. Venus*, × *D. nobile*, Hardy's var., and a grand form of *D. Wardianum*, which has flowers $\frac{1}{2}$ inches across. Then the cool

Odontoglossum-house is visited. It is filled with vigorous Odontoglossums; and some plants of *Oncidium tigrinum* and *Sophranitis* are in bloom. The *Cattleya* and *Lælia*-house contain specimens which are as well grown as in those in the other houses, and finally a visit is paid to the warm-house, in which thriving *Vandas*, &c., are found. Among the *Cattleyas* here are some special fine varieties of white *C. Mossiae*, grand forms of *C. Mendelii*, *C. aurea*, *C. Massaiana*, *C. Warscewiczii*, *Lælia elegans Turneri*, &c., and, indeed, in almost every species the best forms only seem to have been acquired.

POTATO DISEASE PREVENTION.

We annex reports of Potato treatment by ourselves and all our friends who have tried it. Every one of them is highly satisfactory, and the only regret is from those who did not treat their whole crop. This is our second year's experience, and confirms that of last season. Our average gain last year was 33 cwt. per acre; this year about 35 cwt. As might be expected, the gain of others whose crop was put in later or on more suitable land is much more than ours.

We tried a good many plots with treacle mixture, but in no case did it do good.

We do not like to burden you with dates and number of applications, but may say we consider that one dressing about July 20, and another about a fortnight later, has been the most satisfactory.

All the copper sulphate used in these experiments was of guaranteed purity. If any of your readers have not found the dressing satisfactory, we would be much obliged for a sample of the copper sulphate they used, so that we may test it.

Champions.—Average of 8 Plots on Two Farms.

Dressed ...	7	9	2	1	11	2	0
Undressed ...	5	13	2	1	6	3	10

Smallest gain, 19 cwt. per acre, was on a plot dressed on July 11 only. Evidently when dressed so early, a second treatment later would have been required.

Antrims.—Average of 6 Plots.

Dressed ...	11	1	0	0	14	0	none.
Undressed ...	9	12	0	0	16	2	none.

Owing to soil being heavy, and season wet, our crop is not up to the average. On drier land the dressing would have had more effect, as is shown by annexed reports from others. The Antrim we consider a very heavy cropper, remarkably free from refuse and excellent for the table.

SELECT DECORATIVE FOLIAGE PLANTS.

(Continued from p. 710.)

DRACENAS.—In *Dracenas* we also have a large number of varieties, and it depends a great deal upon the conditions they are seen under as to which are the most desirable, but for ordinary decoration the following may be regarded as the most useful, and in many respects the best. Of the narrow-leaved red varieties, *D. elegantissima* is a general favourite; *superba* colours freely, and makes an elegant plant; *angustifolia* is another fine variety; *Lord Wolsley* is a little broader in the leaf than the above-named sorts, colours well, and makes a beautiful plant. Among those of medium growth, *Frederica* is one of the finest, pendula colours freely, and *Alberti* is a pretty and desirable variety; *Cooperi* is still a favourite. The last four, though not narrow-leaved varieties, may be recommended as table plants, the leaves being recurved, and not so close growing as many varieties. Mrs. R. Turner, a dwarf-growing variety, colours freely, the terminal leaves being of a peculiarly bright rosy tint. *Sajonti* is somewhat after terminalis, but has broader leaves, colours freely, and is very effective. *Prince Manouk Bey* is a very distinct and showy variety, with long erect leaves of a distinct shade, almost magenta. It is an effective variety for groups. *Madame F. Bergmann*, *Rossi*, and *Thomsoni*, are broad-leaved showy varieties, and *stricta* may also be included. The last-named and *terminalis* are extensively grown for market work. Of varieties with white variegation, *D. terminalis alba* is one of the most useful. *Alexandra* is a show variety, the terminal leaves are a pure creamy-white. *Louisa*, a very pretty narrow-leaved variety, makes a nice table-plant. Of the more distinct varieties *Goldiana* is worthy of notice, erect in growth, the broad leaves spread horizontally, and are bright green, marbled with silvery-grey. *Lindeni* has broad recurved leaves, striped and margined with yellow, a very effective plant for groups. *Massangeana* is sometimes confused with the last-named, but it has not such a good colour, the variegation being confined to a linear band of pale yellow. The last three should be propagated from tops or side-shoots taken off close to the old wood. A plant with a good stem will give a lot of stock. After the top has been taken, the eye nearest the top will break, and as soon as large enough may be taken off, when a number of others will follow in succession. They will root freely in sandy peat. The cuttings should be kept in a close pit where there is a good bottom-heat.

The above treatment can also be applied to all the *Dracenas*, but in the majority of cases use should be also made of the stems, which may be dried off, and then cut up into short lengths or laid in whole, when most of the sorts will break freely, and may be taken off with some roots as soon as they are a few inches high. These will require to be kept close until they have made a start. In growing the plants on, they require some care to keep them in a healthy condition, and they must not be allowed to get pot-bound, neither should they ever be over-watered. Plants propagated from the stems are apt to run up tall before they colour, in which case the tops should be cut off and rooted again.

Dieffenbachias.—A little too stiff for table-plants perhaps, but very effective in groups. *D. Bausei* is one of the most useful. *Reginae*, *magnifica*, and *Shuttleworthi* may also be recommended. The *Dieffenbachias* may be propagated in the same manner as *Dracenas*, and are of easy culture. Pot in a rough porous compost, and after they are well rooted, give them a liberal supply of liquid manure;

in a moderate stove temperature they will soon make fine plants.

Alocasias.—Of these *A. Sanderiana* is a most effective plant, the sagitate leaves are borne on rather long stalks, and are of a bright metallic green, with a band of silvery-grey down the midrib and chief veins. It may be propagated from suckers, and should be potted in rough peat and loam; some sphagnum moss may also be used—give plenty of drainage and a stove temperature. *A. metallica*, *A. reginae*, and *A. zebrina* are desirable species. They may be propagated from suckers or divisions, and potted in rough open compost. A stove temperature is required, and they will soon make fine plants. When making growth, liquid manure may be used freely. This applies to all the *Aroids*, and if this is made from cow-dung and soot, it will be the best stimulant that they can have, and will much improve the foliage both in size and colour.

Anthurium crystallinum and *A. Veitchi*, are noble-looking plants, though not much grown at the present time.

Phrygium variegata (*Maranta arundinacea variegata*) is a most useful plant, and very distinct; the variegation is uncertain, but treated properly, a large percentage of the leaves will be well-marked; some of them are almost white, others irregularly striped. It may be propagated freely from divisions. When dividing the plants, the shoots with most green in them should be discarded. Light sandy compost may be used, and plenty of drainage. While plants frequently divided, and grown in light sandy compost will keep the variegation well, plants grown on into larger specimens without being disturbed will gradually revert to the normal green form. Plenty of atmospheric moisture must be given, or red-spider will be troublesome. O.

(To be continued.)

FOREIGN CORRESPONDENCE.

EUROPEAN RHODODENDRONS.

ALLOW me to state, in reference to Mr. Watson's article on *Rhododendrons*, that in Europe nine species are known, viz.:—*R. hirsutum*, L.; *R. ferrugineum*, L.; *R. myrtifolium*, Schott & Kotschyk, *R. Chamæciatus*, L.; *R. lapponicum*, Wahlberg, Norway; *R. Simmonsi*, *R. ponticum*, *R. Ungerni*, and *R. caucasicum*, Pallas. O. Forster, *Lehenhof*, near *Scheibbs*, Austria.

TREES AND SHRUBS.

RETINOSPORAS.

RETINOSPORAS are very accommodating, and will thrive in almost any garden soil so long as it is not too heavy; the following is a selection of the most ornamental, and will be found to include the best and most useful sorts.

R. ericoidea might be called the king of small growing *Conifers*, as it makes such a splendid thing all months of the year; whilst in a growing state its delightful foliage is of a rich pea-green colour, and in the autumn it assumes a brownish appearance, somewhat similar to *Cryptomeria elegans*, which it retains until the following spring. It is one of the oldest sorts grown, and rarely exceeds 3 feet in height; its short branchlets are covered with narrow-pointed leaves about 1/4 of an inch long, and rather glaucous beneath.

R. plumosa is very valuable either for large or small gardens, for if it grows too fast for the position in which it is placed, it can be cut hard into the old wood, which does not seem to hurt it, as it soon grows away again very freely. It is well supplied with lateral shoots, the deep greenish colour of whose foliage stands out in great prominence to that of the others; it forms a very handsome tree, and looks well if planted as single specimens on the lawn. It has

several varieties more or less of a showy nature, some being very desirable. First place must, of course, be accorded to the one with golden foliage, met with in gardens as *plumosa aurea*; this is without doubt the prettiest, and at the same time the most desirable of all the variegated *Retinosporas*, and one that can be used advantageously for the greatest number of purposes. It should on no account be left out of a collection of six fine-coloured Conifers; in a young state it is extremely valuable for pot work, as it thrives very well on balconies, and has a charming appearance on window ledges, &c., provided it is not neglected in the matter of watering. One essential should never be overlooked, in fact, too much care cannot be bestowed upon it, namely drainage; simple though it appears at first sight, the future health of the plants will to a certain extent depend upon it, for if the drainage is bad very little success will attend the efforts spent, as the plants will soon lose their bright colour and wear a dismal and sickly look. In watering this plant it will always be advisable to damp the foliage also, as it delights in being kept moist, and I am of opinion that if the syringe was used more freely and the foliage kept clean, many plants which hitherto have been failures would be found to do better in towns. It is one of the best things that can be found for winter bedding, its colour being so striking as to give to the whole a bright look even in the depth of winter. When planted as single specimens it should, if possible, be in full sunlight, as that plays a very important part in the colouring of plants; a damp position is preferable to a dry one. Another variety which goes well with the last is *R. p. argentea*, this, as its name implies, has silver-coloured foliage; the tips of the shoots are prettily marked with white, and like the last mentioned, it forms a good-sized tree. *R. pisifera* is a very free grower, and well worthy of finding a home in any well-kept garden; its branches are more spreading than is the general rule with this class of plants, its foliage is vivid green, and always presents a neat appearance, and like *plumosa* it is possessed of a few varieties which are very attractive. *R. p. nana aurea* is a subject better suited for the rockery than the ordinary shrubby border; it is seen at its best in a good open position fully exposed to the sun, and then it will retain its colour throughout the winter months. *R. obtusa*, introduced into this country about forty years ago, has become established, and good-sized specimens can be met with in several places; it is very distinct both in habit and foliage, which is bright shining green above and silvery beneath, plentifully furnished with spreading branchlets. It is one of the tallest growers, often attaining a height of something like 80 to 90 feet; the wood is very durable, and used for a variety of purposes. *R. obtusa aurea* takes the form of *obtusa*, but differs in having foliage of a beautiful rich golden colour. *R. obtusa erecta viridis* is a variety which seems to be very little known, it is rather a loose-growing kind, and makes a very nice thing planted as single specimens; it is a free grower even in poor sandy soils, and is not at all particular as regards position, which is in itself a recommendation worthy of consideration—its small scale-like leaves are deep green, a colour which it keeps right through the winter. *R. squarrosa*, with its needle-shaped leaves, is entirely different to any of the foregoing, the foliage is of a greyish-green colour; it is a very free grower, but to keep it a nice shape, the knife must be used freely. *R. filifera* is, perhaps, the most graceful Conifer grown, yet it does not seem to have found the favour with planters it deserves; grown by itself as single specimens dotted about in the grass, the good qualities of this fine Conifer are very noticeable, and is one which should find a place in every garden. It forms a dense tree with pendulous thread-like branchlets; the leaves, which are sharply pointed, are of a pleasing dark colour, and like *obtusa erecta viridis* it will flourish in poor soils. *R. lycopodioides* is so distinct from the rest, that I have included it in this list, though it is not possessed of any showy qualities—it is, nevertheless, a nice thing, and very different from the others of the same family; it forms a low tree of irregular growth with numerous branchlets, some of which are flattened towards their ex-

tremities, with crowded, small, scale-like leaves of a deep shining green. *R. leptoclada* forms a distinct close upright grower, reaching a height of 9 to 10 feet; it delights in a damp position, and will not thrive with anything like satisfaction if the ground is dry and hard. It makes a pretty thing for winter bedding, but in whatever position it may be planted, it should be freely supplied with water while it is growing; its numerous branchlets are produced so freely as to completely hide the main stem. Its foliage is of a pea-green colour, and associates well with *ericoides*; it also looks very nice if planted at intervals in the shrubby border.

The general mode of propagating the *Retinospora* is very simple: the cuttings should be made from 2 to 4 inches long of the current year's growth, and well ripened, with a little old wood attached; this is not absolutely necessary, yet it will be conducive towards root formation. No artificial heat is required if a cold frame is at hand; a good bed of soil composed of peat loam and sand in equal proportions, and made firm, the cuttings being dibbled in rows down the frame, and by the next autumn they will have made nice little stuff, and the following spring will be ready for planting in the open ground. Or if they are to be grown on for winter bedding, they must be potted and plunged outside up to their rims. Some of the less-shy growers do not root so freely as *plumosa*, *ericoides*, &c., consequently a slightly different treatment is necessary; if the cuttings are put into pots and placed in cold frames until they callus, it will be of great assistance to them if they can then be put into a gentle heat to encourage roots. II.

FRUIT REGISTER.

APPLE BEAUTY OF NORDHAUSEN, "SCHÖNER VON NORDHAUSEN."

A DESSERT and culinary variety raised by Karl Kaiser, nurseryman, Nordhausen. Season, October to the end of May; size, 2½ inches broad, 2½ inches high; generally larger than smaller than this size, round, flattened top and bottom, swelling out in the middle, the halves not equal. The eye mostly open; segments greenish, slightly felted, at the base broad, but scarcely touching each other, running sharply to a point mostly reflexed; eye-basin moderately deep, with prominent pleats or ribs; stalk woody, brown, short, seldom higher than the cavity out of which it springs; rind firm, smooth, shining, light greenish-yellow, changes to bright yellow washed with red; round about the stalk, russety; aroma pleasant, and the fruits never shrivel; tree vigorous and tall growing. This novelty is very highly recommended by A. Koch, Garten Inspector, Brunswick. *Müller's Deutsche Gärtner Zeitung*.

THE CHICAGO EXHIBITION.

WE take the following details from an article by Mr. James Dredge in the *Journal of the Society of Arts*:—In the spring of 1891 the work of preparation in Jackson Park commenced; this in itself was a gigantic labour. At the time when it was handed over to the exhibition executive, excepting for a small reclaimed portion, it was a wholly unreclaimed marshy tract, with a scanty vegetation of Scrub Oak. To obtain the necessary levels, 1,500,000 cubic yards of earth had to be obtained from some source, and distributed over different parts of the park. This necessity rendered the introduction of extensive waterways and lakes inevitable, because the only means of obtaining the material required in some places, was to excavate it from others. Messrs. Olmsted & Co. quickly learned how to turn this necessity to useful account, and the waterways of the Exposition grounds will be one of their chief attractions. The problem that was presented for solution to the executive in the spring of 1891 can perhaps be best described in Mr. Burnham's own words: "It was necessary that the vast area of Jackson Park should be reclaimed, and in twenty

months transformed from a desolate waste into a park highly improved and embellished with all that skilled designers could suggest; that upon the stately terraces a dozen or more palaces of great extent be constructed, and that they be supplemented by over 200 other buildings, some of which are almost of the importance and size of the main structures; that great canals, basins, lagoons, and islands be formed; that extensive docks, bridges, and towers be constructed. It was necessary that a standard of excellence be obtained which would place the work upon an equality with the monuments of other ages—it meant, in short, that an organisation be quickly formed which would associate together the ablest architects, painters, and sculptors of the world. Many of the great problems to be solved were new, no precedent having been established for the guidance of those assuming this great responsibility."

The Horticultural Building.—The ground occupied by the Horticultural Building is nearly 6 acres. Its design is admirable, and on a scale harmonising with the rest of the Exhibition. The great constructive feature is the central dome, 180 feet in diameter, and about 140 feet in height. This dome occupies the centre, and is surrounded by a square court, roofed, and about 30 feet in height. The main entrance to the building is in the centre of this court, and on each side within it is a wide circular staircase, lighted from a small dome that forms a conspicuous feature in the design. To the right and left of the central court run two galleries: one in the front is 69 feet wide, and 272 feet in length; at the rear is a second gallery, which passes behind, but adjoins the central court; it is about 750 feet long, and 50 feet wide. The latter gallery will thus form a continuous series of glass-houses, maintained at different temperatures for varying floricultural exhibits. A clear space, 89 feet wide, and 272 feet long, separates the front and rear galleries on each side of the dome, and forms two large open courts that will be utilised for horticultural displays. Each court is inclosed at the outer end by a spacious wing 118 feet wide and 250 feet long. Thus the whole building consists of the central dome and its surrounding covered court; of two spacious end wings, connected with the central court by a gallery in front and one at the rear, these galleries being spaced far enough apart to inclose two extensive open courts. A few words may be added about the constructive features. The dome is carried by a number of curved ribs built of steel of very light dimensions, and of the same general character as has been already referred to. The foundations are of timber, similar to those of which a type has been already described. The ribs supporting the dome are not curved from the floor line, but rise vertically, like a great circle of stanchions within the inclosing court, as far as the level of the gallery running round the dome, 22 feet above the floor; above this the curving is commenced, and the ribs, converging almost in a semicircle, meet overhead against a ring to which they are riveted. The height of this ring above the floor is about 120 feet. There are twenty of these great ribs in all; they are connected together in various ways, besides the central ring at the top. At a height of 22 feet above the floor, and again at 37 feet, a series of light girders connects each rib around the circle. Between the upper row of these girders and the crown of the dome, ten rings of purlins, made of angle-iron and lattice like the ribs, only lighter and not so deep, are riveted to the ribs. Thus the whole surface of the dome is divided into panels, and every panel is braced by diagonal tie-roads. Midway between each pair of ribs, a secondary rafter, curved to the same form as the ribs, is riveted to the purlin, thus further dividing the panels and affording means for attaching the minor framing and sash bars. The front gallery is wholly of wood and glass. The roof trusses are peculiar in consisting of eighteen boards 12 inches wide by 1 inch thick, bent into a circular form and lightly braced. The span is 69 feet, and the height to centre is 38 feet. These trusses are placed about 25 feet apart. The rear gallery, which is much narrower than the front one, is covered with

a light pitched roof, and the construction of the wings calls for no particular notice. These wings are not intended for the display of plants in growth, so much as for horticultural and other exhibitions. Glass does not, therefore, enter so largely into the construction of these wings as in those of the other parts of the building.

COLONIAL NOTES.

QUEENSLAND ACCLIMATISATION SOCIETY.

THE twenty-ninth report shows that more than 17,000 useful plants were distributed by means of this institution during the year. A list of Orchids available for exchange is given. The society, which was established in 1863, has outlived similar societies established in England and in New South Wales. Mr. Soutter is the secretary and manager.

RUBUS FLAVUS.

From seeds received from the Botanical Gardens, Saharanpur, India, several plants of this Raspberry were raised, and during the past year the specimen plant that was placed outside has fruited. The plant grows most luxuriantly, and fruits freely. The fruits are borne on the terminal shoots of the current year's growth, and form loose panicles, containing from six to eighteen separate fruits on each; they are of a pale yellow colour when ripe, and possess the full Raspberry flavour, with a delightful subacidity which renders them most palatable when eaten raw. A small quantity were made into jam, which turned out well as regards flavour, but the colour was not desirable; this could, of course, be overcome by the addition of colouring matter. Several plants have been sent to various parts of the colony, and seem to thrive equally in inland, upland, and coast-land localities. It is a plant of very robust growth, making shoots from 1 inch in diameter at the base, and from 8 to 12 feet long. It is most easily propagated from layers, and needs no particular treatment in cultivation. From its strong-growing habit, and the fact that it is armed with formidable spines, it is a most suitable plant for placing round the boundary fences of orchards to exclude marauders. In appearance the plant is rather ornamental; it is evergreen, with very pretty soft green foliage, the young shoots being clothed with a dense mass of beautiful dark red downy-looking hairs. Experiments are being carried out with the plant as regards how it will bear pruning, the idea being to see whether it will increase or diminish its fruit-bearing qualities. If it will stand hard cutting, its value as a fence plant will be considerably increased. The society have a stock of plants ready for distribution, and recipients are admonished to give the plant a fair trial, and report results. *Queensland Acclimatisation Society's Report.*

FLORISTS' FLOWERS.

CHRYSANTHEMUM SPORTS.

ONE of my plants of Mrs. S. Coleman has this year produced three flowers of Princess of Wales, and none of the ordinary kind, thus reverting two generations in one season; the variety known as Miss M. A. Haggas, coming in the direct line between these two. I do not know if the above is in anyway unusual; it has never occurred with me before, although several kinds have reverted one generation. I wish they would move in the other direction as easily as they go backward. *W. H. Divers, Ketton Hall Gardens, Stamford.*

THE SHOW AND FANCY PELARGONIUMS.

These are still indispensable at flower shows that are held during the months of May and June, and no more beautiful objects can be grown for the decoration of the greenhouse and conservatory. The name show, as applied to Pelargoniums, is misleading to some persons, because they have arrived

at the conclusion that they are only adapted for exhibition purposes, and are too refined in character for the purposes of greenhouse or conservatory decoration, and hence they take to the section termed decorative. We have a class of decorative Pelargoniums, decorative Dahlias, and other classes of florists' flowers to which this term is applied, and although the term is misleading, doubtless it will continue to be used. I consider it misleading in this sense, that if the term is exclusively applied to one section only, amateurs might reason that the other sections are not decorative, whereas the very reverse of this is the case, because from the point of view of the florist, the show and fancy Pelargonium are even more beautiful than the so-called decorative varieties, not only giving as good or better masses of colour, but the beauty of the individual flowers is more striking, and will bear the closest scrutiny.

The fancy varieties are simply lovely when well grown, and arranged amongst graceful-leaved foliage-plants. The so-called decorative varieties are more hardy than either of the above; the plants are generally of a more sturdy, compact habit, and produce a very dense crown of blossoms. They require the same treatment as the show and the fancy varieties as regards culture.

The objections many amateurs have to growing Pelargoniums arises from the trouble it takes to free the leaves from insect pests. Greenfly is their dreaded infestation, and when once this troublesome parasite has become well-established, it is really a difficult matter to get rid of them. A careful gardener will fumigate with tobacco before the insects are seen, as prevention in this case is not only better than cure, but it also costs less. Growers for the market, who have found the decorative varieties the most useful for their purpose, now complain that it does not pay to grow them so well as it does to grow other things, such as Aspidistras, Grevilleas, or even Paris Daisies. Certainly Pelargoniums, although very beautiful, either as greenhouse or window-plants, are not so useful for furnishing as many other things, and to see them standing on the costers' barrows on a cold, windy morning in Wellington Street, the petals drifting like snowflakes in the roadway, one has no difficulty in pronouncing them unfit for the barrow trade. They have still an important place in the greenhouse and conservatory, and as such a few cultural details suitable for winter may be of service to many young gardeners and amateurs. The specimen flowering plants are cut down in July or August as it happens to suit the plants. They should be quite dry at the roots at this time, and ought to be cut back to a good bud, leaving about 2 inches of the new wood of the present year. Give no water for three or four days after cutting down, and by that time, the cut portions will heal over. Stand them in an open position out-of-doors, and give a thorough watering to entirely saturate the soil; when some growth has been made, let the plants be turned out of their pots; the greater portion of the soil should be removed, and the plants be repotted again in a size smaller. After being repotted they must either be put in a greenhouse near the glass roof, or in pits or frames from which the glass lights should be removed when they are not needed, to protect the plants from heavy rains; in either case air should be admitted freely night and day until very cold weather sets in, late in the autumn. At this season the plants ought to be arranged quite close to the glass in a greenhouse, or heated pit; low lean-to pits are about the worst place for them, and airy span-roofed pits or houses the best. They require plenty of air on all favourable opportunities, but of course, in frosty or foggy weather the lights have to be closed. By this time the plants ought to be in their flowering-pots, and the very largest specimens may be developed to a high degree of excellence in flower-pots not more than 8½ inches in diameter. Specimens are to be seen sometimes 2½ feet in circumference, the leaves and flowers fully developed. For ordinary purposes smaller plants are much better, and I cannot say that I ever had patience to train such plants, and place sticks to the flower-

trusses. A gardening friend who grew certain specimens to the size I have indicated, informed me that they could not get nearly all the sticks into the soil in the flower-pots, but had to tie some of them on to the stems, &c. One stick in the centre, and half-a-dozen more around it, are sufficient for ordinary decorative plants, and they will give better trusses than the old specimens which have been trained for ten or fifteen years. If the plants are kept near the roof-glass, and under suitable conditions as regards ventilating the house, watering the plants, &c., they will not be much troubled with aphid nor mildew, which will also appear in winter. Fumigate occasionally to destroy the aphid, and dust with flowers-of-sulphur for the mildew. Sometimes the plants are too much crowded with young growths, and in that case it is better to thin out the weakly ones, and tie out the others, forming a regular head of healthy growth. Watering should be done with caution; the plants should not have any until they are really dry, and enough should be given to saturate the entire mass of roots. They will not need it oftener than twice a week, and if the flower-pots are not well filled with roots, once in a week may be enough. The soil dries the most in very frosty weather, when much artificial heat is needed to keep up the temperature to about 40°, which is quite high enough in winter. "Spot" on the leaves is seldom seen when the plants are healthy to start with, and the cultural conditions are right; it is usually caused by over-watering with hard water, or by a low temperature and moist atmosphere, with perhaps insufficient ventilation in winter. *J. Douglas.*

TREE CARNATIONS.

An amateur fond of Carnations wrote to me recently, stating that his plants were much affected with a disease (?), which he cannot find alluded to in any way in the *Carnation Manual*. He says, the points of the leaves turn yellow, and the plants decline in vigour, especially in the early winter. He further adds, that it is not for want of air, as they have been in the open ground all the summer; nor is it because the plants are not near the glass, for the leaves almost touch it. Watering, he says, is carefully done, and the drainage is all right; and he adds, that the plants are not over-potted. And after much trouble taken to find out the cause, he has come to the conclusion that the potting-soil is not right, and he thinks it is owing to the use of leaf-mould. I mention this because two other good growers of Carnations have written me to the effect that they think leaf-mould is injurious to their plants. I do not think they are right in supposing leaf-mould made from the leaves of the Oak, Beech, Chestnut, Plane, Lime, Elm, Ash, or other forest trees to be injurious; but it is possible that the decayed leaves of some trees may be injurious to Carnations, or some deleterious substances may have been raked up with the leaves. Moreover, we know that fungoid growths of many kinds are formed in leaf-mould, the spores being introduced by decayed wood. We had some Carnations this year of the Souvenir de la Malmaison type, and a few of the leaves died off yellow at the tips; but I knew very well that this was owing to the plants being saturated with water. They had been placed in a frame which was flooded with water, so that the pots were standing in the water for twelve hours soon after the Carnations had been potted off, and I have no doubt but that the roots were killed in the greater numbers in some cases more than in others. The plants were put into a cold greenhouse, and with care they have come right again. I believe that in most cases this "yellow fever," as one amateur calls it, is caused by injudicious watering. When a Carnation has filled its pots with roots, it will take up a good deal of water, as well as weak liquid manure-water occasionally, especially when the pots are standing exposed out-of-doors and the weather is hot, but even under such conditions watering may be overdone, or the plants (some of them, at least) may be allowed to become very dry, in which event the rootlets perish. The plants are frequently and

heavily watered with the idea of getting them right again, and as the active rootlets are gone, the plants are unable to absorb so much moisture, and more rootlets get killed. One amateur writes to say that he cannot have over-repotted his plants, as some of them are quite healthy, while others in the same sized flower-pots have the leaves yellow. This is just what would happen if some of the plants had been too much watered after once being excessively dry. Another grave error is watering the plants immediately they are potted or repotted. I knew a gardener who, to save trouble, always watered his newly-repotted plants in the potting shed. As they were repotted, and the hand-barrow was loaded, they had a good watering through the rose of a water-pot, as he said, to settle the soil about their roots. Hardy, coarse-growing plants like zonal Pelargoniums, might not be injured by this way of treating them, but it will not do for Carnations. Let the soil be moderately moist when the plants have to be repotted, and the potting-soil itself should also be in a fairly moist condition; repot firmly, and do not give any water for three or four days after repotting, by which time the roots will be about to start in the new soil. Early in March, when we repot our exhibition Carnations and Picotees, we do not water the newly-repotted plants for two weeks or more, and even after that period has elapsed, it is necessary to be very careful that too much water is not applied, the new compost absorbing much water, but as it contains no roots, this does not evaporate very rapidly.

It is by attention to all these minute details of watering, draining the pots, and repotting the plants, that success is attained. We have scores of the Tree or Perpetual-flowering Carnations now in flower in our houses, and not one of them shows the least trace of disease of any kind, nor have I seen a single leaf turning of a yellow colour, except by the accident of too much water being applied, so that the roots were injured, and unable to perform their functions.

We began last season to put in cuttings, or "slips," of Tree Carnations before Christmas, and these early propagated plants were by far the best that we had, affording more and larger flowers. There is danger of these early plants being checked in their growth in the early weeks of the new year by being drawn up in hothouses, and they require a good deal of attention whilst striking them, and after they have been potted off singly into small pots. The small side-growths make the nicest cuttings, as these root more readily, and form plants sooner than do the harder thicker growths. I would also observe that I do not think it is necessary to use leaf-mould. A good compost for Tree Carnations is, three parts yellow loam, one of peat, one of decayed stable manure, a few crushed bones, and enough coarse white sand to keep the compost open.

The best scarlet or crimson variety we have at present is Winter Cheer, whose flowers are freely produced on dwarf plants. Mrs. Moore, a white, variety, flowers even more freely. These two are admirable examples of what a winter-flowering Carnation ought to be. *J. Douglas.*

BOOK NOTICE.

THE BOOK OF CHOICE FERNS. FOR THE GARDEN, CONSERVATORY, AND GREENHOUSE. By George Schneider. Parts 15 and 16. (L. Upcott Gill & Co., London.)

These parts of the cleverly-compiled and well-illustrated work on Ferns, which has on former occasions received favourable notice from us, show that the high standard of the book is well maintained, and the subject handled as well as possible, considering its multifarious bearings.

Part 15 has a good coloured plate, depicting *Trichomanes radicans* and *T. reniforme*, showing the extremes in variation in the genus. In the letter-press the genera *Menicium*, *Mobrie*, and the curious *Monogramme* are dealt with, and then follows that extensive genus *Nephrodium* in its four principal

groups, viz., *Eunephrodium*, *Lastrea*, *Pleocnemia* and *Sagenia*, and these run through the remainder of this Part and also the greater portion of Part 16, which finishes *Nephrolepis*, and commences the species *Nothochlæna*.

In the nomenclature the best authorities have been followed, but in order to make the vast amount of information contained in it readily available, a complete index, giving the name of each species as it appears in the book, and also under its most popular synonyms should be prepared on its completion; for as in the case of *Nephrodium* but few species are known under that name in gardens, the greater part being known simply under the sectional name *Lastrea*; and so also with most of the large species. One of the greatest difficulties in the way of the study of Ferns for gardeners, and amateurs at least, is the vast number of synonyms which nearly every species has, and if *The Book of Choice Ferns* can put right the tangled skein it will be doubly valuable. Doubtless, it is Mr. Schneider's intention to do his best in this particular as he has so cleverly managed all the other details.

THE WEEK'S WORK.

FRUITS UNDER GLASS.

By J. RIDDELL, Gardener, Castle Howard, York.

THE ORCHARD-HOUSE.—This structure should now be cleansed and put in order for the reception of the plants in pots at the beginning of the year. The strong and thorough measures recommended for the eradication of plant-pests in Peach-houses, when a removal of the trees and borders is being effected, are applicable to the orchard-house, inasmuch as success in hardy fruit culture under glass depends in a great measure on the trees being kept free from parasites, which prey on the foliage and young shoots. Should aphids, thrips, or red spider have been present during last summer, any or all of them, apply petroleum with a painter's brush of fair size to the wooden and iron parts of the building, working it well into every crevice. Remove the surface soil of the plunging bed to a depth of 3 or 4 inches, and replace with fresh materials from quarters likely to be free from troublesome insects. The plants may then be taken in hand and dealt with according to their needs; but in all cases affording them a dressing of a trusted insecticide, as Fir-tree oil. When the soil in the pots, especially that near the surface, has become more or less infertile by the repeated watering during the growing season, prick it out with a sharp stick down to the roots, and afford a layer of loamy soil to which a little finely-sifted old plaster, kainit, and basic slag have been added. If some of the fibrous roots have been laid bare, the compost should be worked in among them, and the pot filled up to within 2 inches of the rim, making the whole uniformly firm. Afford water rather sparingly till the growth of the plants shows that a more liberal supply will be of benefit. Trees which have the run of a border are generally more easily managed than the potted ones. Nevertheless, if any plant fails to bear a crop, rather strong growth follows, which rarely gets properly ripened unless some amount of root-pruning has been followed at the end of July or beginning of August. In cases where this timely check has not been given, a shortening of the main roots and any unduly long branches may now be done. There is, however, such a thing as overdoing both, and it is only when the pruning of root and branch results in a balance of the two—supply and demand—that good results follow. These plants, like those in pots, may receive any pruning necessary, such as the cutting out weak and sappy wood, and shortening of too long branches. The condition of the border will usually be indicated by the health of the plants, and should want of vigour show itself, remove some of the surface soil and replace it with a similar compost to that employed for the potted trees, with the addition of wood-ashes, potash, and phosphatic manure. Manures such as ammonia sulphate, or nitrate of soda (or potash), are best applied when the roots are active, especially nitrate, as they are so readily soluble, and are soon lost by drainage if the roots are not in a state to lay hold of them. As the house is kept cool and well aired, little water will be needed to keep the border in a moderately moist condition. No manure-water should be afforded the trees at this season.

THE ORCHID HOUSES.

By H. A. BURBERRY, Orchid Grower, Highbury, Birmingham.

THE INTERMEDIATE HOUSE.—Last week I omitted to mention in the list of flowering plants the pretty little *Masdevallia Tovarenis*, which certainly deserves notice for its usefulness as a flowering species at this season. Supposing a good batch of it is grown, the numerous white flowers which the plants produce make an effective show in the flower-house. It is a plant of easy culture, growing rapidly under ordinary care; sometimes, however, its bright green foliage will suddenly and unexpectedly fall off, which weakens and often ends in the loss of the plant. The leaves appear to do this without apparent cause, but it is generally attributed to a too low temperature, although extreme heat may just as reasonably be supposed to be the cause, or excessive drought, or the reverse. With moderate care, the species should grow well in this house. It is well, if it can be avoided, not to cut off the old flower-spikes of *Masdevallia Tovarenis*, as they will again flower another year, and often carry finer blooms than those of the first crop. With colder weather and the use of more fire-heat, due attention must be paid to plants which are known to become infested by thrips; such are *Odontoglossums*, which may be making growth. Dipping the plants is an effective remedy.

THE FLOWER GARDEN.

By H. W. WARD, Gardener, Longford Castle, Salisbury.

CLIMBING PLANTS.—The present is a suitable time in which to prune, clean, and re-arrange those climbing plants that may now stand in need of attention. Roses, Cotonæasters, *Pyraecantha*, *Ceanothus*, and such-like plants, should, when planted for covering walls, &c., have their shoots, in the first place, trained with regularity over the space allotted to them. The side-shoots of the Rose, some of the species and varieties of *Clematis* which flower on the current season's growth, and other deciduous climbing plants of the same mode of flower, should be pruned back to one bud every year, soon after the fall of the leaf, giving first attention to those which are placed on south and west aspects, and those on colder walls at a later period. Sometimes brown-scale will infest Roses, Cotonæasters, and *Cratægus pyracantha*, and the insects should be removed as far as possible with a piece of pointed stick, and afterwards well washed with warm water, to one gallon of which 6 oz. of soft-soap and a wine-glassful of petroleum are added; a stiff, clean painter's brush, or a bast-brush, are good for this purpose, the mixture being kept well-stirred whilst being used. This done, the branches may be re-arranged, and secured in their places.

BOX EDGINGS.—Although the planting of Box and other Evergreens may be performed at almost any time of the year, the period from October to March is the best; and bearing this in mind, gaps may be filled. To do this expeditiously and well, remove some of the gravel and the soil to the depth of about 6 inches. Make the soil at the edge which is to be mended level and very firm, and dibble or lay in, in a small trench having an upright face, rooted pieces of Box, in thickness and height equalling the rest of the line. Replace the soil, and then the gravel, treading both firmly. If much Box edging has become unsightly, it should be taken up and laid in, in a spot convenient for use, the ground on the lines dug, trodden, and levelled in accordance with the gradient of the walk, being careful that each side is made level with the other, and with the centre of the walk. Straight lines may be laid against a tightly-strained garden line kept in place with pegs, and curving lines must be properly struck, or patterns of wood laid down to guide the spademen who cut the trenches for the planters. The old edging is generally, if not grown too tall, fit for planting, but it should have long roots cut off, and be cut level at the top, and laid in about 2 inches in width. Proceed as in mending. In big jobs, it is prudent to entirely remove the gravel of narrow walks, and put it in the middle of wide ones.

EDGINGS WHERE THERE ARE SHADING TREES.—

It is labour lost to try to get turf to grow satisfactorily under umbrageous trees, especially as an edging to the walks, and the best plants for such places are dwarf *St. John's Wort* and *Ivy*. These plants should be, whilst kept from growing on the walls, allowed to extend freely over any bare spaces that may be within view from the walk. The present is a suitable time for planting the

above, which may be done by thrusting a spade into the ground, pressing it forward, and then drop a few pieces with roots into the opening thus made, withdrawing the spade, and trampling the soil about the plants.

JOB'S FOR WET OR FROSTY WEATHER.—A good stock of labels of various sizes, and pegs for marking out designs, &c., should be made; also Rose and Dahlia, and other flower-sticks.

PLANTS UNDER GLASS.

By R. MILNER, Gardener, Penrice Castle, Swansea.

THE FERNERY.—The present is a suitable time in which to repot Ferns in baskets; an excellent compost to employ consists of three parts fibry loam, one of peat, with the addition of a good portion of silver-sand, and some small clean bits of charcoal. The following are amongst the best Ferns for baskets:—*Goniophlebium subauriculatum*, *Woodwardia radicans*, *Davallia Mooreana* and *D. elegans*, and many of the varieties and species of *Adiantum*, which are amongst the most graceful of plants for a basket. The chief stock of Ferns and those growing on walls or on rockwork should be frequently examined, and decayed fronds removed by cutting them out carefully at the bottom of the stipes, one decayed frond left on a plant often communicating decay to others. Small fronds which have scale on them may be cleared of many of these injurious parasites by means of a pointed stick and an insecticide used in a weak state. The propagation of Ferns may begin forthwith by placing rooted portions of the root-stock under hand-lights in a warm house or hot-water pit. Care should be taken that specimen tree Ferns do not get too dry at the roots; also syringing or watering their stems every day.

COMPOSTS.—This is the season for getting in the required quantity of soil. Those who, like myself, have old pasture to go to will have little difficulty in obtaining fibry loam of rich quality; and this forms the basis of most of the composts the gardener uses. Residents in big towns are rarely so well situated, and must often find it difficult to get turf of the desired quality; and in this case it is a good plan to make a heap of turf, placing a layer of fresh horse-droppings between every second layer of turves during the progress of stacking it. Turf for potting should be cut from 2½ to 3 inches thick, 15 inches in length by 10 in width, and in fine weather stacked neatly, and with the top ridged to throw off the rain. Sufficient leaf-soil for the season should be got in, or be prepared by sifting old partially-decayed leaf-heaps, or got from a rookery, the quality of the latter is much superior to that which is obtained from leaves only which have been stored in heaps to rot. When storing leaf-mould, some of it should be placed in a dry shed for immediate use. Peat for various purposes should be purchased or dug, and stored like the loam, and that which is sufficiently decayed for present use brought under cover, or in some way protected from the weather. Orchid peat is rarely found on many estates, and the country gardener, like the dweller in town, must buy it of the soil dealer. He should see that it is very full of the roots of *Pteris aquilina*, and contains but little real soil or sand; and if for use at once, it should not be less than one-year cut, two is better. Peat for hard-wooded plants needs to be two-years cut and stacked, as the living fibres in it can afford no support to plants.

THE HARDY FRUIT GARDEN.

By H. MARKHAM, Gardener, Mereworth Castle, Maidstone.

RASPBERRY PLANTATIONS.—The Raspberry, although a surface-rooter, should be planted on deeply-dug land, and a new plantation should always be made at intervals of a few years, the fruit being much finer from young than old stools. On digging or trenching the land, break up, but do not raise the subsoil to the top. Heavy soils are the better for having incorporated with them, as the work of trenching proceeds, some lightening materials, as rough dung from the stables, rubbish heap-collectings, wood-ashes, road-scrappings, and spent Mushroom-beds. Planting may be done at any time during the winter, when the soil is moderately dry, and there is no frost to hurt the roots of the plants. Place the canes in groups of three, to form a clump, and at a distance of 5 feet apart; or, if the plants are to be trained to trellises, singly, at 9 to 15 inches apart. The canes should be left at full length till the buds begin to move in the spring, when they

should be cut down to within a few inches of the ground-level. Of fine varieties to grow, are—Baumforth's Seedling, a great bearer, of good quality, with large berries; Carter's Prolific [Carter's Semper Fidelis, for vinegar, or a sharp acid preserve. Ed.]; Red Antwerp, and Superlative, this latter being a robust grower, with fine, good-flavoured fruits. Belle de Fontenay for autumn, is a nice-bearing autumn variety, with large fruits; it fruits heavily, also, at the same time as the other varieties, if not cut down.

GOOSEBERRIES.—In mild weather when the pruning is finished, the soil should be raked from beneath the bushes and charred if the Gooseberry sawfly caterpillar was troublesome last summer, and the bushes afforded a thorough dusting over with soot and lime, which will tend to preserve the buds from sparrows and finches, and the branches from being covered with moss. Topdress the land with fresh soil, and mulch it with rotted manure, but do not dig deep in the alleys, but merely prick up the surface with a fork deep enough to bury the weeds and manure. Cuttings should be made firm in the soil, and others which may have been heeled in may be planted. Any pruning remaining to be done should be finished.

THE KITCHEN GARDEN.

By G. WYTHES, Gardener, Syon House, Brentford.

ASPARAGUS BEDS.—These beds should be given a portion of thoroughly decayed manure, placing about 3 inches on the surface, and cover the manure over with some of the soil out of the alleys, after which these also should be well manured, and roughly dug, leaving it in a rough state until early spring, when the beds may be lightly forked, and raked into the alleys, which should also be lightly forked, and made as neat as possible. Such culture for Asparagus at this season, however, should only be followed in well-drained or light soils, as on wet clayey soils the surface-dressing of manure keeps the bed in a wet cold state all the winter, and delays the crop. In such cases I would recommend a good dressing of manure as soon as the crop is cut in the early summer, and in dry seasons give ample supplies of liquid manure. Now is a good time to trench the ground for new beds, and I have found much can be done to promote the growth of this vegetable by incorporating various other soils with that of the staple in places where that is not suitable. In clayey soils there is no better material than road scrapings and the burnt refuse of the rubbish yard. Lime rubbish is excellent if mixed with such soils. Raised beds are most suitable in these cases, as they allow the excessive moisture to drain away. On light soils the addition of manure and heavier soils is an easy matter, so that I need not enter into details, but in all cases the preparation of the beds in the winter months is of great value, as it allows the materials to amalgamate, thus getting into good condition by planting or sowing time. In making new beds, cow manure is excellent on light soils, also a liberal dressing of sea-weed or fish manure.

ROOT-CROPS.—The ground for these should also be selected and prepared for sowing and planting. Deep cultivation and ample supplies of manures are the chief requirements. Those roots which grow coarse or which fork badly should be sown on ground that has been heavily manured for the preceding crop. Such roots as Beet, Parsnips, Carrots, and Salsafy require this ground; but, on the other hand, Cauliflowers, Cabbage, Brussels Sprouts, Sakale, Beans, and salads require abundant supplies of manure. For late Peas or Beans I prefer to place the manure in the trenches as advised for Celery. This is best done just before sowing the seed. Heavy land should be reserved for Broad Beans; and that which is light for Parsnips, Globe Artichokes, Marrows, and salads. Onions require more than ordinary care, so that good soil is necessary and an open sunny position for them—in many places the ground previously occupied by Celery is suitable. No time should be lost in clearing the surface, levelling and digging the soil and leaving it as rough as possible; this will then get in condition for early sowing. In soils badly infested with grub, I would advise a light dressing of gas-lime with a liberal quantity of soot spread over the surface before digging the ground. Wood-ashes are valuable, and should be forked into the soil just before the seed is sown.

GENERAL WORK.—All spare plots should be got in order by digging and manuring it re-

quired, and though I do not advise wheeling on or treading the ground in a wet state, every opportunity should be taken to get the work advanced. Get in the stock of Bean and Pea sticks required for the ensuing season, and prepare the same by sharpening and placing them in bundles according to their length, that they may be ready for use when required. Gravel for the walks may be procured, and placed in a convenient place ready for use as soon as the winter work is completed, as a slight covering of fresh gravel adds greatly to the neatness and effect of a well-kept garden. Large labels and stakes for vegetable quarters may be prepared in wet weather. Any draining required is better undertaken at this season, and any new walks made that are required.

THE APIARY.

By EXPERT.

DAMP QUILTS.—One of the greatest difficulties that beekeepers have to contend with at this time of year is damp quilts, with the attendant danger to the welfare of the inmates within the hives. Leaky roofs are frequently responsible for the mischief, but more often it is owing to some defect in the make of the upper part of the hive. If the air in the space above the quilts is allowed to be confined, condensation of moisture takes place, and they soon become damp, mouldy, and rotten. A current of air should always be ensured, for which purpose an opening at each end, at or near the apex of the roof, should be made about 2 inches in diameter. A piece of small-holed perforated zinc should be tacked over to keep out robber bees, spiders, mice, and other objectionable company; or, better still, perforated cones can be permanently fixed, so that the roof will then always be ready for use as a super clearer. It is a good plan to have the projecting eaves of hive roofs grooved about ¾ inch from the edge, as this prevents the drip from drawing under, and so into the hive. It is not of much use patching up cracks in roofs that let in the wet now, as this should have been done earlier in the year when the weather was favourable; so the better way perhaps will be to make use of some temporary covering until the spring comes round. Zinc, however, tacked on would effectively remedy such a defect, or Willesden card could be used for the same purpose. A little extra trouble in providing plenty of warm material above the frames and keeping it dry, will be well repaid in spring, when stocks so treated will come out stronger and better than those on which such attention has not been bestowed.

ON THE WEST AUSTRALIAN FAN PALM.

Baron von MUELLER, in the *Victorian Naturalist*, November, 1892, says:—"It has been known since the discovery of the Hammersley Ranges, fully thirty years ago, that a *Livistona* Palm occurs on the Mill Stream there, isolated from any other species of that genus; but incomplete specimens led to the surmise that this Palm might be identical with *Livistona Mariae*, a species restricted to the Palm Glen and several valleys of the Macdonnell Ranges in Central Australia. The last-mentioned Palm we know now through Mr. J. EDGAR, of the Rockhampton Botanic Garden, to be, while in a young state of cultivation, much more robust and upright in foliage than *L. australis*, besides the leaves at the early age of the plant being of a 'rich bronzy colour.' I have always found transmitted fruitlets considerably larger than those of the genuine *L. Mariae*, and further some minor differences exist also in the flowers of the two species, as recently ascertained. The West Australian Fan Palm has, therefore, now been named *L. Alfredi*, in honour of H.R.H. the Duke of EDINBURGH, at whose nuptial festival the Central Australian Palm was dedicated to the Princess MARIE of Russia. What applies to many other Palms holds good also for *L. Alfredi*, namely, that the leaves are more strongly spinous in the young than in the aged plant. Mr. BENEFORD records this Palm now also from the Fortescue River and its tributaries, from the sources of the Robe River, and from Cave's Creek."

SCOTTISH HORTICULTURAL SOCIETY.—In our report of the above, given on p. 712 in our last issue, the name of the lecturer on the "Dakeries," Mr. JOHN METBYEN, was omitted. The same gentleman has promised to give a lecture on "Notable Scottish Seats."

EDITORIAL NOTICES.

LETTERS FOR PUBLICATION.—All communications intended for publication, as well as specimens and plants for naming, should be addressed to the Editor, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

LOCAL NEWS.—Correspondents will greatly oblige by sending the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Advertisements should not be sent to the Editor, but to the Publisher.

APPOINTMENTS FOR THE ENSUING WEEK.

MEETING.

TUESDAY, DEC. 20 { Gardeners' Royal Benevolent Institution.

SALES.

MONDAY, DEC. 19 { Important Sale of the Blenheim Collection of Orchids, at Blenheim Palace Gardens, near Woodstock, by Protheroe & Morris (five days). Plants, Bulbs, and Chinese and Japanese Curios, at Protheroe & Morris' Rooms. Dutch Bulbs, at Stevens' Rooms.

TUESDAY, DEC. 20 { Orchids from Mr. F. Horsman, at Protheroe & Morris' Rooms.

WEDNESDAY, DEC. 21 { Liliom auratum, Dutch Bulbs, &c., at Protheroe and Morris' Rooms. Lilioms from Japan, at Stevens' Rooms.

THURSDAY, DEC. 22 { Plants, Lily of the Valley, Dutch Bulbs, &c., at Protheroe & Morris' Rooms. Shrubs, Roses, &c., at Stevens' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—39°.4.

Plant pests and Insecticides.

ONE of the most costly and unprofitable of all the operations in a garden up to less than a score of years ago, and one still too frequent, was the never-ending round of washing, scrubbing, and cleaning insect-infested plants. The costliness mainly arose from the high price of the "insecticides," or the inefficiency of those commonly employed, and the great amount of labour expended in applying them; and the unprofitableness, chiefly because of the severe treatment the plants received under the frequent scrubbing and rubbing to which they were subjected, and the general want of care and thoroughness in carrying out the cleaning process. More money was often spent in futile attempts to free plants from insect pests than would have bought clean, healthy stock of the same size in the open market. Unless the rarity or value of a plant will justify the cost of carefully cleaning it, when plants from any cause get into such a disreputable state of filth and insects, they should be promptly placed in the nearest furnace, and burned along with their dirt and vermin.

At the present time, when the depression in trade and rural affairs makes it a necessity in most gardens to keep down expenditure to the lowest limits consistent with efficiency, the strictest economy has to be practised in all departments. In few garden operations can more economy be generally carried out than in the timely prevention or arrest of insect and fungoid attacks. From want of forethought in applying simple and effective remedies, these pests are too often allowed to get a firm hold upon plants, and even permitted to overrun a house and sometimes a whole range of houses, before a serious thought is given to them, or a

finger lifted to repel their attack. By promptly applying a remedy, the outbreak might nevertheless have been stamped out in its infancy in a few minutes. Effective means and prompt action comprise the whole secret of success and economy in dealing with insect as well as fungoid pests.

It is now well-known to many gardeners, and should be known by all horticulturists, that petroleum is one of the best and cheapest of all insecticides; but its liability to abuse by the ignorant or careless makes the general use of it rather risky in unskilled hands, in which it is always dangerous, and sometimes deadly in its effect upon plants. To avoid this, the strength of the petroleum must be carefully reduced to the point at which it will kill the insects without injuring the plant on which they live. It is a curious but most important fact in Nature, that petroleum may be so graduated in strength that it will kill every insect it reaches which infests or preys upon plant life, without injury to the plant, or part of a plant, on which the insect lives. Thus, a very weak admixture of the oil applied to aphids—say green-fly on a Rose shoot, or any other tender young growth which aphides affect, will kill the fly, and not injure the growth. About $\frac{1}{2}$ gill of paraffin oil thoroughly blended with 1 gallon of soft water will destroy all aphides; but even half that quantity of paraffin in a gallon of liquid will do the same, if it is perfectly amalgamated with the water and properly applied in the form of spray. As a rule, red-spider and thrips do not appear on younger growth, although, if not prevented, they quickly overrun it. Older growth, such as fresh full-grown foliage of Vines, Peaches, and the like, are apt to be infested with them, and may be treated with $\frac{1}{2}$ gill of paraffin in the gallon of liquid without fear of injury to the growth, but with deadly consequence to the spider and thrips. For eradicating mealy-bug, scale, and similar pests, which chiefly infest the tough, leathery foliage, and firm woody parts of a host of stove and greenhouse plants, 1 gill of paraffin in the gallon of liquid may be safely employed, and if regularly and judiciously applied it will effectually keep them clear of every insect pest.

Among the various methods, most of which are failures, in vogue for reducing the strength of paraffin to make it safe for use as an insecticide, one of the safest and handiest is the method, now pretty well known among horticulturists, of boiling black soap and water, in the proportion of one of soap to eight of water, till the soap is wholly dissolved; and then, while the liquid is as near the boiling point as possible, pouring it into bottles, and at the same time adding the paraffin. The nearer the liquid is to the boiling point at the moment the paraffin is poured into it, the better will the whole amalgamate. A fixed quantity of the oil is put into each bottle, so that the exact strength is known. Corked, and set aside in a safe place, it is ready when required to be reduced to a proper strength for use. In preparing for application, it is simply poured into a pail, watering-can, or garden-engine, as may be required, and with soft water it is reduced to the desired strength. If, say, a bottle contains two gills of paraffin, it is enough for making four gallons of water sufficiently strong for spraying plants to clear them of aphides; or two gallons for clearing off red-spider and thrips; and one gallon for eradicating mealy-bug and scale insects. With a little practice, this simple and effective method of reducing the strength of paraffin may be safely performed by any intelligent person,

although entirely ignorant of chemistry. In these days, however, of evening classes and technical education, every young gardener ought to acquire a sufficient knowledge of chemistry to enable him to clearly understand the nature of the process by which paraffin amalgamates with water, when combined with black soap at a high temperature.

All liquid insecticides of a caustic nature are best applied in the form of spray, either through a garden engine, syringe, sprayer, or other similar appliance. One of the most effective of all the appliances for this purpose is the Stott spraying-nozzle, which can be screwed on to any form of sprayer, syringe, or garden engine, and which distributes the liquid evenly, safely, and economically, wherever it is required. In particular, paraffin, of whatever strength, as an insecticide, should always be applied in a spray, and never, if it possibly can be avoided, in any other way, because all dipping or washing of plants with it, is extremely liable to injure them. A slight film of paraffin may be floating on the surface of the most perfectly blended liquid, or some crude sediment may fall to the bottom, and in either case dipping or washing with it is dangerous, especially so to downy or hairy-leaved plants. Numerous mishaps of this kind have occurred which it is safe to say would never have happened if the insecticide had been applied in fine spray, even by the ordinary method of using the forefinger as a "sprayer" on the jet-nozzle of a common syringe. Still, a careless person with a jet-nozzle may easily play mischief, but with a "Stott" nozzle for spraying the liquid paraffin mixture, the risk of a mistake is rendered as near as possible an impossibility. Many plants, when in a dormant state, absorb this oil like a sponge! While, when growing, and full of sap, it cannot penetrate to the living parts, because the sap or moisture repels it. Hence Vines, and all such open, porous-wooded plants, are easily injured by paraffin, even of a weak strength, when dormant, while a much stronger solution may be safely applied to them when they are growing and full of sap. By bearing these simple facts in mind, any intelligent person may keep plants of all kinds free from insect pests at a minimum cost.

Fruits under many names.

THE foreigner is not the sole delinquent in the matter of selling well-known varieties of Apples and other kinds of fruit under new or little known names. Thus, a correspondent in *Möller's Gärtnerzeitung* informs its readers, who may be not well versed in fruit synonymy, that the new Eve Apple supplied by a Scotch firm is their old friend Manks' Codlin, which, it may here be stated, is found in Hogg's *Fruit Manual*, under the following names: Eve, Frith Pitcher, Irish Pitcher, Irish Codlin; and in Barnon's *English Apples*, besides these, are the names Belmont, English Pitcher, and Orme. It is known in Germany under the cognomen of Eve Apple of Scotland and Manks' Küchen Apfel. In France, M. LEROY says that it is known as Pomme d'Eve, Doux d'Argent (Suisen Nanzhäuser), Mirabelle (Thau Apfel), Manks' Codlin, and Margnerite, the double names adding to the confusion and deception. The Americans grow it under the following names: Old English Cooking Apple, Downing, and Frith Pitcher.

The writer of the article here quoted from, gives a few more examples of the manner in which his countrymen are induced to purchase well-known kinds of fruit: of Apples, Charlamovsky (Boravitzky) reaches them under the name of Duchess of Oldenburgh; of Pears,

Williams' Bon Chrétien comes from America as The Bartlett; Esperens Herren Birne comes from France as Beurré Lucrative; Marie Louise as Marie Louise Delcourt, and several more, including the Old Windsor, under the name of Beurré Montecat.

It would not be any wonder, he thinks, if the old Gelben Bellefleur were received from England under the name of Mrs. Barron—a name, by the way, under which it was described in the *Florist and Pomologist*,

of catalogues in these islands and in America, France, and Germany would attach to the best known name in their country, of the varieties, the names under which they are commonly known in each of the other countries, much of the probably unintentional deception of customers would terminate, and the cost of the extra printing involved by this improvement would be very well covered by discarding the many worthless varieties that now find a place in most lists of fruits,

"The gardeners of Kew, past and present, are desirous of forming themselves into a guild, and propose to publish annually a journal, in which will be recorded (1) the present Kew staff, from the Director to the gardeners; (2) a list of all old Kewites, with the date of their leaving Kew, and their positions and addresses; (3) brief notices of distinguished past Kewites; (4) Kew notes; (5) interesting correspondence from old Kewites; (6) the proceedings of the Mutual Improvement Society, and the prize essays of the year; (7) the proceedings of the British Botany Club; (8) the report of

FIG. 112.—VIEW OF CREWE HALL. (SEE P. 740.)

The evils of the plurality of names are greater and much further-reaching in their effects commercially when applied to fruits than is the case when decorative garden plants, or plants of merely botanical interest, are concerned. Imagine, for example, the chagrin of a fruit cultivator on a large scale who already had numerous trees of those few sorts that are mentioned above, on finding his trees after years of waiting to find that he already possessed them under another name. Would he not be justified in applying hard names to the sellers? If makers

OUR ALMANAC.—Secretaries of societies and others are earnestly requested to forward immediately, the dates of show-fixtures, and meetings of horticultural societies of any kind for 1893, for insertion in the Almanack to be published in our issue for January 7.

GUILD OF KEW GARDENERS.—Recognising, the imperative necessity of some organisation for gardeners, in order that they may obtain the social position and emoluments to which their qualifications entitle them, we welcome the formation of an association which goes some way towards the realising of what has long been an ideal of ours,

the Cricket Club. Frontispiece: portrait of a distinguished Kewite. The journal will consist of about fifty pages, royal 8vo, to cover the cost of which, with postage, an annual subscription of one shilling will be necessary. It will be published on May 1. Will all old Kewites, i.e., men who have at any time worked as gardeners at Kew, kindly send their names, date of leaving Kew, with present position and address, to the Secretary, for publication in the journal? It is anticipated that every Kewite will gladly become a subscribing member of the guild, and also communicate any interesting professional information for publication in the journal. It will be seen that the aim and object of

the guild is the very laudable one of uniting all Kew men in a bond of fellowship by means of a journal which will convey to them news of interest, and enable them to communicate with each other. There are probably 500 Kewites distributed all over the world, but of the whereabouts of all except a small proportion, there is at present no record. The committee to carry out this scheme is composed of Messrs. W. WATSON, W. J. BEAN, G. H. KRUMDIEGEL, J. BROWNE, H. PETTIGREW, and J. AIKMAN. All communications should be addressed to the Secretary, J. AIKMAN, Whitestile Road, Brentford. It would save correspondence if members would enclose their subscriptions when they write to the Secretary."

"THE ORCHID REVIEW."—On January 1, 1893, will be published the first number of an illustrated monthly journal, devoted exclusively to orchidology in all its branches, edited by R. A. ROLFE and FRANK LESLIE. Price 1s. monthly; post free, 12s. per annum, payable in advance. The work will be specially devoted to the interests of cultivators of Orchids, and will be conducted on broad and independent lines, as a general repertorium of information on every branch of Orchid lore. It will be printed in clear type and on good paper, and of 8vo size. Among the subjects treated of will be found:—Descriptions of new species and hybrids, with their origin and parentage; notices of interesting collections; portraits of interesting Orchids; cultural notes by experienced cultivators, with a comprehensive Calendar of Operations; geographical notes, and sketches of Orchids at home; biographical sketches; reports of meetings, and doings of the month generally; with any other matters likely to prove useful or interesting to lovers of Orchids. It is intended to make the illustrations a feature of the work. They will be executed and reproduced by photographic process, in order to ensure accuracy and highly-finished results.

BARON SCHRÖDER.—The QUEEN, it is officially announced, has directed Letters Patent to be passed under the Great Seal of the United Kingdom of Great Britain and Ireland, granting the dignity of a Baronet of the said United Kingdom unto JOHN HENRY WILLIAM SCHRÖDER, of The Dell, in the parish of Old Windsor, in the county of Berks, Esq., and the heirs male of his body lawfully begotten.

OPEN SPACES.—At the monthly meeting of the Metropolitan Public Gardens Association, 83, Lancaster Gate, W., Sir WILLIAM VINCENT, Bart., Vice-Chairman, presiding, it was announced that Her Royal Highness, the Princess LOUISE had been pleased to send a contribution of £10 towards the general expenses. It was stated that funds were needed for the acquisition of the Cross Bones disused burial-ground, Red Cross Street, S.E., which the owners now seemed willing to sell; and for the laying-out of Woolwich Churchyard, S.E., the estimate produced showing that the cost would be about £1100. It was agreed to offer seats for Maida Vale, N.W.; to lay out a portion of St. John's churchyard, Stratford, E., at a cost of £300, if money for the payment of wages, about half the estimated cost, was locally provided; and to make a grant for tree planting in thoroughfares in St. Luke's, E.C. A letter was read from a member generously offering a sum of £5000 for the laying-out and permanent maintenance of Soho Square, W., as a public garden if transferred to the local authority, which offer the Association had placed before the committee of management, who had it under consideration. It was reported that the Association had during the month taken part in a deputation to the City corporation, soliciting a grant of £3000, being the balance required to complete the £75,000 needed for the purchase of Hackney Marshes, E., 340 acres in extent, a scheme set on foot by the Association early in 1890. The secretary stated that the London County Council had to purchase 41 acres of the Millly Fields, S.E., for £40,350, upon the joint-committee of the Open Space Societies and residents banding over the money they had collected, amounting, with the £7000 subscribed by the Greenwich District Board,

to over £17,000; and that £700 was urgently needed before the 21st inst., the last day for depositing the Bill, for the purchase of the Paddington recreation-ground, at a cost of £50,000. A donation was received from a member for tree-planting in Pancras Square, N.W.; and the Hackney District Board agreed to pay half the cost of similar work at Stamford Hill, N. Another member, Lord St. Germans, kindly expressed his willingness to transfer his rights over Kildrooke Green, S.E., to the London County Council, which would ensure its preservation as an open space.

STOCK-TAKING: NOVEMBER.—Whilst so much is being said and published respecting the unemployed—it is the season of the year—one takes up the Board of Trade Returns with a little trepidation, somewhat allayed on making the pleasing discovery that the exports for the past month show a deficit of less than a quarter of a million, as compared with the same month last year. True, the imports show a great falling off, but this is in value, and the largest reductions are in the values of food supplied, and in raw materials used in textile manufactures. As all the world knows—more especially that section of it producing the food and the raw materials—prices have gone down very considerably; our own agriculturists know this fact, and are to-day carefully scanning the position with a view to legislation. It is useless to deny that there is a slackness in general trades, but not to the enormous extent some folks would have us believe, in the face of the value of British and Irish manufactures exported. The following figures are from the "summary" table of the returns for November:—

IMPORTS.	1891.	1892.	Difference.
	£.	£.	£.
Total value for month	£13,861,389	£38,898,373	-4,963,016
§II.—(A.) Articles of food and drink—duty free ...	15,392,755	13,058,620	-2,244,135
(B.)—do., dutiable	2,619,209	2,838,758	+199,549
§VI.—Raw materials for textile manufactures (including Flax, Hemp, and Jute)...	10,968,561	8,913,754	-2,054,810
§VII.—Raw materials for sundry industries and manufactures (including wood and timber, hewn, sawn, split, dressed; vegetable materials, for paper-making, &c.)	3,484,450	3,505,244	+20,794
§IX.—Miscellaneous articles (including Clover, Grass, Flax, Rape, Linseed) ...	1,944,693	1,621,563	-323,130
(B.)—Parcel Post ...	39,214	28,983	-10,231

In the following little table some of the figures are well worth consideration, especially those showing increase. Oranges and Lemons are given this month, as the season of greatest consumption is close at hand. The figures relate to the past month and the same period in 1891:—

IMPORTS.	1891.	1892.	Difference.
Fruits, raw:—			
Apples ... bush.	950,011	901,959	-48,052
Cherries
Oranges and Lemons ..	179,676	675,974	+496,308
Pears	19,268	+19,268
Grapes	99,012	+99,012
Unenumerated, ..	134,762	29,584	-105,178
Onions	581,003	448,711	-132,292
Potatoes ... cwt.	79,032	493,105	+324,071
Vegetables, unenumerated, raw, ... value	£55,896	£52,912	-£2,984

It may be interesting to note here, that the various fruits imported from California last season footed up the respectable total of 210 tons, two-thirds of which (160 tons) consisted solely of Pears. The capacity of this country for fruit grows day by day. "Good Tomatoes," said a dealer the other day, "will sell here to any extent," and so we are glad to note a promise, held out by growers at the Cape, of a

supply during the coming season. What the amount to be put on the market may be we know not; if the quality be good, certainly there will be few left unsold. Some months since we referred to the high price of vegetables in the Transvaal; there are some difficulties in growing these in that locality. Mr. FORD, formerly H.M.'s Attorney-General at the Cape, who figured in the Boer War, and has done much for the development of mining at Kimberley and Johannesburg, informed the writer a short time since of his experiences in vegetable growing. He desired to have some out-door employment and succulent green stuff, so made himself a nice little garden. But one fine day a cloud appeared in the sky, travelling rapidly in the direction of his home-stead. Down came the hail, of Hazel-nut size; and when it had vanished, it was discovered that the garden had kept it company. Whilst noting things in that part of the globe, it may be interesting to some to learn that tobacco in Natal promises to be a success. Some Havana seed was sent from home, and present appearance of the plant promise well for coming harvests. Still further to the East, and we learn from Simla of recent date that the Indian Government have determined to encourage the growth in that neighbourhood of English fruits, and have agreed to expend Rs. 2000 annually for seven years for that purpose. Carefully expended, we have no doubt conclusive results will be obtained. In the matter of—

EXPORTS.

there is little to add to what has been noted above. The figures for the month are £18,549,340, against £18,790,949 for November, 1891, or a decrease of £241,609. The exports of British and colonial merchandise show an increase for the month past of £410,796. If the iron industry in this country leaves much to be desired, it is but a poor satisfaction to know that we are very far from being in an isolated position; but we are looking forward to better times, after the rest of Christmas and New Year's holidays.

ROYAL BOTANICAL SOCIETY OF BELGIUM.—M. EM. RODIGAS, the Director of the National School of Horticulture of Ghent, has been elected President of the Society. In view of the forthcoming Quinquennial at Ghent, this appointment is specially significant.

THE LORD LIEUTENANT OF IRELAND.—The Lord Lieutenant of Ireland (*vide Daily Graphic*) was on Friday, December 9, presented with an address by the members of the Royal Horticultural Society of Ireland. In reply, his Excellency said the study and practice of horticulture would lead to the promotion of an industry which would be of great importance to the country.

THE NATIONAL ROSE SOCIETY.—The annual meeting of this Society was held in the rooms of the Horticultural Club on Tuesday last, under the Presidency of the Rev. W. WILKS. The Treasurer announced his intention to resign, one reason for the step being the backwardness of the members in forwarding their subscriptions, and the great and quite unnecessary trouble and expense thus given to the executive. Ultimately, Mr. HAYWOOD was induced to withdraw his resignation, and to continue for another year, his further retention of office being made conditional on the better behaviour of the rosarians, or at least of a section of them. An animated discussion arose as to the date on which the metropolitan show should be held, Rev. J. H. PEMBERTON arguing at great length in favour of a later date being fixed. He was supported by other speakers, and the ultimate result was that Mr. PEMBERTON'S proposal was lost by a small number, and the metropolitan show will be held at the Crystal Palace on Saturday, July 1. Mr. PEMBERTON then proposed that the affairs of the society be managed by a committee of forty, to be annually elected by ballot. This was carried. A proposal to allow voting by proxy was lost. The new rule requiring amateurs to show according to the number of exhibi-

bition varieties grown by them was stated to have worked very well. The provincial show of the society will be held at Worksop on July 13. The financial condition of the society is so far satisfactory, the balance at the bankers over disbursement (£687 11s. 4d.), amounting to £31 16s. 7d.

THE NURSERY AND SEED TRADE ASSOCIATION, LIMITED.—On Friday, the 9th inst., the annual dinner of this Association was held at the Guildhall Tavern, Gresham Street. The President (N. N. SHERWOOD, Esq.), presided, and was supported on the right by Mr. H. J. VEITCH and Mr. H. TURNER, and on the left by Mr. R. CATHERALL, of Kirkham, Lancashire. The vice-chair was taken by the Treasurer, Mr. W. J. NUTTING. The Chairman in proposing the toast of the Association, said

might be expected to be in town. Mr. H. J. VEITCH, whose name had been coupled with the above toast, said that he was sorry to have taken the place that ought to have been given to Mr. W. PAUL, to whose efforts the success in starting the association was very largely due. Mr. VEITCH, however, would not yield to any person in the desire he had for the welfare of the society, and spoke as to the good which it had already done. Since 1885 the society had succeeded in collecting £22,516, which it had undertaken after the various nurserymen and others had failed to get it in. The general meeting, which had usually been held previous to the dinner, had been postponed until January 11, 1893, at 6 o'clock, when the report (which, through unavoidable reasons, was not fully prepared for the afternoon meeting), would be presented. Mr. W. PAUL, in proposing the

EARLY FLOWERS.—A correspondent, writing from Herne Hill, says that spring flowers blooming in his garden on December 10, were Primroses, Daisies, and Pansies.

DECEMBER HORTICULTURAL MEETING AT GHENT.—Certificates of Merit were awarded to the following plants:—1st, *Odontoglossum crispum guttatum* to M. J. Hye—a fine example, bearing thirty fine flowers evenly marked with dark, nearly black spots. 2nd (*à l'unanimité*), *Kentia Forsteriana aurea*, to M. Petrick; this plant has leaves and petioles of a bright orange-yellow, distinguishing it from all other Palms. 3rd, *Cypripedium Charles Canham*, to M. J. Hye; with flowers of unusual size, the lip claret-coloured, over 4 inches long, as is the dorsal sepal, thus the complete flower is about 8 inches across. Besides the expanded blossom, the specimen bore eight buds, being a very strong plant. 4th, *Odontoglossum crispum* var. to the same; noticeable for the numerous and irregular red markings with which the pure white flower is variegated. 5th, *Dendrobium Phalenopsis* var. *Schroderianum*, to M. Desmet-Duviver, shown for the first time; the dark red flowers render it superior to the type. 6th, A lot of six *Cypripedium Alberti*, to M. Jules Hye; this fine hybrid was described in the *Gardeners' Chronicle* for December 2. 7th, *Cypripedium radiosum*, a new hybrid, from the same, raised from *Spicerianum*, the dorsal sepal is very large and freely flushed with rosy-lilac. Certificates of merit were allotted for:—1st, *Vriesia aurora major*, to M. Robert Grenier, a fine spike of very bright orange-red, with remarkable habit and foliage, the leaves of glossy green are arranged in a rosette—the plant is a hybrid between *V. Warmingi* and *V. psittacina*. 2nd, *V. multicaulis*, still more bright in colour than the former, but of inferior habit and foliage; also from M. R. Grenier. 3rd, *Cineraria maritima aureo* var., from M. Fr. Desbois, leaves evenly edged with golden yellow—a promising plant for massing; 4th, *Zygotetulum Burkei*, to M. A. Van Imshoot, a rare but not very showy variety; 5th, *Oncidium Phalenopsis* var., to the same (*par rappel*); 6th, *Dendrobium Cassiope*, also to the same—a very interesting hybrid from *D. japonicum* and *D. nobile*; 7th, *Cypripedium Gabrielle Moens*, to M. J. Moens—a very distinct hybrid from *C. Spicerianum*; 7th, *C. Chamberlainianum*; 8th, *Odontoglossum crispum* var. *myriostigmum*, the white flower covered with many small brown specks. Honourable mentions to:—*Lastræa lepida* (for culture), to MM. Duriez Frères; *Aralia gracillima* (for its flowers), to M. B. Spæ; *Cypripedium Arthurianum*, to M. J. Hye; *Dendrobium formosum giganteum* and *Odontoglossum* spec., with a fine truss of sulphur-coloured flowers spotted with black. A Botanical Certificate to *Amblostoma tridactylon*, from M. A. Van Imshoot, a very curious Orchid in appearance, rather suggestive of *Pilea calitrichioides*. *Ch. De B.*

FIG. 113.—AZALEA INDICA IMBRICATA: DOUBLE-FLOWERED. (SEE P. 741.)

that during the year they had lost many members through death and other causes, but that the additions they had made were just a little in excess of that number. Still, the Association was not progressing at the rate it might be expected to do, and he urged all who believed the objects of the Society were good to do their utmost by personal persuasion to enlarge the circle of members, and thus increase the influence of the Society. The Society was the means of establishing unity among the members of the trade, of disseminating information connected thereto to the members, and of collecting debts, &c., that individuals members were unable to obtain in the usual way. The Chairman laid great stress on the benefits that ought to result to the trade through the members meeting together and exchanging views and ideas, suggesting that to this end it might be desirable to fix the date of their annual dinner upon some day, when, through sales, or other business, many provincial nurserymen

toast of the trustees, said that a very satisfactory point was, that when the balance-sheet for the year was completed, the Society would have £100 in the bank. Mr. PAUL thought that the commercial aspect of horticulture had not been looked after quite so much as that of the artistic and scientific aspect, and such attention as it required could only be obtained from such an Association as this. Mr. CATHERALL, of Lancashire, in replying for the visitors, was able to say that Lancashire had not shared fully in the depression other counties had experienced in agriculture; and horticulture, he was glad to say, was progressing in that district. Referring to the depression that existed in agriculture, he advised friends of agriculture and of horticulture not to waste their energy in seeking to benefit these trades by means which it was apparent to all, are impossible to be obtained. He heartily accepted an invitation to become a member of the association.

"THE HORTICULTURAL DIRECTORY."—This indispensable little book appears upon our table in its 34th annual issue. It is full of information likely to be required by gardeners, and may be had for a shilling at 171, Fleet Street. It is not usual to comment on advertisements, but knowing how difficult it was at one time to procure London Purple or Paris Green for spraying purposes, we are glad to see at last an advertisement showing where it may be procured. It is of no use for the press to recommend articles for trial or general use, unless they are in a position also to say where the articles may be obtained. When we were recording the spraying experiments made with so much success in America, and advocating their repetition here we had to send to America for the article, which, as it turned out, was manufactured here! Many correspondents applied for information which we could not give.

COUNTY COUNCILS AND EXPERIMENT STATIONS.—Mr. ROBERT WARINGTON contributes to the Record of technical and secondary education, a paper descriptive of the agricultural experiment stations in the United States. There are fifty-four of them

[to our one or two!] each under the direction of a staff comprising some or all of the following officials: an agriculturist, a chemist, a botanist, a horticulturist, an entomologist, a bacteriologist, a veterinarian, and a meteorologist. Mr. WARINGTON, who writes from personal experience of some of these institutions, describes the kind of work done, the lectures given, the experiments carried out. We need not enter into detail on these matters, as our columns contain frequent extracts from the Bulletins of the several stations, so that we can cordially agree with Mr. WARINGTON'S concluding sentence—"May we not hope that our own county councils will realise the immense importance to the country of an improvement in agricultural practice, and by carrying out schemes of agricultural [and horticultural] instruction and investigation, fulfil in England the duties so energetically undertaken by the various States in America?"

DISAPPEARANCE OF DESERT PLANTS FROM EGYPT.—This is attributed by Mr. FLOYER, in the *Kew Bulletin*, to the camel, whose necessities entail the destruction of a large amount of herbage. Some system of conservancy, therefore, is indicated.

THE TAJ GARDENS, AGRA.—These were described lately by Mr. J. H. VEITCH in our columns. The last number of the *Kew Bulletin* contains a note on the subject of the future management of the gardens, by Mr. WESTLAND, an old Kew man, who has rendered good service in Hong Kong.

THE GOLD COAST BOTANICAL STATION.—The last number of the *Kew Bulletin* contains a report by Mr. CROWTHER on the prospects and condition of the botanical station. Sixteen acres of "bush" were cleared, Potatoes planted, as well as Cocoa-nut Palms, Cacao, Bananas, Liberian Coffee, Oranges, and other useful plants. The record affords testimony to the energy and activity of Mr. CROWTHER.

MAROGOGEPIC (COFFEA SP.)—This superior Brazilian Coffee, a plant of which was introduced by the Acclimatisation Society of Queensland four years ago, continues to thrive admirably, and is at present showing signs of an excellent crop. The plant is now 9 feet high, with a spread of 6 feet 6 inches of the lower branches; in habit it much resembles the Liberian Coffee, the foliage being much larger than the Arabian sort. Last year's crop of berries was all sown, and about a dozen and a half of plants will be available for distribution in the spring. About 300 berries are already set on the plant, and about a similar number are in younger stages of development. Six grafted plants were sent out last year, but up to the present no returns have come to hand as to the success attending their growth. In good soil this Coffee should produce good results. The ground at Bowen Park, although rich, is not of sufficient depth to fairly test the plant's capabilities; but it is hoped that with some of the young plants being at present raised, experiments in more favoured soils and situations will prove this new Coffee to be a most profitable cropper.

"INSECT LIFE."—The last issued part (November) is chiefly devoted to the proceedings at the fourth annual meeting of the Association of Economic Entomologists at Rochester (N.Y.), in August last. The contents are very varied, and form an interesting testimony to the amount of useful work done by the State entomologists and others. It is not pleasant reading, however, to see how much more energetic our American cousins are than we in all matters relating to the application of science to practical art.

A DOUBLE CALOCHORTUS.—We do not admire double flowers for their beauty, but for their interest and durability. Others prefer double to single flowers, and these will be interested in learning that a double form has been found in California. *Triteleia*

is also noted as having been found with double flowers in San Francisco, according to a writer in Professor L. GREENE'S journal, *Pittonia*.

L'ILLUSTRATION HORTICOLE for November 15 gives the following particulars concerning the consumption of Oranges in England; the figures quoted are astonishingly large:—"In Italy, there are 5,400,000 Orange trees, which yield an annual harvest of 1,600,000,000 Oranges, that is to say, an average of 300 Oranges per tree. In Seville, the province which furnishes the most in Spain, each tree bears on an average 6000 Oranges. From St. Michael, in the Azores, from an area of 210,000 acres only, there are sent annually to England 250,000,000 Oranges, valued at £300,000. Spain sends to all countries about 1,000,000,000; Italy rivals Spain with a like number; Greece exports only 100,000,000, and the Azores about 400,000,000. It is calculated that in England, after their importation, each inhabitant spends 1s. a year on Oranges; or, remembering that the fruit is resold at retail prices, it would be more accurate to reckon the cost at nearly 2s. per person."

KENT COUNTY COUNCIL EXPERIMENTS COMMITTEE.—The committee held their fourteenth meeting last Thursday, at the Horticultural College, Swanley. After the minutes had been read and confirmed, Professor CRESHIRE gave an address showing how a grower not possessing a knowledge of chemistry could ascertain what manure a soil requires. The substance of the Professor's remarks were identical with those which he made at Beckenham on November 22, which we published last week, p. 706. A discussion followed on soot, kainit, and basic phosphate. It was decided that the committee should not meet again until after Christmas.

WILD FLOWERS AT AN AUSTRALIAN FLOWER SHOW.—A show of wild flowers, says the *Daily News* of December 5, was held in Perth Town-hall, Australia, last month, when the summer blossoms were in full variety. It was the first exhibition of the kind ever held in Western Australia, and the display is described as "dazzlingly beautiful," the number and variety of bouquets and table decorations being very great. The show was opened by the Governor, Sir Wm. Robinson. This is a step which we have frequently urged on our colonial friends. Why should they go out of their way to grow *Chrysanthemums* when they have such riches at their doors.

THE BLENHEIM ORCHIDS.—More than 1900 lots, including many specimen plants, will be offered for sale by Messrs. PROTHROE & MORRIS, on Monday next, and four following days, at noon. The sale will take place in Blenheim Palace Gardens, near Woodstock. A special train to Woodstock will be run in connection with the train from Paddington at 9.50 A.M., and from Birmingham, G.W., at 9.25 A.M. A train leaving Worcester at 9.10 will be stopped at Handboro' on the first three mornings of the sale. All the stations are within 2 miles of the gardens.

ROYAL AGRICULTURAL BENEVOLENT INSTITUTION.—Mr. B. STRETTON, of Wisboro' Tower, Billingshurst, Sussex, has forwarded to the Secretary of the above Institution, 26, Charles Street, St. James's, the handsome donation of £1000. In accordance with the wish of the donor, the Council have resolved not to invest this sum, but to spend it in providing additional pensions for ruined farmers and their wives and widows.

GOVERNMENT PLANTING IN IRELAND.—We learn that large orders for trees have been sent to Messrs. DICKSONS (Chester) by the Irish Land Commissioners, for planting on the west coast of Ireland.

THE SURVEYORS' INSTITUTION.—At the ordinary general meeting, held at 12, Great George Street, Westminster, the President, Mr. C. J.

SHOPIE in the chair, a paper was read by Mr. J. DOUGLAS WALKER, Q.C. (Associate), entitled "Rights of Way." A discussion followed and was concluded, and a vote of thanks was unanimously passed to Mr. WALKER for his paper. The next ordinary general meeting will be held on Monday, December 19, when a paper will be read by Mr. E. TIDMAN (Fellow), entitled "Sanitary Ventilation." The chair to be taken at 8 o'clock.

CREWE HALL.

CREWE HALL, Fig. 112, p. 737, in one sense, suggests Enville. Both places are very close to unlovely towns, and yet show beautiful sylvan scenery. Crewe Town, which has become thickly populated in almost an American short time, consists of long narrow streets of ugly red-brick houses, all of the same pattern, and over it ever hangs the smoke from the railway factories, making the air murky and muggy. It is an agreeable surprise, therefore, to enter into the country, as it were, at the park gates, which are on the outskirts of the town. A drive of nearly two miles leads up to the mansion, which is Tudor in architecture. The family name, appropriately enough, is also Crewe, and several of the name have played an important part in history. In the time of the Stuarts two of the Crewes seem to have been of quite different temperament. Lord Chief Justice Crewe succeeded Sir Edward Coke, and, like his great predecessor, was dismissed from office for denying the legality of Charles I.'s forced loans. Nathaniel Crewe, Bishop of Durham, however, said "that he could not live outside the King's smile," and was the only important bishop who supported James II. in his measures for the advancement of Roman Catholicism. Macaulay pours out the vials of his wrath on him. In later history they have always been known as staunch Whigs. The original Hall was built in 1636; it was burnt down in 1866, and was restored under the direction of E. H. Barry.

The north front, Fig. 112, p. 737, rather curiously, is the most elaborately laid out, and it is in Nesfield's best style. Under the windows is a terrace-walk with a balustraded wall. From this a broad flight of steps, with two stone lions on either hand, leads down to a rectangular lawn, with flower-beds in the centre, and clipped trees round the edge. Another flight of steps descends to a broad walk, extending downwards for a considerable distance, with flower-beds on both sides. The beds here are mostly circular, and were very bright and varied in colour, and some semi-tropical plants added much to the enlivening effect. But the flower-bedding, well done as it was, was only a minor factor in the landscape. For from the very start the beautiful natural curving of the outline of the lake, gleaming in the dip below, had been in full view. The opposite side of the lake is wooded with openings in places; to the right there is a pretty verdurous island, beyond which the park of 600 acres undulates away into the far distance. Thus in this flower garden one can stand amidst pretty surroundings, and gaze long and lovingly on a beautiful natural scene. The walk round the lake, too, is very well worth taking. In the twilight, often in the hush of Nature, there is an absolute stillness of the water very provocative of romantic dreams and fancies. That the Crewe family have felt this charm is proved by a temple in a grove of trees being called the "Temple of Peace."

The balustraded terrace-walk is continued round to the east side, and steps descend, as before, to another smaller flower garden, which serves as a base to a long *Araucaria* avenue. Between every two trees are circular beds, mostly filled with Dahlias, single and double. At the end of this avenue, turning to the right, one comes to what are called in Scotland "the policies," i.e., walks through a lawn, on which are growing Conifers and clumps of shrubs. The most notable Conifers are perhaps *Picea grandis* and *Picea concolor* violacea, both of which promise to make fine specimens. Some high Scotch Firs gave an air of dignity to all the other trees near them, and a young Oak avenue will be in time

a great feature. A large old-fashioned rosery, which one traverses on returning to the house, is suggestive of the place before Nesfield transformed it.

On the south front is the main approach, the carriage-drive circling round a lawn, on which there is another flower garden. On the west side, high trees come up to the house, through which a road leads to the kitchen garden; and here I cannot refrain from writing in the first person, in order to say that I have seldom, if ever, enjoyed a stroll through glass-houses as I did under Mr. Whitaker's guidance. His wide knowledge of plants, and his evident fondness for everything under his charge, made me realise how he had grown to a Gladstonian old age in his master's service. As he said himself, "Lord Crewe and I have grown old together."

The houses for fruit growing are very numerous, and well-managed. One house for Peaches might be copied with advantage elsewhere. The front lights are at a far greater distance from the back-

leaved Ouvirandra; and a frame behind a north wall was filled with choice Ferns, such as Todeas and the Killarney Fern.

The surroundings of the kitchen garden are quite unique. What used to be an old drying ground has been turned into one of the prettiest parts of the ground. Between two high Yew hedges, planted by Mr. Whitaker himself twenty-five years ago, is a well-kept lawn and three conservatories in a line with flower-beds in front of them. These conservatories are very artistically designed, the middle one being dome-shaped, and each one of them is kept at a different temperature. The first we entered was the highest in temperature—as high as a stove. A good many Orchids were cultivated in this house, including good specimens of *Vanda teres*, *Dendrobium Dearei*, the sensational *D. Phalaenopsis*, and *Cattleya citrina* violacea. The conservatory in the middle was intermediate in temperature, and a very fine effect was made by a different creeper

with pyramidal fruit trees, and in the other with Irish Yews, *Cupressus Lawsoniana*, *Thuia Lobbi*, *Thuipopsis dolabrata*, &c. No visitor should omit to follow this walk round, for at the turn it is lined with Cedars of Lebanon, and then passes for a long distance into the shade of "immemorial Elms." *Vagabond.*

RHODODENDRONS.*

(Continued from p. 698.)

CHINESE SPECIES.

The two best known Rhododendrons from China are the hardy deciduous-leaved *R. sinense*, commonly called *Azalea mollis*, and the Indian *Azalea*, which, notwithstanding its name, is not known to be wild in India. Besides these two, there are over sixty other species known in China and Japan, many of them in the Province of Yunnan. A few of these have been introduced through the *Jardin des Plantes*, Paris, whither seeds were sent a few years ago by the missionary-collector Delavay. I have seen the dried specimens of these new kinds, and like the look of them. Mr. Hemsley says of them that, taken as a whole, they are by no means so gorgeously beautiful as the Himalayan Rhododendrons, though many of them are highly ornamental.

R. Fortunei is a plant of special interest, as it bears a close resemblance to the grand *R. Aucklandii*, although not quite so large in flower; it is quite hardy in the south of England. It was introduced by Fortune, and sold by auction in Stevens' rooms in 1859. A peculiarity of this species is in the flowers often having six or seven segments, the usual number being five.

R. rhombicum, from Japan, is an interesting plant, with deciduous leaves and rosy-purple flowers. It came to England through the St. Petersburg Botanical Gardens in 1872.

R. linearifolium is a remarkable plant from the same country, which was introduced by Standish in 1869. It has narrow soft hairy leaves and loose clusters of pale rose-purple flowers, which have long corolla lobes, free to the base. It is said to be quite hardy.

"*Azalea mollis*" is a garden plant in China and Japan. It was in cultivation here in 1824, and known then as *A. sinensis*. Fortune reintroduced it in 1845, since which time it has attained great popularity as a garden plant. This and several other species are referred to again under *HYBNIDS*.

"*A. indica*" has a history very nearly analogous to that of the *Chrysanthemum* in regard to its introduction, cultivation, and improvement in Europe. In the *Botanical Magazine*, t. 1480 (1812), it is figured, and described as, "A very rare plant, which has been long anxiously sought for by cultivators of curious and scarce exotics. We believe there are not above three or four individuals of it in the country, and of these only the one in the collection of James Vere, Esq., from which our drawing was taken, has as yet produced any flowers." In the same place it is stated that Kämpfer enumerated twenty-one varieties cultivated in Japan, including white, red, yellow, purple, and scarlet, with spots of the most contrary hues. Fortune says of this species, "Every mountain and hill in the central and southern provinces of China is covered with these beautiful plants. They are like our own Heaths, and quite as abundant. By far the finest are cultivated in gardens, indeed it was only in gardens that I could find any worthy of introduction into England." The Dutch cultivated *A. indica* in 1680, but soon lost it, and it was not reintroduced until the beginning of the present century. Mr. Knight, of King's Road, Chelsea, purchased in 1833 five varieties, one double-flowered, two reds, and two large-flowered, from a sailor who had brought them from China. Messrs. Low & Co. advertised twenty-one named varieties in 1841. Since then the French, the Belgians, and others, have crossed and bred from this plant with really wonderful results. I question if there is anything in the

* A paper read before the Kew Gardeners' Society, by W. Watson, Assistant Curator.

FIG. 114.—AZALEA OBTUSA. (SEE P. 711.)

wall than they are usually placed. This enables the quadrant-shaped front trellis to be put nearer the glass, without in the least shading the trees behind. Camellias are grown on the back walls, and thrive in a wonderful way in that position; they begin flowering at the end of September. Melons are grown in quantity, the favourite variety being McDoe's Scarlet Premier. Splendid luscious Figs are grown from plants in pots plunged up to the top in pits. Two new houses for growing Pines were being erected by Allen of Holmeschapel. This enterprising firm have put into the work all their latest improvements. They are 8½ yards wide, an unusual breadth, and are glazed with a patented system of Mr. Allen's, which seems an improvement on other systems. A groove is cut in the upper surface of the rafters, by which the condensed vapour can run down into the pipes, which are made of wood painted with an anti-corrosive paint, no lead covering being put on because it makes the wood decay quicker. The ventilation system, a combination of the screw and lever, could be worked without any trouble. The stoves were very well furnished, interesting plants being the *Vanilla* and the lattice-

clambering up each iron pillar. As they were nearly all in flower at the time of my visit, I will give a list of them:—*Solanum jasminoides alba*, *Clematis indivisa lobata*, *Begonia fuchsoides*, *Taxsonia*, *Luculia gratissima*, and a *Passiflora*, an *Abutilon Volkemi*, and a *Fuchsia*. Growing as these climbers were, in a state of abandon, it is no wonder his lordship often makes this house a retreat. The third house is a little cooler, and the centre is taken up with tall-growing Palms, Tree Ferns, and Cycads. There are iron pillars in this house, too, each devoted to a separate climber. Without giving a full list, I will notice those that were most effective; they were *Clerodendron Balfourianum*, *Hibiscus*, *Bougainvillea*, and *Justicia carnea*. The biggest *Cycas* in the house was raised from seed by Mr. Whitaker, soon after he came in charge. It was a very good idea erecting these three conservatories in connection, and no one can go through them, so well stocked are they, without being intensely interested. But this is not the only reason why I claimed that the surroundings of the kitchen garden were unique. All the way round is a gravel walk; at the entrance it is lined in one direction

way of flower improvement more creditable to horticultural art, except, perhaps, the Rose and *Chrysanthemum*.

"*A. amana*," "*A. obtusa*" (fig. 114), "*A. calyciflora*," well-known garden plants, are merely geographical varieties of *A. indica*. They are all hardy in the south of England. Two other hardy forms have lately been distributed by Messrs. J. Veitch & Sons, named Daimio and Mikado. In some parts of England the old white Azalea is hardy. Beds of it are being planted in the open air at Kew.

NORTH AMERICAN SPECIES.

Everyone of the *Rhododendrons* known to be wild in North America has been, or is, in cultivation in England. The evergreen species, viz., *californicum*, *macrophyllum*, *maximum*, *punctatum*, and *catwbiense*, are perfectly hardy here. The last-named shares with the European *R. ponticum*, and several of the Himalayan species, the distinction of being the parents of the splendid race of hardy *Rhododendrons* we now possess. *R. catwbiense* grows from 3 to 20 feet high, has broad leaves, and lilac-purple campanulate flowers. It is a native of the mountains of Virginia to Georgia. According to Loudon it was introduced in 1809, and soon became common in gardens. *R. californicum* is very similar to it. *R. maximum*, the Rose Bay of the Americans, is a beautiful plant, equal to many of the hybrids, but it does not always thrive in English gardens. It blooms late, usually in July. *R. punctatum*, from Carolina, is also a late-flowering kind.

The deciduous species, commonly called Swamp Honeysuckles, rank with the very best of the garden plants from North America. The deliciously-fragrant *R. calendulaceum*, or, as it has been called, *R. coccineum*, is said to colour wide stretches of country in Virginia with its gorgeous flowers in June. They are of every shade, from lemon-yellow to the most brilliant fire-red, even when wild. This species was introduced by Lobb in 1837, when it was at once called into requisition by the hybridist; Mr. A. Waterer, amongst others, having used it largely as a breeder. *R. arborescens*, *R. viscosum*, introduced in 1734, and much used for hybridising; *R. canadense* (*Rhodora*), and *R. vaseyi*, are the other wild Azaleas or Swamp Honeysuckles of North America. They are all as fragrant as the plant from which they take their name, and they are as happy in the ordinary border of the English garden as *Laurustinus*. The collection of them in the arboretum at Kew is a gorgeous picture when in flower, in June. *W. W.*

(To be continued.)

PLANTS IN FLOWER AT LA MORTOLA IN DECEMBER.

HAVING just returned to my garden here on the Riviera, after a more prolonged absence than usual in England, it may be of interest to some of your readers, especially those who reside on this coast, or visit it during the winter, to know what plants I have in flower in the open border at present.

The usual summer drought which regularly afflicts these parts broke up at the end of September; a copious rainfall has started the winter vegetation most satisfactorily, and although the nights are already very cold, and ice is to be seen in the valleys, the flowering of Roses is abundant, and vast quantities are daily despatched by those who make a business of supplying cities in less favoured climes.

After the Roses, perhaps *Salvias* make the greatest show at this time. I have nineteen species in blossom, of which *S. frutescens*, with its large scarlet flowers in panicles, and *S. leucantha*, with a white and lavender woolly texture, are the most striking.

Of the *Bignoniaceæ* there are five species in flower, the most splendid of which is *Pithecoctenium buccinatorium*, climbing on my house with gorgeous deep scarlet trumpet-flowers. *Tecoma capensis* blossoms very freely here through the winter, and *T. stans* is remarkably pretty with its bright yellow flowers.

Aloe ciliaris, of which I have a very large plant growing on the south side of my house, is covered

with hundreds of red flowers, and climbs most luxuriantly in a tangled mass near a giant *Euphorbia abyssinica*, 20 feet high; *Senecio præcox*, *Opuntia cylindrica*, and *O. subulata* being all more or less covered by its rampant growths.

In the pergola or trellised walk are the following in blossom, *Cypripedium insigne*, *Eschyanthus grandiflorus*, *Daphne indica*, *Linum trigynum*, and *Reinwardtia tetragyna*. Lower down, prominent shrubs in flower are *Cestrum aurantiacum*, *Chænesthes fuchsoides*, and *Lochroma grandiflorum*, the two latter will probably be cut back by the night frosts in January. Of the *Proteaceæ*, *Banksia marcescens*, with its huge bottle-brush flowers, and *Haakea eucalyptoides* resembling a scarlet pincushion, arrest the attention of the most superficial observer. An old wall covered with the intensely scarlet flowers of *Tacsonia manicata* is a grand sight. Of rare plants in blossom I may mention *Melianthus Trimenianus*, *Pilocarpus pinnatifolius*, *Grevillea Preissii*, *G. glabrata*, *G. rosmarinifolia*, and *G. Thelemanniana*. *Dahlia Maximiliana*, a small tree, will keep in flower all the winter, should it not prove too severe.

Datura arborea and *D. sanguinea* are full of flower, as are two species of *Bouvardia*, but will hardly resist the cold of January; not so *Buddleia auriculata*, and *B. madagascariensis*, which are hardy enough, as are the *Fuchsia*-like *Correa cardinalis* and *C. Colvillii*. *Clematis cirrosa* loves the sun and drought, and is very pretty with its dense foliage and pretty hanging bell-shaped greenish flowers. *Eriocephalus africanus* flowers profusely through the winter, its leaves have an agreeable Thyme-like scent. The Olive crop is nearly a failure this year, but *Orange* and *Lemons* are abundant and cheap.

Of rare fruits in this garden, I may mention *Carica cundinamarcensis*, *Diospyros kaki*, *Solanum betaceum*, *Cydonia sinensis*, and *Psidium Cattleianum*, all eatable except perhaps the first-named, which I can only recommend for its delicious scent. The fruit of *Pyrus sorbus* is most excellent when eaten at the right time, but it is not seen at the hotel tables. The fruit of *Aberia caffra* is now past, while of the *Citrus* family the *Buddha-fingered Citron* and *Pommaloe* from China, the historically interesting *Santa Sabina Orange*, and the *Bergamot Orange* are hardly ripe yet.

To those who love plants, who can take at least ten days' holiday, and are proof against the seductions of the gaming-tables at Monte Carlo, I suggest a Christmas spent in the brilliant sunshine and clear air of this coast. The total number of species in blossom I find to be 228. *Thomas Hanbury, La Mortola, December 12.*

HOME CORRESPONDENCE.

THE CONIFER REPORT.—I am disappointed at not finding any report on the growth of these plants on bad land in bad condition, such as that which obtains in nearly all the Conifer districts from the Dutch frontier to Hamburg, and such as exists in many parts of Surrey, Berks, and Hants. In my own case, I have peaty-sand covered with an iron "pan" beneath. Underneath the pan is clay, and if the pan be broken up, the iron gets into the top soil whilst the pan reforms. We have also an insufficient rainfall, so that the results as chronicled from Scotland, Ireland, and the West of England are little guide to us. It is a pity the influence of iron was not discussed at the Conference; it is far more important than the presence of chalk, because a great many people plant Conifers on iron, whilst comparatively few plant them on chalk. Seeing how well the Scotch Pine does on iron-sand, the planter naturally thinks other Conifers will thrive there too. But which? This is just what we wanted to know from the Conifer Report, and just what we do not find in it. *Surrey*. [The Reports from the English countries are indeed meagre, as compared with those from Scotland, and many remarkable specimens in various parts of the country unfortunately are not recorded. A large number of circulars were, we are told, sent to English growers

but comparatively few were returned. This points, to the desirability of a second Conference in a year or two's time, to remedy the defects of the present Report. In the meantime, we shall be pleased to publish details such as those alluded to by our correspondent, measurements of particular specimens, &c. Ed.]

LILIES IN MR. WILSON'S GARDEN AT OAKWOOD.—It may save repetition in my note on our Lilies of the past season to confine it as much as possible to facts which seemed to be at all remarkable. *Lilium auratum rubro-vittatum* and *L. Krameri*, of very many shades of colour, growing among *Rhododendrons* in a mixture of vegetable soil and light loam, continued to flower well, as did *L. Leichtlinii* in light loam on the "mountain" side. Having a large bed of *L. auratum*, planted in 1887, where the plants were too crowded, we took up a number of bulbs, and came upon eight stems very near together. These all came from one bulb, which could be separated into seven good bulbs; and afterwards, when moving a quantity of Lilies to new beds, where they would be more in view, we found a bulb of *L. speciosum rubrum* with eleven stems, which divided into nine flowering bulbs. These had been undisturbed since 1885. From the same place we took two bulbs of *L. Szowitzianum*, each weighing 1 lb. 10 oz., one of them being solid, the other nearly divided into two. Our tallest stem of *L. giganteum* was 8 feet 9 inches, and had thirteen flowers. This is only a moderate growth, but *L. cordilolium* with eight flowers, and stem 5 feet 8 inches, was, I think, exceptionally fine. Our tallest *L. superbum* was 10 feet, and *L. pardalinum* 9 feet 6 inches. Our pot Lilies in the conservatory here, both the different varieties of *L. auratum* and *L. speciosum*, were unusually fine, and on repotting were found to have increased their bulbs both in size and in number. Their soil was old top spit turf in lumps, and leaf soil. Our Lilies here in the open, in sunk casks with the bottoms out, proved more than ever the advantage of this mode of cultivation. In one cask we had twenty-one stems of *L. tigrinum Fortunei*, the tallest 8 feet 6 inches high. Grown as close as these, of course the top soil should be renewed every year, especially with soil-exhausting Lilies like *Tigers*. The tops of the casks should not be sunk much below the surface of the surrounding soil. Where this was so we found some shrub roots had come in over the top of the cask. *George F. Wilson.*

CULTURE versus NATURE.—In your issue of December 3, there are some interesting remarks under the heading "Culture versus Nature," regarding the "constitutional flexibility" of plants with respect to altitudinal range and resulting temperature. Some remarkable instances of this flexibility occur in southern India, both in wild and cultivated plants. One very notable example of a wild plant, with cosmopolitan habits as regards altitude, is found in a species of *Dodonæa*. This shrub, which yields a great portion of the firewood used in Madras city, grows luxuriantly on most of the uncultivated sun-scorched plains of the Carnatic, along with purely tropical species; and yet it abounds at various elevations on some of the hill ranges, the highest point being a little over 8000 feet on *Dodabetta Peak*. At this high elevation it is in winter exposed to sharp frosts, and has as its companions various representatives of a temperate flora. Another plant possessing wonderful flexibility is the *Australian Grevillea robusta*. This very handsome tree has been introduced with much success in India, and may be seen flourishing in Madras, and also at *Ootacamund*, the latter station having an elevation of about 7500 feet. It may be noticed in passing that at high elevations it is liable to suffer somewhat from the frosts. The *Araucaria Cunninghami* may also be seen growing at very different altitudes; but on the plains, as might be expected, it is very tender, and requires nursing. *G. Bidie, Jersey.*

EUONYMUS EUROPÆUS.—I see attention directed to this shrub in your last issue. It is indigenous here, growing tolerably plentifully in the park upon heavy soil, along the foot of a hill, which is occupied by Oaks. Here the largest plants reach some 20 feet in height, and they are, as Mr. Divers observes, very pretty objects in the autumn months, attracting the notice of the most unobtrusive person. This shrub could be effectively employed in suitable positions by the sides of carriage-drives and similar places, but it would not be advisable to use it, unless protected, where rabbits are numerous, for they appear to be very partial to its bark. Its wood is

very brittle, and old plants make numerous short twiggy growths, which produce its bright fruits in great numbers. We have a plant of *E. latifolius* in the pleasure grounds, but it does not fruit so freely as the common kind does, owing probably to being placed in a somewhat shady corner. It is slow in growth, as eighteen years ago it was 5 feet in height, and at the present time about 11 feet, but, according to Nicholson, it does not attain great height. *Thos. Coombe, Hendre Gardens, Mon.*

DAPHNE GENKWA, &C.—This shrub has stood well here for the two last winters without any protection (p. 702). *Diospyros Kaki* (p. 712), I have had good fruit for several years from a tree against a south wall. I believe it would do as a standard. This year the spring frosts cut back the young shoots, and I have no fruit, but the tree is very strong and healthy. *H. Ellacombe, Bitton, Bristol, December 10.*

CIEN OR SCION ?—The statement which appears on p. 706, that the difference between cien and scion is not generally known is perfectly true, because no English or French author ever tried to use them as different words. If Bacon spelt the word cien, his contemporary Shakespeare spelt it syen (see Henry V., Act iii., Sc. 5, old editions); and Philemon Holland, another contemporary, in his translation of Pliny, spells it sion. In those days phonetic spelling prevailed over etymological. All that is known of the history of scion, which is a French word, is given in Littre's large lexicon. French authors are quoted to show that it was written cien in the thirteenth century, syon in the fifteenth, and sion in the sixteenth. Its derivation is doubtful, but Skeat and Littre favour the opinion that it is a corrupted form of the Latin word section, a cutting (these words all pass from Latin into French with the final n, which they originally had). Littre supports this opinion by the analogy of the German word for scion, schnittling, derived from schneiden, to cut. We do not, however, find that any Latin writer—and some treat very fully on the subject of grafting—uses section for scion. Inscition, which in classical Latin means the operation of grafting, is said to be used in very late Latin for scion, and some philologists have supposed that scion may be a corruption of (in)scition, but the earlier Latin writers always use surculus or calamus for scion. *C. Wolley Dod, Edge Hall, Malpas.*

OPEN SPACES.—One by one the London market gardens are disappearing, to be swallowed up by the devouring builder. Part of Dancer's ground at Chiswick is now covered with houses in the Duke's Avenue, leading to historic Chiswick House. A good portion of the extension plot known as Bagley's in the High Road is also devoted to bricks and mortar. It is pleasant with this inevitable state of things in London's teeming population, to refer to another side of the picture. At Fulham, at one time famous for its Cabbages (have we not a variety designated "The Fulham"?); one of the old market gardens there has been transformed into a recreation ground for the inhabitants, the work of formation and planting being at the present time carried out by Messrs. W. Fromow & Sons, Chiswick. *J. B.*

ROOT-WORK.—The propriety of employing the grubbed-up stumps of timber trees as a means of adding a feature, presumably of some sort of embellishment, to a garden, has been often discussed in your own and other gardening papers, and very opposite views seem to be entertained. I should on many points condemn the practice without qualification as being false in taste, and attended with so many serious objections, were it not that the custom is persistently advocated by gentlemen of skill and varied knowledge of the needs of horticulture. It is well to keep in mind that circumstances alter cases; there may be something said on each side of the question. In a flat country, without the resource of masses of stone, it is often necessary to form a screen for giving shelter to Ferns or other shade-loving plants, and roots being at command, I can well understand as a matter of convenience their being employed; and if the district is naturally dry, and the soil light, and roots from resinous trees used, one of my great objections to their employment is modified. If creepers are abundantly planted and trained, so as to hide what is beneath them, so much the better; but here your correspondent "A. Y. E.'s" objections come in with great force, and one's toleration of even the best form of root-work is shaken by the idea of the intrusion of rats, mice, and rabbits, creatures of varied tastes, but ever

prone to take that which is most valuable. Looking at the practice in another aspect, and as one justified by taste and picturesque effect, there is nothing to give a natural charm to it; the most obvious idea connected with it is an upheaval caused by an earthquake, such a convulsion alone turning trees upside down. In the endeavour to state the case as fairly as possible for each side of the question, and as modifying one insanitary aspect of it, I have mentioned the use of resinous roots, and their elevation in a sandy district, above the mean level of the ground; but roots of Elm, Oak, or other deciduous trees, made use of especially in a wet district, in a heavy soil, speedily bring about a state of things which had much better be avoided, rottenness very soon ensues, the dead or decaying roots become speedily the home of the all-pervading fungi. These luxuriate and mature, and their spores fill the air. Mosses and lichens appear, and their minute germs do not add to the purity of the air. The roots become the resort of slugs, snails, and beetles, and no corrective influences to contract the general state of rottenness and decay can be brought effectually to bear upon a woodland thus rendered dangerous to health, and affording no satisfactory aspect of beauty to justify its introduction. *W. Ingram, Belvoir.*

— In my note on root-work on November 12, p. 593, I gave an experience of it under specified circumstances. A first-class amateur hardy-plant grower has informed me that rabbits and rats had made him give up a root-work. This agrees with "A. Y. E.," p. 711. I only thought of gardens where rabbits are not admitted. We have no trouble with rats, probably owing to cats having the run of the root-work. *G. F. Wilson.*

HOW TO CATCH WOODLICE.—Sink saucers half-filled with beer level with the ground; in this way, I have caught thousands in the Mushroom-house, in the Cucumber and Violet frames. Knowing how destructive woodlice are if they abound, I am sure many readers of the *Gardeners' Chronicle* will be glad to know the above simple remedy. *J. Hinton, Pull Court Gardens, Tewkesbury.*

EDINBURGH BOTANIC GARDEN.—I think that more of your readers who have the good fortune to know the Edinburgh Botanic Garden, will agree with the note of "Vagabond," p. 651, rather than with that of "Voyager," p. 712. I knew the garden in Mr. McNab's time, when alpine and hardy plants were his especial hobby, and got good lessons there, and since under Mr. Lindsay's care, who I think most hardy-plant growers will agree with me in classing at Al as a cultivator. I wish he lived a little nearer here to consult with in difficult questions. The deeply-sunk elabs are formal, and do not profess to be otherwise. Mr. McNab thought the isolation of different plants to be very important, and he knew what he was about. I have not had the chance of seeing the garden for several years; but a friend, a good judge, reported a visit paid this year, and spoke enthusiastically as to the plants. *G. F. Wilson.*

THE GARDENERS' BENEVOLENT INSTITUTION.

—I have attentively read the excellent letter of your correspondent, J. H. Goodacre, upon this subject, although I may not, in all respects, quite agree with him. In the first place, I may say, that I think there can be no objection to confining the name of the institution to that by which it has long been known, viz., "The Gardeners' Royal Benevolent Institution," for the purpose of registration, as suggested. Your correspondent says, "Unless some sound practical inducements are brought forward, the young men will not enlist any more freely than has hitherto been the case." It is certainly hardly creditable to the gardening fraternity to think that its members should have hung back as they have done in assisting an institution which has for its sole object their benefit and assistance, should they unfortunately ever require the same. Even a feeling of gratitude might go far to induce gardeners, as far as lies in their power, to assist an institution which exists for their sole benefit, and which is at the same time so kindly and so generously assisted by outsiders, or a portion of the public which can have no feeling or interest in the matter further than a love for horticulture and a kindly feeling towards those engaged in the pursuit as a means of earning their livelihood. It may possibly be found that, in some form, improvement may be effected in the management of the institution; and if so, all lovers and well-wishers of the same will be exceedingly pleased.

But what is most required, and what would be most appreciated, would be the increased support of those for whose benefit the institution continues to exist. If this continues to be persistently withheld, need we feel greatly surprised if, in time, the most generous and kind friends of the institution become somewhat lukewarm and weary in their efforts of trying to assist those who do not care to try to assist themselves, or, at least, their brethren whose lot in life may prove less fortunate than their own. I am quite well aware that guineas among gardeners are, generally speaking, far from being plentiful, but if an effort is made to subscribe to the institution, it will, in many instances, be found to be successful, and it may be considered as an act very unlikely to be repented. I fail to see any great difficulty or tiresomeness in soliciting votes, as alluded to by your correspondent. If this, or something of the kind, was not done, intending voters might fail to know the most deserving or urgent cases. Your correspondent does not admire the word "charity;" the word may very well be dispensed with as regards this institution, if, indeed, it has ever been used in connection with it. This institution, however, must continue to be a benevolent one, and no one need to feel ashamed to accept assistance from it, it being an institution to whose funds he may have subscribed, and even in cases where the applicant may, from no fault of his own, never have been in a position to subscribe to its funds, and it is to be feared that there are too many instances of this kind; still, it is satisfactory to the successful applicant to this institution to know that he is being assisted by an institution whose funds are being supplied by lovers of horticulture, and by his horticultural brethren, who may, in some respects, have been more fortunate than himself. *P. G.*

— I was much pleased to see Mr. J. H. Goodacre's letter in the *Gardeners' Chronicle* (p. 711), and also the Editor's remarks and advice, and I hope that all horticulturists will give due consideration to this matter, and offer their candid opinion to, and assist the committee by, expressing their views on any alterations that they think would best serve the object for which the institution exists. Those who cannot attend the meeting can still write and give their opinion to the committee. I for one, and many more who I have talked the matter over with, should much like to see abolished the present system of election by votes, or, if not quite done away with, restricted as much as possible, and preference given to old members of the institution. *Wm. Smythe, the Gardens, Basing Park, Alton, December 12.*

— Mr. Goodacre, on p. 711 of the *Gardeners' Chronicle*, draws attention to the circular which has doubtless been received by all gardeners who are members of this institution. I advocate a system of graduated subscriptions to encourage young men to join; also, a new rule, to allow head gardeners to pay their subscription of one guinea by half-yearly or quarterly payments, as it is not every gardener who can afford to pay the guinea all at one time, leave alone subscribe ten guineas to become a life member. With respect to abolishing the present system of soliciting votes, if gardeners could only be persuaded to join in sufficient numbers, the time would come when there would be numbers of men eligible who, having fulfilled all the requirements of the rules, &c., would naturally receive their benefit by right, without election, and so do away with the present system of voting. The present system of voting could not be done away with without the consent of the large number of life donors, &c., who will never require any assistance from the funds. I am not speaking of gardeners who are life donors. Either you must continue the present system with useful amendments, or make the institution a benefit society on the lines of the Manchester Unity, &c. I have no confidence in any Government scheme of insurance. The Manchester Unity and other societies will forestall and provide a far better scheme for insurance of an annuity in old age, and by much easier payments. If only cohesion could be for once effected amongst gardeners, the institution might become popular (but it never will in this or any other cause). A great many who receive the benefit of the funds have never subscribed to it at all, and a great many gardeners at the present day have no faith in it, and will tell you it will never do them any good. Let us put self on one side for the present, and join in providing help to those of our more unfortunate brothers, &c., who have nothing to help themselves with. There is an old problem that charity begins at home. Let every

gardener who has not done so join this institution, and so receive eventually the benefit of their own charity. *John Chinnery.*

SOCIETIES.

ROYAL HORTICULTURAL.

DECEMBER 13.—On Tuesday last (which was the last occasion on which the committees of the Royal Horticultural Society will meet until the New Year) the show was an unusually fine one. Interesting and bright displays of Orchids were contributed by nurserymen and amateurs, whilst the fine collection of Chrysanthemums, also contributed by both groups of exhibitors, was such as could hardly have been expected at so late a date. A good batch of Cyclamens, a few berried plants, and other seasonable plants very fittingly made the last meeting one of the pleasantest of the year. A large number of Fellows were elected at a meeting at 3 o'clock, but the lecture on "Berry-bearing Plants" had been unavoidably postponed.

Floral Committee.

Present: W. Marshall, Esq., chairman; and Messrs. R. Owen, R. Dean, H. Herbst, F. Bause, H. B. May, G. Nicholson, F. Ross, R. B. Lowe, G. Gordon, W. Furze, W. Bennett-Pöe, E. Mawley, C. J. Salter, T. Baines, H. Turner, H. H. D'Ombrian, J. Fraser, G. Paul, B. Wynne, George Phippen, and W. H. Williams.

Messrs. Paul & Son, Cheshunt, contributed an interesting group of seasonable berried plants in great variety, together with some home-grown plants of *Azalea mollis* in flower, to show the adaptability of these home-grown roots for very early forcing (Silver Flora Medal).

A very fine collection of well-flowered Cyclamens, in the various shades of colour, was contributed by Messrs. H. Cannell & Sons, Swanley, and was awarded a Silver Banksian Medal. Mr. H. B. May, Dyson's Lane Nursery, Upper Edmonton, sent a collection of Crotons in variety, of good colour, and of useful size for table decoration (Silver Flora Medal).

A First-class Certificate was awarded to Messrs. Jas. Veitch & Sons, Chelsea, for *Camellia Sasanqua*, which was shown in single red and double white varieties. This is said to be quite hardy. The same firm also exhibited some plants of *Begonia Winter Gem*, in full bloom. This is a very fine *Begonia* for winter work. Its habit is good, the inflorescence strong, and the flowers well above the dark green foliage. The blossoms are single and of bright crimson colour.

Mr. T. S. Ware, Tottenham, sent some plants of *Narcissus Bulbocodium* var. *monophyllus*, and also a few pots of *Iris Hestrio* in bloom. This beautiful *Iris* is extremely well adapted for pot-culture, and just at this season its worth as such must be very great. A figure of this plant will be found on p. 729. A *Carnation* (Whipper-in) and flowers described as Seedling *Primula obconica*, but which presented very little difference to the blooms usually produced by that plant, came from Mr. John Roberts, The Gardens, Tan-y-Bwlch, R.S.O., North Wales. Some plants of *Helleborus niger* in full bloom came from Mr. Geo. Wythes, Syon House Gardens.

Chrysanthemums.—Probably such a display of *Chrysanthemums* was never before seen so late in the year as on this occasion. The season favoured late production, but we have now such a number of *Chrysanthemums* that bloom early and late, that, given fair weather, fine blooms, such as those seen on Tuesday, will be had up to Christmas, and even later; and the blooms shown were more than enough to fill one side of the centre table, came from various parts—from Trentham, Staffordshire; from Chilwell, Notts; Swanley, in Kent; Earlswood, in Surrey; and Maidenhead, in Berks.

From Mr. Peter Blair, The Gardens, Trentham, came large stands each of incurved and Japanese, among the former six blooms of Mrs. Robinson King (Award of Merit), which gives a deep golden-yellow form of the Queen type; it originated as a sport from Golden Empress, but when exhibited in the same stand as the latter, it is very important to be sufficiently distinct in colour. Miss M. A. Haggas, John Doughty, Alfred Salter, Empress of India, and Golden Empress, all incurved, were shown in good character for so late a period. Of Japanese, Mr. Blair had G. Maclure, Gaspard Rozain, Mrs. E. W. Clark, fine deep amaranth; and Mons. M. Rivière.

Mr. R. Owen, Castle Hill Nursery, Maidenhead,

had a very interesting collection, because containing a number of highly promising seedlings raised by the exhibitor. Among them was *Anemone*-flowered Japanese Enterprise (Award of Merit), soft pink ray florets, with primrose cushion—very pleasing and distinct. Japanese Countess of Hambleden (Award of Merit), delicate blush-pink, bleaching to white, incurved, with massive broad petals—extra fine; Wabau (Award of Merit), a remarkable and distinct American variety, with large broad blush petals, having slight wine-red margins, the petals at first reflexing, and then curling inwards, imparting to the flowers a very distinct and attractive appearance. Robert Owen (Award of Merit), a very fine rich golden Japanese incurved; H. M. Pollet, an incurved Japanese of the build of Madame C. Audiguer, but paler in colour; three blooms of this were shown, but there were no two alike; Lord Brooke, incurved Japanese, deep yellow, with slight margins of red to some of the petals, very promising; Peter Blair, a large reflexed, golden-buff, reflexed Japanese, very promising, that will no doubt be seen in better condition another season. Of the unnamed seedlings shown by Mr. Owen, was O. 170, a very fine broad-petalled, reflexed Japanese of great promise. Mr. Owen also sent the following incurved varieties: Robert Petfield, bright lilac with silvery reverse; Henry Perkins, pale bronzy-cerise and golden reverse, with long pointed florets, large and full; and Lady Dorothy, a sport from Hero of Stoke Newington, pale in colour on this occasion, being of a pale salmon with golden centre.

From Messrs. Pitcher & Manda, American Nursery, Hextable, Swanley, came a large collection, comprising several fine Japanese varieties, not shown in the best condition; such as Mrs. E. D. Adams, white tinted with rose; Mdlle. Marie Recoura, large pure white, but scarcely full enough for exhibition purposes; Pearl Beauty, a delicate incurved Japanese; Mr. Libbie Allen, pale yellow incurved; Miss Ada McVicker, a very promising delicate incurved Japanese; Mrs. Lay, pale incurved, with lilac base; Oeta, incurved, bronze and gold, very promising; J. S. Matthews, an incurved pale lilac Japanese, with broad petals; Mr. E. W. Clark, Lord Brooke, Louis Bohmer, and the golden hairy W. A. Manda.

Messrs. Henry Cannell & Sons, nurserymen, Swanley, had Japanese Mdlle. Marie Recoura (Award of Merit).

From Messrs. J. R. Pearson & Sons, The Nurseries, Chilwell, came Mrs. Clibraun, a deep pink and purple sport from Princess Teck; Mrs. R. J. Baylis, like Lord Brooke, with the build of Japonais; Fred Dormer (Award of Merit), a pale yellow reflexed flower, one bloom being in good character, the other two indifferent; C. B. Whitnall, incurved, rich amaranth, with silvery reverse, having the build of Refulgens; H. E. Widner, a bright lemon-yellow Japanese; and Mr. Libbie Allen and Oeta.

Mr. W. Wells, Earlswood, had a collection of cut blooms of various types, among them some new single varieties, but having the defect of two or three circles of ray florets, though very useful for cutting from.

Mr. Geo. Wythes, The Gardens, Syon House, Brentford, sent a number of plants of a capital white-flowering sort named Duchess of Sutherland, very free, and, to all appearance, an excellent variety for late blooming.

Orchid Committee.

Present: Harry J. Veitch, Esq., in the chair; and James O'Brien (Sec.), De B. Crawshaw, J. W. Bond, C. J. Lucas, Dr. M. T. Masters, W. H. White, F. Sander, S. Courtauld, E. Hill, J. Jaques, A. H. Smea, H. M. Pollett, Jas. Douglas, Baron Schroder, and T. B. Haywood.

At this, the last meeting of the year, there was a fine display of Orchids, the brightest group being that shown by Sir Trevor Lawrence, Bart., Burford, Dorking (grower, Mr. W. H. White), made up principally of the fine Burford-raised *Calanthes*, of which about forty plants, with flowers ranging from pure white to crimson, were exhibited. Of them C. Veitchii splendens ×, C. bella ×, C. versicolor ×, C. Veitchii lactea ×, and the new C. × Oakwood seedling were remarkably fine. Also in the group were *Masdevallia Hincksiana* ×, M. gargantua, a massive and strange species; a pan of the pretty new hybrid *Dendrobium Burfordiense* × (*Linawianum* × *heterocarpum*), and a noble pan of *Sophrontis grandiflora*, with over forty rich scarlet flowers, and which was unanimously awarded a Silver Banksian Medal.

M. Wells, Esq., Broomfield, Sale, near Manchester

(gr., Mr. R. Hinde), exhibited the pure white *Cattleya labiata alba*, which flowered out of Messrs. F. Sander & Co.'s importation of autumn-flowering *labiata*, and is a great acquisition. The flower was wholly pure white, with the exception of a yellow tinge in the throat (First-class Certificate).

G. D. Owen, Esq., Selwood, Rotherham (gr., Mr. B. Watts), exhibited *Laelia anceps Oweniana*, a large and richly-coloured form, with the additional merit of having the segments conspicuously flaked with white (Award of Merit); *Cattleya amethystoglossa*, Selwood var., with large blush-white flowers, spotted with crimson (Award of Merit); and a dark form of *Odontoglossum maculatum*.

C. W. Lea, Esq., Parkfield, Hallow, Worcester, (gr., Mr. A. G. Catt), sent a spike of the white form of *Vanda teres*, which had been previously certificated to Lord Rothschild.

W. Thompson, Esq., Walton Grange, Stone (gr., Mr. Stevens), exhibited a hybrid *Masdevallia* (*Tovarenis* × *Veitchii*), with white flowers tinged with lilac. It was named M. McVitia × (Award of Merit).

C. W. Fincken, Esq., Hoyland Hall, Barnsley (gr., Mr. Milburn), exhibited a supposed natural hybrid *Laelia* (*albida* × *anceps Sanderiana*?), with white sepals and petals, crimson front lobe to the lip, and fine chocolate lines to the side lobes. The growth of the plant favoured the supposition of its origin (Award of Merit).

Messrs. James Veitch & Son, Royal Exotic Nursery, King's Road, Chelsea, exhibited another of their fine hybrids out of *Sophrontis grandiflora*, viz., *Sophrontis-Cattleya Calypso* × (*Sophrontis grandiflora* ♀, Catt. Loddigii ♂), with indescribably beautiful warm rose-pink flowers with orange centre to the lip (First-class Certificate).

Messrs. Veitch also showed the rich dark scarlet *Epiphrontis Veitchii* ×, and five hybrid *Cypripediums*:—C. Arête × (*concolor* ♀ × *Spicerianum* ♂), a pretty thing of the C. *microchilum* × class (Award of Merit); C. Aeson × (*insigne* ♀ × *Druryi* ♂), C. Pheres × (*insigne* ♀ × *hirsutissimum* ♂), C. Ebone × (*Hookerae* ♀ × *superbiens* ♂), and the pretty blush-white C. Cleola × (*Schlimmii* ♀ × *reticulatum* ♂).

C. E. Smith, Esq., Silvermere, Cobham (gr., Mr. J. Quarterman), showed a noble example of *Cypripedium insigne*, over 4 feet across, and profusely flowered (Silver Banksian Medal).

His Grace the Duke of Northumberland, Sion House (gr., Mr. G. Wythes), also showed an extensive bank of small plants of C. *insigne*, set up very effectively with *Calanthe Veitchii*.

Two large plants of *Cypripedium insigne*, and two of *Zygopetalum Mackayi*, were staged by G. H. Lutwyche, Esq., Oakfield, Beckenham, and were awarded a Bronze Banksian Medal.

Messrs. F. Sander & Co. had a select group, in which were many hybrid *Cypripediums*. One of the handsomest was C. *Johnsonianum* × (*nitens magnificum* × *Lawrenceanum*), a very fine bold flower (Award of Merit). Other noteworthy ones were C. *Alcides superbum* (*insigne* var. × *hirsutissimum*), similar to C. *Pheres* of Messrs. Veitch; C. *multicolor* × (*superbiens* × *Spicerianum*), C. *maculatum* × (*tonsum* × *Leeanum*), C. *Sallierii superbum* ×, C. *Calypso* × *Oakwood* var., C. *Lathamianum* × *Clark's* var., C. *Lynchianum* × (*Spicerianum* × *selligerum majus*), and three very fine forms of C. *Leeanum* ×, that named *Audenshaw* var. being very fine. Messrs. Sander also showed *Cattleya O'Brieniana*, a distinct species, with pale pink flowers; *Laelia autumnalis*, white var., *Dendrobium Cassiope* ×, several *Oncidium Phalenopsis*, the beautiful *Cypripedium Chamberlainianum*, *Masdevallia Courtauldiana* ×, and *Cypripedium insigne* Upper Burma var.

W. E. Brymer, Esq., Ilington House, Dorchester (gr., Mr. John Powell), sent a fine spike of the beautiful crimson *Dendrobium Treacherianum* (Botanical Certificate), a spray of *Oncidium insculptum*, *Laelia anceps* var., &c.

Alex. Fraser, Esq., Westerfield House, Ipswich (gr., Mr. Geo. James), sent a neat form of *Cattleya Leopoldii*, Pernambuco var.

R. I. Measures, Esq., Cambridge Lodge, Camberwell (gr., Mr. Simpkins), exhibited the distinct *Pleurothallis punctulata*, with glaucous leaves, and flowers somewhat resembling those of *Restrepia guttata* (Botanical Certificate); also a small group of fine cut *Cypripediums*.

Messrs. Pitcher & Manda, The United States Nurseries, Hextable, Swanley, showed a dozen distinct forms of *Cypripedium insigne*, C. *Niobe* ×, and C. *N. Shorthills* var.

Philip Crowley, Esq., Waddon House, Croydon (gr., Mr. King), showed *Angræcum pellucidum*.

Messrs. Linden, L'Horticulture Internationale, Parc Leopold, Brussels, and B. D. Knox, Esq., Ardmillan, Caversham, exhibited *Cattleya Alexandræ*, which the committee desired to see again in the hope that better forms may be forthcoming.

Chas. Ingram, Esq., Elstead House, Godalming (gr., Mr. T. W. Bond), sent *Cypripedium marmorophyllum superbum* × (*marmorophyllum* × *Spicerianum*), *C. Chas. Reffold* × (*Gnaphanthum superbum* × *Spicerianum*), and *C. Lathamianum inversum* ×.

Mr. Wm. Bolton, Wilderspool, Warrington, sent flowers of two forms of *Cypripedium insigne*, *C. Chamberlainianum*, and a well-coloured *Cattleya labiata*; flowers of a distinct form of the *Chantini* section of *Cypripedium insigne*, came from Thos. Statter, Esq., Stand Hall, near Manchester (gr., Mr. R. Johnson), and a bloom of the matchless clear yellow and white *C. insigne Sandere*, was sent by Norman C. Cookson, Esq., Oakwood, Wylam-on-Tyne (gr., Mr. Murray).

Other good exhibits were a nice group of showy Orchids, including: *Odontoglossum Rossei* albens, *Cypripedium Pitcherianum* × var. *C. Hookeræ-veitchii* ×, *Lælia autumnalis alba*, *Cypripedium Adonis* ×, a new *Spicerianum* cross, and other good things from Messrs. B. S. Williams & Son, Victoria and Paradise Nurseries, Upper Holloway, N.; and a nice group from Messrs. Hugh Low & Co., Clapton, E., among which were several *Angræcum sesquipedale*, *Cypripedium bellatulum*, a noble *C. Leeanum* with twenty flowers; a fine *Saccolabium giganteum*, *Vanda Amesiana*, &c.

Fruit Committee.

Present: P. Crowley, Esq., in the chair; and Messrs. John Lee, A. Sutton, W. Wilks, G. W. Cummings, G. Taber, T. J. Saltmarsh, G. Bunyard, W. Warren, A. H. Pearson, J. Wright, A. Dean, J. Willard, W. Bates, F. Q. Smith, G. Wythes, J. Hudson, G. H. Sage, F. Q. Lane, H. Balderson, G. Norman, and Robt. Hogg.

Many seedling Apples were presented for Certificates, but none were fortunate enough to find favour with the committee.

Mr. G. W. Cummings, gr. to A. H. Smee, Esq., The Grange, Wallington, had Apple Remborough, which appeared to resemble Blenheim Orange to some degree, and a variety called Smee's Seedling.

Mr. Toogood, Alvalton Hall, Peterborough, recommended Toogood's Seedling as a very fine Apple for market, and as a very free bearer. Mr. H. C. Princep, Buxted Park, Uckfield, showed a large yellow seedling Apple, called The Spires. Seedling fruits also were exhibited by Mr. Ed. Corkey, Frome, Somerset; Mr. W. H. Barmster, gr. to H. St. Vincent Ames, Esq., Cote House, Westbury-on-Trym; and Mr. D. Keen. Two very fine dishes of Apples, one of Golden Noble, the other of Waltham Abbey Seedling, came from Mr. J. Hudson, gr. to Messrs. Rothschild, Gunnersbury House, Acton.

Mr. C. Turner, Slough, sent some fine samples of Knight's Monarch Pear, from pyramids (Vote of Thanks). Messrs. R. H. Vertegans & Co., Chad Valley, Birminghams, sent some fruits of *Diospyros kaki*, and the variety *Huyakune* (Vote of Thanks).

Mr. Jno. Brooke, Forde Abbey, Chard, showed Tomato *Fordiana* for Certificate, but was unsuccessful.

Potato Fidler's Colossal, which was presented at the last meeting, and was sent to Chiswick to be cooked, was again before the committee to-day, and received a First-class Certificate.

Messrs. Cooper, Taber & Co., Limited, Witham, Essex, showed a new Potato called Duke of York, which appeared to be a good solid variety, with small eyes, skin a little rough, and tubers of a fair even size.

From the gardens of the Royal Horticultural Society, at Chiswick, came dishes of the following Apples:—American Mother, Dutch Mignonne, Cogswell, Cox's Orange Pippin, Rosemary Russet, King of the Pippins, Beauty of Hants, and Baumann's Red Winter Reinette; also a very large fine collection of well-grown Beet, in upwards of sixty varieties.

EDINBURGH BOTANICAL.

NOVEMBER 10.—Dr. Christison, President in the chair, read an opening address on the size and rate of growth of some British trees.

Size of British Trees.—In describing the Oaks of Britain he mentioned that the largest was the Cowthorpe Oak in the forest of Dean. The height of

this tree was 85 feet, and it nowhere girthed less than 40 feet. Next to it in size came the Rosamund Oak, near Harrowfield, and then the Seldon Oak.

The Oak did not reach so large a size in Scotland as in England, and the largest Scottish Oak was at Lea, in Lanarkshire; this tree being 23 feet in girth at the narrowest part. The second largest Oak in Scotland was in the Cadyow Forest.

As regards Beeches, the largest in Britain was at Eccles, where a girth of 20 feet was reached at a height of 5½ feet above the ground. The largest tree of this kind in Scotland was the Newbattle Beech, which had a girth of 43 feet at the ground; and at 8½ feet up, where it was narrowest, it girthed 18 feet 2 inches. The circumference of its foliage was 400 feet. The second largest Beech in Scotland, with a height of 122 feet and a girth at its narrowest part of 13 feet 7 inches, was at Milngraden.

None of the Scottish Ashes reached a greater girth than 20 feet at a height of 5 feet above the ground. The largest tree of this kind is at Yair, and had a girth of 19 feet 9 inches at the narrowest part; while at Carnock there was an Ash which at a height of 5 feet girthed 19 feet 3 inches.

No Scottish Fir at present living reached a girth of more than 14 feet, though there were indications of trees which must have girthed at least 20 feet. The largest Yew in Scotland was that at Fortingal; the trunk of this tree was utterly shattered, but it had a circumference of 54 feet at the ground. The largest Yew at present in a thriving condition was to be found at Ormiston, where there was a tree which girthed 13 feet 10 inches at 1 foot above the ground. Of English Yews, the largest was at Darley Dale, where a girth of 32 feet at the ground was reached. The Fountains Abbey Yew had a girth of 22 feet, but the stem was hollow.

Dr. Christison then referred to the age of trees, and pointed out how inaccurate historical evidence is apt to be, on account of the general absence of any accurate determination of the height at which the measurements were made. The method of obtaining the age by counting the annual rings was shown to be inaccurate, though the information afforded by this means was sufficient for a rough estimate up to a very advanced age. Another mode of determining the age of a tree was by repeated measurements of the girth of the stem at the same height. On the motion of Professor Bayley Balfour, a vote of thanks was accorded to Dr. Christison for his paper.

Mr. Lindsay, Curator of the Royal Botanic Garden, read a report on the temperature and vegetation at the garden during September and October. Mr. Lindsay exhibited some capsules of the Opium Poppy which had been pierced by a titmouse in search of the seeds. Plants of *Pernetia carnea* and *bracteata* in fine fruit, were also shown to the society by Mr. Lindsay.

Professor Bayley Balfour exhibited a large pitcher of *Nepenthes bicalcarata* preserved in spirit.

Report of Temperature and Vegetation in the Garden for July, 1892.—The weather of July was for the most part cool and unsettled, with heavy falls of rain, and with one or two gales of much severity for the time of the year. The lowest night temperature was 40°, which occurred on the 10th of the month, and the highest 54°, on the 31st. The lowest day temperature was 55°, on the 12th; and the highest 79°, on the 31st. The growth of trees and shrubs during the month was fairly good; most herbaceous plants flowered very well, and Roses were very fine towards the end of the month. On the rock garden, 237 species and well-marked varieties came into flower, as against 252 for the corresponding month last year. A few of the more interesting were:—*Convolvulus lineatus*, *Cyananthus lobatus*, *Dianthus cinnabarinus*, *Epilobium Fischerii*, *E. obcordatum*, *Erythraea diffusa*, *Eriogonum aureum*, *Gentiana septemfida*, *cordifolia*, *Gillenia trifoliata*, *Kniphofia caulescens*, *Linaria organifolia*, *Mecopopsis Wallichii*, *Primula Poissonii*, *Saxifraga diversifolia*, *S. fimbriata*, and *Silene Elizabethæ*.

August, 1892.—August was a most inclement month; no really warm days occurred, and altogether the month was a most unfavourable one. The lowest night temperature was 35°, which occurred on the 10th of the month; and the highest 58°, on the 14th. The lowest day temperature was 51°, on the 8th; and the highest 74°, on the 13th. On the rock garden 103 species and varieties came into flower, as against 84 during last August. Amongst the most conspicuous or interesting were:—*Campánula isophylla alba*, *C. Waldsteiniana*, *Castanea*

chrysophylla, *Coreopsis grandiflora*, *Chelone barbata*, *Dianthus Atkinsonii*, *D. glauca*, *Gentiana asclepiadea*, *G. a. alba*, *G. ornata*, *G. tibetica*, *G. arvensis*, *Lobelia cardinalis*, *Monarda Kalmiana*, *Olearia Haastii*, *Papaver pyrenaicum*, *Scabiosa fumariifolia*, *Senecio speciosus*, *Spiraea bumalda*, *Symphylandra Hoffmannii*, *Veronica longifolia subsessilis*, *V. lycopodioides*, and *Viola cornuta* × *tricolor*.

September, 1892.—The month of September was cool and unsettled throughout. No frost occurred, but the average temperature was very low. The greatest deficiency of heat occurred during the day; there was an entire absence of anything in the shape of warm weather. The lowest night temperature was 35°, which occurred on the 30th of the month; and the highest, 55°, on the 13th. The lowest day temperature was 52°, on the 28th; and the highest 69°, on the 6th. Most herbaceous plants flowered very well this month, particularly species of *Aster*, *Rudbeckia*, *Pyrethrum*, and other *Compositæ*; *Colchicum*, *Kniphofia* and *Crocus* were also fine. Roses flowered fairly well in September. Autumn tints were beginning to show on *Pavia flava* about the middle of the month; and towards the close, the golden-yellow leaves were most beautiful and effective. On the rock garden forty-five plants came into flower, as against forty-one for the corresponding month last year, amongst which were the following:—*Colchicum speciosum maximum*, *C. striatum*, *Carlina subcaulescens*, *Centauria alpina*, *Coreopsis verticillata*, *Crocus annulatus*, *C. medius*, *C. nudiflorus*, *Delphinium nudicaule aurantiacum*, *Gentiana alba*, *Gladiolus Saundersii*, *Hypericum patulum*, *Kniphofia nobilis*, *Liatris elegans*, *Lilium auratum macranthum*, *Montbretia Star of Fire*, *Potentilla formosa*, *Senecio pulcher*, and *Teucrium flavum*.

October, 1892.—The month of October was very cold, with much frost and rain. The first frost this season took place on the 2nd of the month, when the glass registered 32°. The thermometer was at or below the freezing point on nine occasions, indicating collectively 44° of frost for the month. The lowest readings were on the 11th, 26°; 19th, 28°; 24th, 23°; 25th, 19°; 26th, 20°. The lowest day reading was 44° on the 25th, and the highest 62° on the 2nd. Leaves of deciduous trees and shrubs began to fall early in the month. Autumn tints were most conspicuous on species of Oak, Maple, Cornus, Azalea, Pyrus, and Berberis. The brown tint on varieties of *Biota* and other Conifers is also very distinct and interesting. Fruit is most abundant on trees of *Pyrus latifolia* and *Holly*; *Cotoneaster* and *Pernetia* are fairly well set with berries. Flowering herbaceous plants continued to blossom till the 25th of the month, when the severe frost, which then took place cut off the greater part of them. Large masses of *Polygonum vacciniifolium*, which was most attractive on the rock garden during the early part of the month, was completely destroyed at the same date. On the rock garden fifteen species came into flower during October, as against thirteen for October, 1891. Amongst those which flowered were *Aster longifolius*, *Crocus Asturicus*, *Crocus Salzmanni*, *Helleborus albicans*, *Hypericum Nepesense*, *Parochætus communis*, *Rudbeckia Newmanni*, *Sedum spectabile*, *Statice minuta*. The total number which have flowered since January 1 is 1208; during the same period last year 1210 had flowered.

Obituary.

WILLIAM PRATT.—A large number of our readers will regret to hear that William Pratt (until lately head gardener to the Marquis of Bath, Longleat, Warminster), died on Monday night last at the Southgate Hotel, Southgate Street, Bath, where he had been carrying on the business of a wine and spirit merchant during the past three or four months. During the nine or ten years that the deceased was at Longleat he acquired a name for himself in Grape-growing, especially in the cultivation of Muscat of Alexandria, the crops of which were the admiration of all who saw them. The deceased, who was forty-two years of age, was a first-rate Grape-grower, and a good all-round gardener, as the condition of Longleat gardens during the time that he had charge of them fully testified. He was genial and courteous, and very popular with all with whom he came in contact. Previous to taking charge of the gardens at Longleat, the deceased was for several years head gardener to Lord Hill, Hawkestone,

Shrewsbury, where he distinguished himself in the culture of plants, &c. Mr. Pratt has left a wife and young family.

F. BEDFORD.—Died on Saturday, December 10, at Straffan, co. Kildare, of consumption, WILLIE, eldest son of Mr. F. Bedford, age 20. He was a young gardener of great promise, and is deeply regretted by all who knew him.

THE WEATHER.

(By the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.)

Table with columns for DISTRICTS, TEMPERATURE (ACCUMULATED), RAINFALL, and BRIGHT SUN. Rows list districts from 0 to 10 and provide data for the week ending Dec 10.

The districts indicated by number in the first column are the following:— 0, Scotland, N. Principal Wheat-producing Districts...

THE PAST WEEK.

THE following summary record of the weather for the week ending December 10, is furnished from the Meteorological Office:—

"The weather during this period was decidedly cold and changeable, with frequent falls of cold rain or snow, alternating with fine, bright intervals.

"The temperature was below the mean in all districts, the deficit ranging from 3° in the 'Channel Islands,' and 4° in 'Ireland, N.,' to as much as 6° or 7° over the northern and north-eastern parts of the kingdom.

"The rainfall exceeded the mean in England, N.W.; and 'Ireland, N.,' but in the other districts it either just equalled or was a little below the normal.

"The bright sunshine was more prevalent (except in 'Scotland, N.')

ROYAL BOTANIC SOCIETY.—A meeting of Fellows of this Society was held on Saturday, December 10, Major J. W. M. COTTON in the chair.

MARKETS.

COVENT GARDEN, December 15.

MARKET still very quiet, with heavy supplies. No alteration in prices. James Webber, Wholesale Apple Market.

FRUIT.—AVERAGE WHOLESALE PRICES.

Table listing fruit prices: Apples, p. half-sieve 0-3 6; Nova Scotia, per barrel 10-17 6; Cobs, per 100 lb. 129 0 125 0; Grapes, per lb. 0 6-2 0; Lemons, per case 11 5 0-35 0.

PLANTS IN POTS.—AVERAGE WHOLESALE PRICES.

Table listing plant prices: Adiantum, per doz. 4 0-12 0; Aspidistra, per doz. 15 0-30 0; Chrysanthemums, p. doz. 4 0-12 0; Cyclamen, doz. 9 0-13 0; Cyperus, per dozen 4 0-10 0; Draecena, each 1 0-5 0; Erica, various, doz. 9 0-18 0.

CUT FLOWERS.—AVERAGE WHOLESALE PRICES.

Table listing cut flower prices: Arum, per doz. bl. 4 0-8 0; Bouvardia, per bun. 0 9-1 0; Carnations, 12 blms. 1 0-3 0; Chrysanthemums, p. doz. blooms 1 6-6 0; Cyclamen, doz. blms. 0 3-0 6; Eucharis, per dozen 4 0-7 0; Gardenia, per dozen 4 0-6 0; Heliotrope, per doz. sprays 0 6-0 9; Hyacinth, 'Romana,' doz. sprays 0 6-1 0; Lilac, white French, per bunch 5 0-6 0; Lithum Harrison, doz. 8 0-10 0; Lily of the Valley, doz. sprays 3 0-6 0; Maiden Hair Fern, 12 bunches 4 0-6 0; Marguerite, per doz. bunches 4 0-8 0; Mimosa, French, bun. 1 0-2 0; Orchids: Cattleya, 12 blms. 6 0-12 0; Odontoglossum crispum, 12 blms. 2 0-6 0.

ORCHID-BLOOM IN VARIETY.

BOLLY and MINSLETO very good in quality.

VEGETABLES.—AVERAGE RETAIL PRICES.

Table listing vegetable prices: Beans, French, lb. 1 0-1 6; Beet, red, per dozen 2 0-3 0; Carrots, per bunch 0 4-0 6; Cauliflowers, each 0 3-0 6; Cucumbers, each 0 6-1 0; Endive, per dozen 2 0-3 0; Herbs, per bunch 0 9-1 0; Lettuces, per doz. 1 6-2 0; Mushrooms, punnet 2 0-; Mustard and Cress, punnet 0 4-; Parsley per bunch 0 3-0 6; Seakale, per basket 2 6-; Shallots, per lb. 0 6-; Spinach, per bushel 3 6-; Tomatoes, per lb. 0 6-1 0; Turnips, per bunch 0 4-0 6.

POTATOS.

The market for English Potatoes is almost at a standstill, owing to the large arrivals of foreign, which are very fine in quality, and in splendid condition, and selling at from 50s. to 60s. per ton.

SEEDS.

LONDON: Dec. 11.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., write that, as is customary at this time of the year, the seed market to-day was thinly attended, with but little business done.

CORN.

Averages.—Official statement of the average prices of British corn, imperial measure (quarter) for the week ending December 10, and for the corresponding period last year:— 1892: Wheat, 26s. 10d.; Barley, 25s. 1d.; Oats, 17s. 4d.; 1891: Wheat, 37s. 10d.; Barley, 39s. 1d.; Oats, 21s. 7d.

NOTICES TO CORRESPONDENTS.

** PHOTOGRAPHS, DRAWINGS, OR SPECIMENS.—We shall be pleased to receive from our Correspondents notes relating to interesting Gardens, together with Specimens or Illustrations of interesting Plants.

BOOKS: Hamish, Shaw's Kitchen and Market Garden is published by Macmillan & Co., Bedford Street, London, W.C. Price about 2s. 6d.—A Subscriber. Orchid Album, published by Messrs. B. S. Williams & Son, Paradise Nursery, Holloway, N.; Reichenbachia, published by Messrs. F. Sauder & Co., St. Albans; Lindenia (English edition), published by the Cie. Internationale Horticole, Brussels; Select Ferns and Lycopods, published by B. S. W. & Son as above.

CARNATION DISEASE: Dianthus. The well-known fungus—Helminthosporium dianthi—so often figured and described in our columns.

CINERARIAS: C. K. The plants seemed to have had a check through cold air from outside being admitted to them after being kept rather close for a time. You can do nothing now beyond being more careful in ventilating the house or pit.

CHICAGO EXHIBITION: Hamish. The population of the U.S.A., including as it does a large number of Germans, and French being the mother tongue of many Canadians, the linguistic accomplishments which you possess will not avail you much.

GERMAN AND FRENCH GARDENERS' CLUBS IN LONDON: Hamish. Mr. Klumbengel, in the Royal Gardens, Kew, is the secretary of the former; and a letter addressed to the secretary of the French Horticultural Society, 27, Gerrard Street, London, W., would reach the latter.

GRAFTING MUSCAT VINES ON BLACK HAMBURGS: Grafting Vines. The proper time for doing this is the month of April. The scions, which should have a heel of two-year-old wood, should be about equal in size to the stock. And the method of grafting employed should be the side or slip graft, with or without tonguing.

FIG. 115.—VINE GRAFTING.

not employed to cover the entire scion, the lower end may be stuck into a pot of mould, and kept moist or inserted in a bottle of water (fig. 115). This is a successful method of grafting the Vine. Cleft grafting is sometimes employed, choosing a time for the operation when the sap in the stock begins in spring to flow freely—the scions should have been cut off and laid in moist soil two or three weeks previously.

privately say that out-of-doors Vines may be inarched—green shoots on green shoots—not later than just when the bunches of Grapes become visible, or the scion will not ripen its wood. Also grafts of last year's wood, with a heel of old wood, may be employed. These should be taken off in the late autumn, and the lower ends laid in soil in a cool damp cellar where there is no fluctuation of temperature. Before grafting them on the Vines in the spring, the butt-ends that have lain in the soil should be laid in water for twenty-four hours.

INSECTS: *J. K. H.* The soil contained the grubs of a species of weevil. Try what watering with lime-water will do for the soil. Before making use of the soil, hunt it over for the grubs. The perfect insects are very destructive to vegetation.

METEOROLOGICAL STATISTICS: *Hamish.* Enquire at the Meteorological Office, Victoria Street, Westminster.

NAMES OF FRUITS: *G. Southcott.* Your specimens are quite beyond recognition. All fruits sent for identification should be sound, and of fair sample.—*W. W. J. & Son.* Your Apple is probably Brabant Bellefleur.

NAMES OF PLANTS: *E. D. L.* 1, *Peristrophe speciosa* (Justicia); 2, *Cypripedium venustum*.—*E. C. L.* *Thuja dolabrata*.—*A. B.* *Ilex latifolia*.—*W. E. B.* *Anthericum lineare variegatum*.—*L. C.* *Rodriguezia* (Gomezia) *planifolia*.—*J. M.* 1, *Selaginella Willdenovii*; 2, *Selaginella Mertensii*; 3, *Polypodium aureum*; 4, *Cattleya Loddigesii*.

PARADISE STOCK FOR APPLES: *E. L. E. K.* This species of Crab or Apple is mentioned by Gerard about the middle of the sixteenth century; and according to a statement made by Pliny, it is supposed that it was introduced to Roman gardens in his time, but the place whence it came is not known.

PACKAGE.—A label has reached us from Rugby, with three halfpenny stamps upon same. The contents were lost during transit. Perhaps sender will see this, and kindly write us.

PEAR SHOOTS AND INSECTS: *C. Irvine.* The shoots are covered with the scale cases of the Mussel-scale (see fig 116). Washing with one wine-glass of petroleum to 1 gal. of soft warm water, and to which $\frac{1}{2}$ lb. of soft-soap is added, is to be

FIG. 116.—MUSSSEL SCALE.

recommended. See our leader on the subject of insecticides. The branches must be scrubbed. A smothering coat of clay, lime, cow-dung, and soot put on the tree at this time of year is also effectual. It may be followed with a second and a third to make sure.

ROMAN HYACINTHS: *J. R.* We must decline to publish anything from unknown correspondents who furnish us only with initials.

SPECIAL HORTICULTURAL PUBLISHERS: *Hamish.* There are none in London; Murray, Macmillan, Reye, Upcott Gill, and Cassell publish a good many works.

Come and See

OUR LOVELY CYCLAMENS and PRIMULAS. A tremendous way ahead of those usually seen.

CHRYSANTHEMUMS for the supply of cuttings are also glorious. A glance would convince all how necessary it is to get from those who do them properly. Our New Catalogue of the whole family will be posted to all interested next week.

H. CANNELL & SONS, SWANLEY, KENT.

SUPERIOR LEAF MOULD for Sale, in large or small quantities. Apply to THOMAS MILES, Epson.

500 GARDEN LIGHTS (new), strong framework, 3 by 2 inches thick, with iron bar across and painted, 3s. 11d. each. If glazed with 21 oz. glass, 8s. each. Also SPAN-ROOF FORCING-HOUSE for Brickwork (new), 50 by 10 feet, with 21 oz. glass and painted, £17. D. HOKKOCKS, Tyldesley, near Manchester.

HORTICULTURAL SHADINGS, NETTINGS, TIFANY, WADDINGS, COTTON WOOL for Packing Flowers, CANVAS, TWINES, &c., supplied wholesale by JOSEPH COOKSON, 21, New Cannon Street, Manchester.

The Original and Only Makers of the GENUINE RIVETED TRENTHAM BOILERS

With SOLID ENDS. Also—Silvester's patent Trentham With Special Provision for Cleaning the Inside thoroughly (a Most Important Point). These Boilers, after long experience, have proved themselves the Most Efficient, Economical, and Lasting Boilers extant. Every other kind of Boilers, Sockets, Flanges, and Expansion Joint Pipes and Fittings for all kinds of High and Low-Pressure Heating.

FRED SILVESTER & CO., General Engineers, Founders, and Boiler Makers, CASTLE HILL WORKS, NEWCASTLE, STAFFORDSHIRE.

THE IMPROVED GARDEN GULLY (VINCE'S PATENT).

This useful invention is a great improvement on the ordinary Garden Grating, and is especially suitable for hilly walks and drives. As they never get stopped by rubbish or sand they effectually prevent the washing away of the gravel in heavy storms, and they save half the labour in cleaning out the cesspools. The prices are:—

6-in., 1s. 6d.; 8-in., 2s.; 10-in., 3s.; 12-in., 6s. 6d. 15-in., 8s. (The larger sizes are very strong for carriage drives.) Full Particulars and Testimonials on application.

VINCE & VINE, 58, Chester Road, Upper Holloway, London, N.

"FRIGI DOMO" CANVAS. Made of prepared Hair and Wool, a perfect protection to all Plants, Blooms. Cheaper than any kind of mat, and will last for years.

To be had from all Nurserymen and Seedsmen.

FOR PRICE LIST & PARTICULARS ADDRESS BENJAMIN EDGINGTON & DUKE ST. LONDON BRIDGE.

BARB WIRE. CATALOGUES FREE ON APPLICATION TO THE LONGFORD WIRE CO. (LIMITED), WARRINGTON.

PEAT.—PEAT.—PEAT, For good Peat, apply to E. DURMAN, Petersfield, Hants.

ORCHID PEAT; Best Quality; BROWN FIBROUS PEAT for Stove and Greenhouse use. RHODODENDRON and AZALEA PEAT. Samples and Prices of WALKER AND CO., Farnborough, Hants.

RICHARDS' NOTED ORCHID AND OTHER SELECTED PEATS, Now Booking Orders for Splendid Stuff from A NEW CUTTING.

THOMAS GREEN & SON, LTD.,

LEEDS and LONDON,

HORTICULTURAL ENGINEERS to HER MAJESTY THE QUEEN, call Special Attention to their Patent Wrought-Iron Municipal or Angular Chambered and Tubular

HOT-WATER BOILERS,

And others with SHELVES, and HOLLOW or ORDINARY CAST-IRON GRATE BARS.

SADDLE BOILERS, With WATERWAY BACKS and WELDED BOILERS, any of which are specially adapted for Heating Greenhouses, Conservatories, Churches, Chapels, Schools, Public Buildings, Entrance Halls, Warehouses, Workshops, &c. They are the neatest, cheapest, most effective, and durable of any extant. The MUNICIPAL and TUBULAR ones are remarkable for their great heating power, slow combustion, and the length of time the fire will burn without requiring attention.

These Patterns secured the FIRST and HIGHEST PRIZE—a SILVER MEDAL—at the Royal Horticultural Society's Exhibition, South Kensington, London, June 1, 1881.

MUNICIPAL PATTERN BOILER, THE BEST EXTANT.

The longitudinal section gives a view of the fire-box, water space, flues, &c. The cross section gives a view of the fire-box, water space and V-shaped back. The front elevation shows it set in brickwork, which is necessary for this class of boiler.

TESTIMONIALS.

Re HEATING APPARATUS. Borough Engineer's Office, Municipal Buildings, Leeds, January 9, 1886.
MESRS. THOS. GREEN AND SON, LTD., NORTH STREET, LEEDS.
 GENTLEMEN.—I have great pleasure in bearing testimony to the efficiency and satisfactory working of the Hot-water Heating Apparatus you erected in these public buildings.
 The buildings are four storeys high, and we have a total length of about 28,000 feet of piping in them, varying in size from 1½ in. to 6 in. diameter, with their connections, &c. The several offices and rooms can all be in operation at one time or separately, and the heat regulated by means of the valves to the temperature required, even in the coldest weather.
 Two of your Patent Municipal Pattern Boilers, No. 4, work the whole of this piping easily, although we have three of them fixed. They are very powerful and economical in the consumption of fuel, and I am pleased to be able to report of them and the apparatus so favourably.
 I am, Gentlemen, yours truly,
THOS. HEWSON, Borough Engineer.
 Morley House, Bagot, St. Saviour's, Jersey, November 10th, 1886.
GENTLEMEN.—The large Municipal Boiler which you sent me last year is doing its work satisfactorily; it is heating 5000 feet of 4-inch pipe in one of my vineries, and I am quite sure that it has power to work a much greater length, while in cost of fuel it compares favourably with my other Boilers.
 I have now five of your Boilers in use, and I cannot speak too well of their heating powers, or their comparatively small consumption of fuel.
MESRS. THOS. GREEN AND SON, LTD., LEEDS.
 Yours faithfully, (Signed) **G. W. BASHFORD.**

And HUNDREDS OF OTHER REFERENCES CAN BE GIVEN IF REQUIRED.

 December 7, 1892. JNO. HARRISON, Town Clerk.

A FARMER and FRUIT GROWER will
 have a VACANCY at Christmas for a young Gentleman,
 as PUPIL, where he would be taught the Practical Work on
 a Mixed Farm, as well as Fruit Culture under Glass and
 Outside, for the London Market. A comfortable home.
 References given and required.—For terms, apply to FRUIT
 GROWER, *Gardeners' Chronicle* Office, 41, Wellington Street,
 Strand, W.C.

WANTED, a LANDSCAPE DRAUGHTS-
 MAN, to prepare Artistic and Working Plans for the
 Laying-out of Gardens, &c. The Draughtsman must possess a
 practical knowledge of Trees and Shrubs. Office hours
 seven per day. Salary £3.3s. a week.—Address, DRAUGHTS-
 MAN, Steel & Jones, Advertising Agents, Spring Gardens, S.W.

WANTED, a GARDENER, GENERAL
 FOREMAN.—Age not more than 35, single at first;
 for Cape of Good Hope. Must be thoroughly practical man.
 Fully understands Vegetable Growing. Wages to begin with,
 £7, and allowances in way of Lodging, Clothing, &c. Certi-
 ficate of health will be required.—Apply, by letter to ROBERTS,
 Post Office, Liphook, Hants.

WANTED, as DEPARTMENTAL FORE-
 MAN, a pushing man, in large Firm's Establish-
 ment, to Propagate and Grow well, Tree Carnations, Roses,
 Violets, and other Winter-flowering Plants.—Apply, stating
 particulars, age, wages, with bothy, milk, and vegetables, to
GARDENER, Gopnell Gardeos, Atherstone, Leicestershire.

WANTED, as GARDENER, for a moderate-sized garden, within 12 miles of London, a thoroughly good WORKING GARDENER, with a knowledge of Vines, Flowers, Fruit and Vegetables. Assistance is given. Married man without family preferred. Good character indispensable. Wages, 21s. per week with lodge and coals.—F. M., Leathwait & Simmons, 1, Pope's Head Alley, London, E.C.

WANTED, for a Nursery of 30 Acres, within 12 miles of London, a General OUTDOOR FOREMAN. A man of energy and experience is required, and one well up in the Propagating and Growing of Fruit Trees and Hardy Ornamental Trees.—Address A. Y., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

WANTED, a WORKING FOREMAN, for a small Market Garden; must have a good knowledge of Fruit Trees, and the successful growing of Tomatoes, Mushrooms, Cucumbers, Chrysanthemums, &c.—Apply stating age, references, wages, to J. G., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

WANTED, a FOREMAN, who thoroughly understands Growing and Forcing Cut Flowers for Shop. Good character indispensable.—Reply, A. G., 41, Wellington Street, Strand, W.C.

WANTED, a WORKING FOREMAN (Outdoor). Must understand the Propagating and Growing of Rhododendrons, Conifers, Clematis, Fruit Trees, &c., and the general routine of Nursery Work.—State experience, where recently employed, and wages expected, to HUGH DICKSON, Royal Nurseries, Belfast.

WANTED, a FOREMAN, for Glass for private place near London. A good Fruit and Plant Grower. Wages, 25s. per week. Address, with references, to NURSERMAN, Osman & Co., 132, Commercial Street, E.

WANTED, a first-class GROWER of Grapes, Chrysanthemums, Tomatoes, Roses, &c., for Market. Permanent situation.—State experience and wages required to W. R. ARMSTRONG, Florist, Elswick Road, Newcastle-on-Tyne.

WANTED, an active MAN, as GROWER and PROPAGATOR. Must be experienced in growing Cut Flowers for Market in quantity; also Bouvardias, Roses, and general Soft-wooded Plants. Permanent situation to a good man.—PARKER AND SONS, Nurserymen, Bristol.

To Fruit Packers and Gardeners.

WANTED, TWO young MEN, for Cape Colony.—Must understand Packing Fruit for Export, and have good references. Passage paid. Will have to sign indentures for three years. Liberal wages.—Apply, by letter only, to G. E. H., Suffolk House, E.C.

WANTED, a CLERK and BOOK-KEEPER. Applicants will please state age, experience, and wages required, to W. F. GUNN AND CO., Seed, Bulb, and Plant Merchants, 3, Stockton Road, Sunderland.

WANTED, an experienced, steady MAN, with some knowledge of the Trade, early in January, as LEDGER-KEEPER, &c., in a London Seed Merchant's Counting-house.—Address, CITIZEN, *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

WANTED, IMMEDIATELY, an active SHOPMAN for the retail Vegetable Seed Trade. Write, stating terms and references, H. H., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

WANTED, an experienced Young LADY, for a Florist's Shop. London suburb.—Full particulars by letter to FLORIST, Arthur L. Bullen, 33, Exeter Street, London, W.C.

WANT PLACES.

RICHARD SMITH AND CO. beg to announce that they are constantly receiving applications from Gardeners seeking situations, and that they will be able to supply any Lady or Gentleman with particulars, &c.—St. John's Nurseries, Worcester.

Gardeners, Farm-Bailiffs, Foresters, &c.

DICKSONS, Royal Nurseries, Chester, are always in a position to RECOMMEND MEN of the highest respectability, and thoroughly practical at their business. All particulars on application. Telegraphic and Postal Address—"DICKSONS, CHESTER."

F. SANDER AND CO. can recommend several highly qualified and energetic HEAD and UNDER GARDENERS, of excellent character, and proved ability; men thoroughly fitted for all the various duties of their profession. For all particulars, please apply to—F. SANDER AND CO., St. Albans.

GARDENER (HEAD).—W. B. FISHER, Gardener to the EARL CAWDORE, Stackpole Court, Pembroke, will be pleased to recommend Charles Davies to any Lady or Gentleman who is in want of a first-class man.

GARDENER (HEAD).—Age 37, married, no young children; an experienced man is thoroughly recommended.—GARDENER, Lindley Hall, Nuneaton.

GARDENER (HEAD, or good SINGLE-HANDED).—Age 39, no family; thoroughly experienced in all branches. Has had great experience in Growing Vines and Plants together. Seven years in present situation, five and a half and ten years previous.—HOBBS, Elstree, Herts.

GARDENER (HEAD).—Age 35, married.—Mr. W. SWAN, Gardener and Steward to J. P. Bryce, Esq., Bystock, Exmouth, can with every confidence recommend a thoroughly practical man conversant with the requirements of a large establishment and all things pertaining to Horticulture.—First-class Orchid Grower and General Plantsman. Highest possible character.

GARDENER (HEAD).—Age 35, married; highly recommended. Eight years Head, Orchids, Fruit, Plants, Vegetables, Park, &c. Eighteen years' experience. State wages.—SMITH, 10, New Road, Woolstone, Hants.

GARDENER (HEAD), or Management of Gentleman's Place with a view to paying.—ADVERTISER seeks engagement as above.—WRIGHT, Reid, 52, Dropshort, Aylesbury, Bucks.

GARDENER (HEAD), age 30, married.—J. HUNTER, gardener to the Earl of Durham, Lambton Castle, Fence Houses, can with every confidence recommend his late Foreman, Frederick Taylor, to any Lady or Gentleman in want of a thoroughly capable gardener.

GARDENER (HEAD); age 30.—J. DUMBLE, Gardener to Sir Charles Phillips, Bart., Picton Castle, Haverfordwest, is desirous of recommending his General Foreman, H. Butcher, to any Lady or Gentleman requiring a thoroughly competent man. He has a good knowledge of the different branches of Gardening, is well acquainted with the Cultivation of Fruit (Indoor and Out), Flowers and Vegetables, is also a good hand at Table Decorations.

GARDENER (HEAD).—G. NORMAN, Gardener, Hatfield House, Herts, desires to recommend his principal Foreman, Henry Sensecull, a good all round Gardener, and a steady, reliable Man. He was previously at Mentmore; Mr. Smith, Gardener there, will also be pleased to recommend him.

£5 BONUS will be given for information leading to Advertiser's appointment as HEAD GARDENER, where five or more are kept.—Age 40, single, till suited; twenty-four years practical experience. Highly recommended.—W. BARNES, Himley Hall Gardens, nr. Dudley.

GARDENER (HEAD WORKING).—Would Lay-out New or Remodel Old Place; trustworthy, intelligent, and thoroughly practical; single, abstainer, high testimonials.—J. H., 60, Gordon Place, Kensington, S.W.

GARDENER (HEAD WORKING).—Thoroughly experienced in Vines, Pines, Cucumbers, Melons, Stove and Greenhouse Plants, and Flower and Kitchen Gardens. Eighteen years in present situation. Leaving through death of employer.—THOMAS COOPER, Hurts Hall, Saxmundham.

GARDENER (HEAD WORKING).—Age 29; one child, aged five years; thirteen years' experience in good gardens; good testimonials.—F. WELLS, 29, Hampstead Road, Dorking.

GARDENER (HEAD WORKING).—Thoroughly experienced in growing Grapes, Peaches, Melons, Tomatoes, Cucumbers, Stove and Greenhouse Plants, Kitchen Garden, also Growing and Staging Roses for exhibition. Excellent character.—GARDENER, Mrs. Cook, West Bergholt, Botolph's Hill, Colchester.

GARDENER (SECOND, or SINGLE-HANDED).—Age 21; thorough experience both Outside and under Glass. Good character.—C. RICHARDSON, Railway Cottages, Boreham, Chelmsford, Essex.

GARDENER (SECOND), where three or four are kept.—Age 23; eight years' experience Inside and Out. Good character.—F. UPTON, Grange Cottage, Warming-Id, Hayward's Heath, Sussex.

GARDENER (Scotch).—Age 30, unmarried; first-prize Grape and Peach Grower. Highest testimonials from last situation.—GARDENER, Fues, Bannockburn, N.B.

GARDENER (UNDER).—Age 23, married.—Mr. BROWN, Capel Manor, Horsmonden, can thoroughly recommend a Man for Kitchen Garden and Pleasure Grounds, good hand with Scythe and Machine. Six years' experience. Strong and willing.

GARDENER (UNDER).—Young man (age 19), for the past three years indoor servant, desires situation under Gardener, thoroughly to learn routine of Gardening. Active and willing. Christian. Abstainer. Highly recommended by present employer.—JORDAN, Wesleyan College, Richmond, Surrey.

GARDENER (UNDER).—Age 27; twelve years' experience Inside and Out. Can be highly recommended. Abstainer.—T. MUSSELL, The Gardens, Few Park, Emsay, Oxon.

FARM BAILIFF; age 32.—R. MILNER, Penrice Castle Gardens, Swansea, would be pleased to recommend a practical Man as above. Exceptional references.—Apply in first instance to above address.

FOREMAN.—Age 26. Mr. C. DENNING, Ash Grove Gardens, Sevenoaks, wishes to recommend Albert Grubb as above. Has been with him at Holme Lacy, Hereford, and Ash Grove six years, Foreman last two years, and has always given the greatest satisfaction in every respect.

FOREMAN (ROSE, FRUIT, or GENERAL), or GROWER.—Age 30; situation wanted abroad. Well up in Rose, Fruit, and general Nursery Work. Quick and successful Budder and Grafter, Inside and Out. Has been with good firms.—Wages and particulars to—W. T. G., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

FOREMAN, where two or more are employed in the Houses.—G. JONES, Branston Hall Gardens, Lincoln.

JOURNEYMAN, Inside, or Inside and Out.—Age 22; both preferred.—F. FALCOMBRIDGE, 6, Sea View, Grange Town, Sunderland.

JOURNEYMAN (FIRST).—Thoroughly experienced in general Routine. Six years' reference from good Gardens.—SEALY, Northfield, Tetbury, Glos.

JOURNEYMAN, Inside and Out.—Age 20; excellent experience; four years in last situation. Active and willing; strong and healthy. Good references and character.—M., 9, Woodville Terrace, Alexander Road, Hornsey.

JOURNEYMAN (SECOND), in the Houses.—Age 18; four years' experience Inside and Out. Good character.—S. TROTT, Yew Tree Cottage, Crawley, Sussex.

JOURNEYMAN, in the Houses; age 22.—Mr. S. A. WOODS, O-berton Gardens, Worksop, will be pleased to recommend J. Allsop as above. Two years in present situation.

IMPROVER, in the Gardens.—I can highly recommend a strong, willing young man (age 19); strictly temperate.—HEAD GARDENER, Machen House, Newport, Monmouthshire.

IMPROVER, Outside, or Inside and Out.—Age 18; good character from previous situations.—C. TOWNSEND, The Gardens, Sandhurst Lodge, Wellington College Station, Berks.

IMPROVER, in the Houses.—J. BOWLER, Caldecote Gardens, Nuneaton, will be pleased to recommend Albert Jebbett, age 20, who has been employed in the Gardens here three and a half years, chiefly Outdoors. Is steady, industrious, and obliging. Shall be pleased to answer any enquiry.

IMPROVER, a young man, as above, in a Private Garden, where three or four are kept.—Age 18. Abstainer. Four years' good character from Toddington Orchard Company.—J. WHITE, Park Gardens, Toddington, Winchcombe, Gloucestershire.

IMPROVER.—Situation wanted by a Man in a Gentleman's garden or first-class Nursery as above. Two years eight months' good character from nursery and West End Florist.—C. K., 2, Lime Villas, Avenue Road, Bexley Heath.

TWO GARDENERS, &c.—Lad, age 18, seeks engagement in a Gentleman's garden or nursery. Not been in nursery before; had little experience in garden. Two years and half in last place. Good references.—W. RITE, Staines Road, Twickenham.

TWO GARDENERS.—A young Man seeks situation as IMPROVER in a large establishment; age 20; strong, active and willing; good testimonials; premium given.—R. GOODBOURN, 34, Old Dover Road, Canterbury.

TO SEEDSMEN.—Advertiser seeks situation in a Seed Shop. Used to Bulbs, Packing, and General Work. Good reference.—A. B., 2, Alfred Place, Store Street, W.C.

TO SEEDSMEN, &c.—I offer my services for the season to any firm requiring extra assistance. Clerk or Counter.—J. ADAMSON, Mr. Craenen, 21, Rue Van Artevelde, Brussels.

TO NURSERYMEN and FLORISTS.—Re-engagement desired by young man (age 21). Experienced Wreath hand. Six years' good experience as Grower under Glass. Highest references.—FLORIST, *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

TO GROWERS and OTHERS.—Advertiser requires employment as SALESMAN. Market hours only. Per term or otherwise.—H. G. C., 59, Nightingale Road, Wood Green, N.

CLERK.—Age 28; twelve years in one of the leading Seed-houses in England (at present Chief Clerk), seeks improvement.—W. T., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

Seed Trade.

SHOPMAN (ASSISTANT). Age 23.—Six years' experience in all Departments. Good references.—A. J. McLAREN, Messrs. Laing & Mather, Seed Merchants, Kelso, N.B.

SHOPMAN (ASSISTANT).—Age 19; five years' experience. Abstainer. Excellent character.—G. WELLS, Wavertree Nurseries, near Liverpool.

SHOPMAN.—Age 25; upwards of ten years' experience. Abstainer. Good references.—T. B., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

HOLLOWAY'S PILLS.—In general debility, nervous tremor, and mental depression, these unrivalled Pills have a marvellous effect. They have won the confidence of millions in all parts of the civilised world. Constitutions shaken by sensual excesses, or by long residence in unwholesome climates, or by sedentary habits, are wonderfully renovated by a course of this extraordinary medicine, which, powerful as its action on the whole system, is perfectly harmless to the tenderest frame. The Pills are composed of rare balsams, without the admixture of a grain of any mineral whatever, or of any other deleterious substance. They operate directly, powerfully and beneficially upon the whole mass of blood, nor can we question the fact when we see indigestion cured, other complaints arrested, the oppressed lungs brought into healthful play, and every physical function renewed and strengthened by their agency.

AWARDED TWENTY PRIZE MEDALS

AT INTERNATIONAL EXHIBITIONS AT HOME AND ABROAD.

KEITH'S PATENT BOILERS, THE "CHALLENGE," "VIADUCT," "PYTHON," &c.,

FOR HOT-WATER HEATING, "STAND FIRST," require no building work round them, are entirely water-jacketed, and heat from 50 feet up to 20,000 feet of 4-inch pipe respectively. Many thousands are in use all over the world, and the Boilers are unrivalled in power and economy.

KEITH'S "PYTHON" BOILER, as illustrated below, has 1000 square feet of effective heating surface, with 17½ square feet of fire-grate area; heats about 20,000 feet of 4-inch pipe, and is the Most Powerful and Complete Sectional "Special" Hot-water Heating Boiler in the World.

This Engraving "illustrates the most powerful form of Boiler that has yet been made for Hot-water Circulation."—Extract from Hood, on *Warming by Hot-water*, New Edition, 1891.

KEITH'S BOILERS

are almost exclusively used by Her Majesty's Government, at the Home Office, and for the Heating Work of the Prisons throughout the United Kingdom, in preference to all others.

KEITH'S PATENT
RAMS &
Self-acting,

HYDRAULIC
RAM-PUMPS,
For Raising Water.

The very HIGHEST EFFICIENCY attained in Self-acting Hydraulics, by KEITH'S RAMS.

KEITH'S PATENT "UNIVERSAL" RADIATORS,
For Hot-Water Heating. Made in One Piece, and in many Sizes and Modifications. No Joints to Leak. Thousands in use.

Manufactured under thirty James Keith's Patents in Great Britain, United States, and Canada.

JAMES KEITH (C.E., Assoc. M.Inst.C.E.), Gas, Hydraulic, Heating, Ventilating, and Consulting Engineer. Established 1823

THOMAS GREEN & SON, LTD.,

LEEDS and LONDON,

HORTICULTURAL ENGINEERS to HER MAJESTY THE QUEEN, call Special Attention to their Patent Wrought-Iron Municipal or Angular Chambered and Tubular

HOT-WATER BOILERS,

And others with SHELVES, and HOLLOW or ORDINARY CAST-IRON GRATE BARS.

SADDLE BOILERS, With WATERWAY BACKS and WELDED BOILERS, any of which are specially adapted for Heating Greenhouses, Conservatories, Churches, Chapels, Schools, Public Buildings, Entrance Halls, Warehouses, Workshops, &c. They are the neatest, cheapest, most effective, and durable of any extant. The MUNICIPAL and TUBULAR ones are remarkable for their great heating power, slow combustion, and the length of time the fire will burn without requiring attention.

These Patterns secured the **FIRST and HIGHEST PRIZE—a SILVER MEDAL**—at the Royal Horticultural Society's Exhibition, South Kensington, London, June 1, 1881.

MUNICIPAL PATTERN BOILER, THE BEST EXTANT.

— FRONT ELEVATION — — LONGITUDINAL SECTION — — SECTIONAL PLAN —

The longitudinal section gives a view of the fire-box, water space, flues, &c. The cross section gives a view of the fire-box, water space and V-shaped back. The front elevation shows it set in brickwork, which is necessary for this class of boiler.

TESTIMONIALS.

Re HEATING APPARATUS. Borough Engineer's Office, Municipal Buildings, Leeds, January 9, 1886.

MESRS. THOS. GREEN AND SON, LTD., NORTH STREET, LEEDS.

GENTLEMEN,—I have great pleasure in bearing testimony to the efficiency and satisfactory working of the Hot-water Heating Apparatus you erected in these public buildings.

The buildings are four storeys high, and we have a total length of about 28,000 feet of piping in them, varying in size from 1½ in. to 6 in. diameter, with their connections, &c. The several offices and rooms can all be in operation at one time or separately, and the heat regulated by means of the valves to the temperature required, even in the coldest weather.

Two of your Patent Municipal Pattern Boilers, No. 4, work the whole of this piping easily, although we have three of them fixed. They are very powerful and economical in the consumption of fuel, and I am pleased to be able to report of them and the apparatus so favourably.

I am, Gentlemen, yours truly, THOS. HEWSON, Borough Engineer.

Morley House, Bagot, St. Saviour's, Jersey, November 10th, 1886.

GENTLEMEN,—The large Municipal Boiler which you sent me last year is doing its work satisfactorily; it is heating 5000 feet of 4-inch pipe in one of my nurseries, and I am quite sure that it has power to work a much greater length, while in cost of fuel it compares favourably with my other Boilers.

I have now five of your Boilers in use, and I cannot speak too well of their heating powers, or their comparatively small consumption of fuel.

MESRS. THOS. GREEN AND SON, LTD., LEEDS.

Yours faithfully, (Signed) G. W. BASHFORD.

And HUNDREDS OF OTHER REFERENCES CAN BE GIVEN IF REQUIRED.

Seed Growers
CHESTER.

VICTOR POTATOS
(SHARPE'S).

This favourite first early Potato, suitable for any Garden, indispensable for Forcing and Early Borders, and likely to take the first rank amongst first earlies for market use. Quality and yield all that could be desired. One well known market grower has this year had a yield of 15 tons per acre on a large acreage. London and Manchester salesmen speak highly of their quality, and report that Victors will keep their bloom and have a fresh appearance after being in the market some days, when other early Potatos have become discoloured and unsaleable.

The stock we offer is the true yellow-fleshed variety and not the white variety, which is often substituted.

Price per cwt. and ton. State requirements to

W. W. JOHNSON & SON,
Seed Growers and Merchants, Boston, Lincolnshire.

ANTHONY WATERER

Invites an inspection from intending Planters to the following well-grown TREES, having stout, clean stems, with handsomely-furnished, well-balanced heads, and from frequently transplanting are splendidly rooted; the girth of the stem is taken at 4 feet from the ground:—

- ACER DASYCARPUM, 14 to 20 feet, girth 4 to 8 inches.
- " " WIERI LACINIATUM, 10 to 14 feet, girth 3 to 5 inches.
- " " NEGUNDO VARIEGATUM, Standards, 3 to 10 feet.
- " " REITENBACH, 12 to 14 feet, girth 4 to 5 inches.
- " " SCHWEDLERI, 12 to 18 feet, girth 4 to 8 inches.
- " " WORLEYI, 12 to 14 feet, girth 3 to 5 inches.
- ASH, Mountain, 12 to 14 feet, girth 4 to 5 inches.
- BEECH, Purple, Pyramids, and Standards, 10 to 20 feet, girth 4 to 9 inches.
- BIRCH, Silver, 12 to 14 feet, girth 3 to 5 inches.
- CERASUS SEROTINA (American Bird Cherry), 12 to 16 feet, girth 6 to 7 inches.
- CHESTNUTS, Horse, 14 to 20 feet, girth 6 to 11 inches.
- " " Double White, 14 to 16 feet, girth 6 to 8 inches.
- " " Scarlet, 12 to 18 feet, girth 4 to 10 inches.
- " " Spaish, 12 to 14 feet, girth 4 to 5 inches.
- ELMS, English, 10 to 12 feet, girth 3 to 6 inches.
- " " Guernsey, 16 to 18 feet, girth 7 to 9 inches.
- LIMES, 12, 16, and 20 feet, girth 3 to 10 inches.
- " " EUCHLORA or DASYSTYLA, 12 to 14 feet, girth 4 to 6 inches.
- " " Silver-leaved (Tilia argentea), 12 to 14 feet, girth 5 to 6 inches.

THE

Gardeners' Chronicle.

SATURDAY, DECEMBER 24, 1892.

PERFUMES.

THE principal mode by which cholera and other allied diseases are transmitted is, undoubtedly, drinking water. But at the same time infection is also carried amongst organic particles in dust and air to the mouth and respiratory organs of the body. It is, therefore, important to surround those organs with an antiseptic atmosphere. Now, it is not yet fully appreciated in England, although well known from experience in the east, that perfumes, vegetable scents, and sweet odoriferous plants, possess energetic antiseptic qualities. Many among us are wont to laugh at what we too often deem an effeminate taste for scented handkerchiefs and sachets, but from time immemorial the usefulness of pungent and sweet odours has been handed down by tradition, custom, and reputed knowledge. It may not, therefore, be out of place to quote some details regarding the curious action of odorous essences which have recently been published by M. Henri de Parville in the scientific column of *Les Annales Politiques et Littéraires*, of Oct. 23, 1892.

The ancients were wont to make great use of the antiseptic qualities of essences. The examination of mummies proves that the Egyptians well understood and recognised their efficacy. Czermack when examining two mummies, buried at least three thousand years ago, found the bodies so well preserved that he could recognise fragments of their intestines under the microscope. He found that the principal procedure employed for embalming consisted in the introduction into the interior of the body, of aromatic powders, of balm, of several resins and pure essences, and in the application of bandages soaked in gums and saturated with various essences. It was these essences which preserved the bodies. This is so well proved that Dr. Hunter has succeeded in embalming bodies and mummifying them by injecting into the arteries a solution of Venetian turpentine* (Térébenthine de Venise) in essences of Lavender, Rosemary,† and Camomile. The essences, moreover, formed the base of the principal dressings and ointments which were used by the medical physicians of antiquity, from the days of Hippocrates, Celsus, Galen, Aetius, down to Ambrose Paré and Fabricius d'Aquapendente. Two physiologists of Lyons, Mons. Cadéac and M. Albin Meunier, whilst searching amidst the chaos of the ancient pharmaceutical writings of the

* Pistacia terebinthus; called in Italy terebiato.

† Rosmarinus officinalis, of the Mediterranean, from which eau-de-Cologne, Hungary water, and Vinaigre-au-quatre-voleurs are manufactured.

ancient writers, have found in the composition of the theriacal mixture and recipes of Andromachus,* or ascribed to him, all the drugs whose virtues have been vaunted by the old doctors and extolled even by the poets. This celebrated electuary contained fifty-four substances known by the empirical methods, then in vogue, as being the most active and efficacious. This medicine has been used for centuries, and was even regarded by the savant, Bordeu, as the supreme remedy (*le remède par excellence*). It is, in fact, composed of sulphate of iron, opium-powder, some other doubtful substances, and forty-two active aromatic substances, in their essential form; the essences have, therefore, been the antiseptics of the Egyptians, the Greeks, and the Romans, whilst even at the present day aromatic plants form the basis of popular medicine.

MM. de Cadéac and Meunier have studied lately, in their turn, the physiological action of essences, and by their experiments have arrived at some interesting conclusions, which may be commended to the notice of our gardeners and all horticulturists.

The antiseptics and disinfectants most commonly used have been examined by these experts comparatively. The most powerful is corrosive sublimate, which destroys the microbes of typhoid fever in ten minutes. Ether saturated with iodine, kills the microbes in thirty-six hours. The solution of sulphate of copper takes nine days to kill the same microbe, so also the solution of phenic acid in the same time; boric acid in eleven days.

On the other hand, essence of Cingalese Cinnamon kills the microbe in twelve minutes; that of Cloves in twenty-five minutes, of Thyme in thirty-five minutes; of Vervain (*Verbena officinalis*) in forty-five minutes, of Geranium in fifty minutes, of Origan, or Cretan Dittany, in seventy-five minutes; of patchouly of Hindostan in eighty minutes; of absinthe in four hours, of sandal-wood in twelve hours; thus, the essence of Cinnamon is microbicide to the extent of killing the typhoid fever microbe almost as quickly as the most potent of our modern antiseptics, in twelve minutes against ten. The comparison with the solutions of phenic acid, boric acid, &c., is all in favour of the essences. Several of them hasten the evolution of the microbe after several hours; whilst our modern antiseptics delay the action for several days.

The Cinnamon from Ceylon takes the first place, and it was extensively employed by the Egyptians in their embalming processes, and it enters into the composition of the theriacal compound. Thyme and Wild Thyme (*Serpolet*), *Thymus Serpyllum*, the Pell-a-mountain of Britain, were long been utilised in popular medicine by the doctors of old. Vervain is still used in the form of tea. The Origan had great renown in the heroic times of Greece as a wound salve. Virgil mentions it in his *Aeneid*, lib. xii.

Many other essences are antiseptic, but their action on the microbe of Eberth is more or less slow, and requires from one to several days. For instance, Juniper takes 27 hours, Balm (*Balsamodendron opobalsamum*) 30 hours, Valerian 32 hours, Orange 32 hours, Angelica 35 hours, Celery 36 hours, turpentine 45 hours, Opopanax 45 hours, Rose 46 hours, Camomile 48 hours; even ether and iodine solution only kills the microbe in 36 hours; and, therefore, it is less efficacious than the Juniper, which was employed by the ancient Egyptians for em-

balming. Turpentine, Orange, and Valerian all enter into the composition of the old-world theriacal medicine.

Incense (the fragrant gum of the *Boswellia serrata*, or *thurifera*) only kills microbe in fifty-two hours, yet it is more active than the solution of sulphate of copper. The *Calamus aromaticus*, which kills in four or five days, has a superior effect to that of the solution of phenic acid. MM. Cadéac and Meunier have thus passed in review all the most notable essences. At the same time, it will not do to forget that the antiseptic influence varies with the microbe. Nevertheless, the most active essences appear to have the same action generally in regard to most species of microbe. Thus, Cinnamon kills the microbe of glanders after fifteen minutes of contact, exactly in the same time that corrosive sublimate acts on the same microbe. But Cloves, Thyme, Serpolet, Vervain, &c., which follow, require rather more time than phenic acid. The nature of the microbe varies their comparison.

In their experiments, MM. Cadéac and Meunier operated by bringing the microbe in contact with the essence. (What would our anti-vivisectionists say to this?) It therefore becomes necessary to inquire whether the antiseptic power of the essences has like efficacy when administered in the form of vapour. It is plain that for practical use in medicine it is far easier to expose the respiratory channels to vapours than to actual contact with the essence. To respire vapours of essential oils is easy, and a microbicidal atmosphere is readily produced (as gardeners who smoke their greenhouses will be the first to perceive). The experiments carried out in this direction by M. Chamberland meet this inquiry. This savant has demonstrated that the vapours of an essence have actually the same antiseptic qualities as the essence itself in direct contact. This fact is one of singular importance.

M. Henri de Parville goes on to conceive the possibility of composing a modern theriac which will be endowed with a general or universal disinfecting and antiseptic power, against which all microbes would in vain try to exist. In this speculation, however, we cannot follow him. Enough has been said to show that we must not despise the use of the scent-bottle; and also that the cultivation of aromatic plants in the manner of our forefathers, which has fallen into desuetude, and become unfashionable in these so-called degenerate days, may well occupy the attention of our horticulturists at a time when the cholera bacillus and microbe is within a measurable distance of our coast line, and repeatedly entering into our seaports. *S. Pasfield Oliver, Captain, late Royal Artillery, Moray House, Stokes Bay, Gosport.*

NEW OR NOTEWORTHY PLANTS.

ASYSTASIA VARIA, N.E. Brown, n. sp.

This is a greenhouse herbaceous plant, belonging to the order Acanthaceae, remarkable for its variable foliage, the leaves varying in form from ovate to long and broadly linear, and are usually more or less variegated; the flowers are of moderate size, pale mauve, with dark veins. It was discovered in 1888 in Zululand by Mr. J. M. Wood, the Curator of the Botanic Garden, Durban, Natal, who saw it only in one place; seeds were sent to Kew, from which plants were raised, and the following description made from them.

Plant 9 to 10 inches high, with numerous herbaceous, obtusely 4-angled, pubescent stems, arising from a woody rootstock. Leaves opposite; petioles $\frac{1}{2}$ to $\frac{3}{4}$ inch long, pubescent, connected at their bases

by a transverse line of hairs; the blade is 1 to 4 inches long, $\frac{1}{2}$ to 1 $\frac{1}{2}$ inch broad, varying on different plants from elliptic-ovate to linear or linear-lanceolate, obtusely pointed, cuneate or rounded at the base, bright green, with a pale variegation along the midrib; the upper surface has a few short hairs scattered between the veins, and the midrib on both sides, and the veins beneath, are more or less hairy; the margin is slightly sinuate. Racemes $\frac{3}{4}$ to 2 $\frac{1}{2}$ inches long, terminal, 4 to 8 flowered, the peduncle, pedicels, and sepals, all densely clothed with gland-tipped hairs. Bracts minute, subulate. Pedicels 2 to 2 $\frac{1}{2}$ lines long. Sepals 2 $\frac{1}{2}$ to 3 lines long, lanceolate-subulate, very acuminate. Corolla-tube 1 $\frac{1}{2}$ inch long, curved, pubescent, the lower half slender, the upper half rather abruptly and broadly dilated, convex above, flattish, with two broad and shallow grooves beneath; the limb of the corolla is about an inch in diameter, two-lipped, with five nearly equal, broadly ovate, obtuse lobes, 4 to 5 lines long, the middle one of the lower lip being broader than the others; the inside of the corolla is entirely glabrous, the colour is pale mauve, prettily veined with dark purple-brown. Stamens four; the anthers are two-celled, one cell placed higher than the other, acute at the apex, obtuse at the base. Ovary stipitate, minutely pubescent or glabrous, seated on a whit-swollen disk. Ovules two in each cell. Fruit 1 inch long, including the $\frac{1}{2}$ -inch-long stipes, the seed-bearing part compressed, pandurate from being constricted between the seeds, and there is a deep groove on each side running lengthwise between the seeds; the apex has a short, blunt beak. A native of Zululand. *N. E. Brown, Herbarium, Kew.*

ORCHID NOTES AND GLEANINGS.

CATTLEYA LEOPOLDI, PERNAMBUCO VARIETY.

UNDER the above name, a plant which flowered out of an importation which the collector had advised Messrs. Sander & Co. as being entirely composed of the species now known as *C. Victoria Regia*, was exhibited at the last meeting of the Royal Horticultural Society. Since then I have seen several far finer examples, which seem to indicate that, as a variety, it will be distinguishable from the old type by their flowering in a smaller state, by the rich ladian yellow ground, to the dark reddish-brown sepals and petals. The side-lobes of the lip are white or blush-white, the front-lobe carmine-crimson more or less broadly margined with white. The flowers are very sweet. *J. O'B.*

LELIA ANCEPS ALDA.

It is gratifying to find this shy-flowering section of Orchids responding liberally in the matter of flower-spikes on being placed in full sunshine. Last year, the first season they were grown in their present position, our plants threw three spikes, and this season there are seven. Grown previously in partial shade they grew splendidly, but evidently more sunshine was needed to mature the pseudo-bulbs, and induce flowering. We are looking forward with interest to those now flowering for the first time. The common forms are very useful at this time of the year, and the white ones doubly so. *Jas. Brown, Arildarroch, Gareloch Head.*

VANDA AMESIANA.

Few, if any, of the recently-introduced species of Orchids are more useful than the above for producing cut flowers in winter. The plant is of dwarf compact habit, not growing more than a foot high, with semi-terete leaves, and so slow is their development, that not more than half-a-dozen of them are made in one season's growth. The flowers, which are very fragrant, are produced on racemes from 18 inches to 2 feet in length, are of a delicate rose colour, or sometimes deep purple in the centre, shaded off to a pale pink or white at the outer margin of the petals. When the plants are strong and in good health, the lower part of the flower-spike is paniculated for about half its length, and from three to

* Andromachus was physician to Nero, and author of a theriac or compound medicine long in repute.

four such racemes are produced from the axils of the leaves made the previous summer. When such is the case, the individual flowers, too, are larger—from 1 to 1½ inch across—and have more substance in them than when the plants are unhealthy. For cultivation as a plant to produce cut flowers, it has few equals, as they stand well after being cut if not subjected to a hot dry atmosphere. For decorative purposes, either in the conservatory or drawing-room, it would be hard to surpass. I have grown this species in several houses, and find that an intermediate temperature suits it best. The East-Indian house is too hot, for there the growth gets drawn, and in a cool-house the thick fleshy roots damp off. It delights in a sunny place in the intermediate-house, where a free circulation of air can be permitted. Potted in crocks and charcoal, with a little sphagnum on the surface, it seems at home. The winter temperature may range from 45° to 60° Fahr., so that for a warm conservatory mixed with Ferns it looks charming. *B. P.*

As it is, the commercial importance of Cola-nuts in the West African Colonies is very great, and will become more so as the continent is opened up. Hitherto, in this country, Cola has been looked on rather as a drug than as an article of dietary; but Mr. Christy deserves commendation for his efforts to introduce it as an alternative for Tea or Coffee.

It is claimed for it, that while lacking the injurious qualities of the former substances, it is as palatable as they are, and more nutritious. Cola is recommended as a beverage for all whose occupations subject them to long abstinences from food, as it is not merely satisfying, but sustaining. The sample that we have seen is a favourable one, the flavour is suggestive of that of Cocos, but with a slight additional bitterness. For soldiers on the march, or for labourers especially in tropical countries, it would be most valuable. Cola is described by Dr. Masters in Oliver's *Flora of Tropical Africa*, vol. i., p. 220, from which we take what follows:—

"It varies very much in the size and form of the

to is of entirely different nature, being the seeds of a *Garcinia*, described and figured, so far as the imperfect material would allow, by the present writer, in the *Journal of Botany*, March, 1875, p. 66, t. 160. It is rather a curious coincidence that the embryo, both of the Cola and of the *Garcinia*, should be of anomalous character. Neither the one nor the other is referred to in the bibliography to Sir John Lubbock's *Seedlings*, although numerous figures exist.

TRAINED YEWS AT ABERGLASNEY, CARMARTHENSHIRE.

THE accompanying illustration represents a remarkable avenue or bower of trained Yews at Aberglasney, a quaint Jacobean mansion and garden belonging to Mr. Lloyd Phillips. The avenue is formed from a single row of Yews, the branches of which are carried over in an arch-fashion from the left, as seen in the illustration, and planted in the earth on the right, from which position numerous branchlets spring up from the ground obliquely. The effect of the bower as viewed on the spot is delightful, a peep of the old garden being seen at the end of the avenue. Similar work with trained Yews has on former occasions been illustrated in the *Gardeners' Chronicle*, as in the well-known and remarkable work at Hatfield called the Vinery, and the beautiful Lime bower at Rothamsted; in all instances the trained Yews are associated with Jacobean or Elizabethan mansions.

At Aberglasney, there is a small but remarkable old piece of gardening close to the house and Yew bower. There is a moderately large quadrangle in front of the windows; in the quadrangle, a large stone-bordered pool of water has been formed, with a fountain, aquatic plants, and gold fish in the centre. On three sides of the quadrangle there is a kind of covered walk, under a stone roof, supported by stone columns, with a stone balustrade above. Curiously enough, a second broad walk, with garden beds as borders, is carried over the walk below, so that persons from the trim garden above can look down on to the trim garden with its cool water and fountain below.

The whole effect of the place is delightful, beautiful, and curious. It requires but little effort on the part of a wanderer in this charming garden of old times to people the place once more with the gentlemen and pretty ladies of Jacobean times.

RHODODENDRONS.*

(Continued from p. 712.)

HYBRIDS.

The number of hybrid Rhododendrons that have been raised in England is exceptionally great. The species generally cross freely with each other, and ripen seeds abundantly under cultivation. There are limits, however, to the "blends," even among Rhododendrons. Thus, no one has yet crossed any of the forms of *Azalea indica* with any other species of the genus; some profess to have done it, but there are no positive proofs. Nor have the Malayan species been crossed with any other than their own kind. Many of the Sikkim species refuse to intercross. On the other hand, some very remarkable crosses have been made, quite as astonishing as anything that could be expected.

Dean Herbert raised various hybrid Rhododendrons at Spofforth, and his remarks upon them in his classical paper on "Crosses and Hybrid Intermixtures in Vegetables" are well worthy of perusal. According to him the first hybrid in this genus was the result of an accidental cross between *R. ponticum* and a hardy *Azalea* in the nursery of Mr. Thompson, at Mile End. This hybrid is still popular in gardens, and is known as *R. azaleoides*, *R. odoratum*, &c. There are two very large beds of it at Kew. It has a compact habit, is sub-evergreen, and bears loose heads of the most fragrant lavender

* A paper read before the Kew Gardeners' Society, by W. Watson, Assistant-Curator.

FIG. 117.—TRAINED YEWS AT ABERGLASNEY, CARMARTHENSHIRE.

COLA.

TEA, Coffee, Cacao, Guarana, Cola, Coca, are all known as restoratives, and are used in various parts of the world as refreshing beverages, or are used for the purpose of enabling the partaker to endure prolonged abstinence from food, or unusual physical exertion. No doubt all the substances we have named have that power.

Which is preferable is pretty much a matter of local convenience, custom, and prejudice. The essential ingredient in almost all, if not all, is the alkaloid thein, or caffeine. Certainly not the least efficient are the West African Cola-nuts, which contain a larger proportion of alkaloid than Cacao or Coffee. These are the seeds of a Sterculiaceae tree, *Cola acuminata*, not far removed, botanically speaking, from the Cacao. Many species of *Sterculia* would, no doubt, furnish seeds of equal value, and as they can be cultivated in most tropical regions, it is highly desirable that their culture should be extended. Towards the promotion of that object much has been done at Kew, so that from the West Indies alone a supply of Cola could now be derived.

leaves and flowers, the appearance of the pods, the colour of the seeds, and even in the presence of from two to five separate and distinct cotyledons. Whether these variations depend upon cultivation or not, it is not easy to decide; whether or no, numerous intermediate gradations between the different forms may be traced. The number of cotyledons varies even in seeds taken from the same pod. Barter says that the nuts with four cotyledons are not so much prized as those with two, in the native markets. Karsten gives an admirable figure of the plant, but not having the fruit, he mistook it, and constituted of it a new Terebinthaceous genus. The tree has been introduced into the West Indies, South America, &c., the form usually cultivated being the broad-leaved, large-flowered one. The name Cola or Kolah seems to be also applied to several other Sterculiaceae seeds, but those of *C. acuminata* and its varieties are those most prized in the native markets. The 'Bitter Cola' of Fernando Po is the produce of some other tree, some *Guttifera*."

The cotyledons of the true Cola when fresh, as in the case of some specimens received by us a short time since, are of a beautiful coral-pink colour, but this is lost in drying. The Bitter Cola above referred

and white flowers. Loddiges, Lee & Kennedy, Standish, the Waterers, and Veitch's, among the nurserymen, and the Earl of Liverpool, Earl of Carnarvon, and Herbert among amateurs, were among the first to interest themselves in the cross-breeding of *Rhododendrons*. In more recent times, we have had the late Mr. Mangles, Davies of Ormskirk, I. Anderson-Henry, Luscombe, Cunningham, Noble, and, of course, Messrs. Veitch and Anthony and John Waterer, all of them more or less specialists in the work of *Rhododendron* breeding. The following are some of the most interesting hybrids hitherto raised, with their parentage:—

R. arboreum	...with R. catawbiense	R. Russellianum.
"	" " " R. caucasicum	R. venustum.
"	" " " R. maximum	R. Cunninghamii.
"	" " " R. ponticum	R. altaclearense, &c.
R. Aucklandi	... " R. arboreum	not named, Kew.
"	" " " R. Hookeri	R. kewense.
"	" " " R. John Waterer	(not named).
"	" " " R. album elegans	R. Manglesii (fig. 122, p. 767).
"	" " " R. ponticum	R. Alice Mangles
R. Thomson	... " R. Fortunei	R. Luscombei
R. Edgeworthii	... " R. formosum	(not named).
"	" " " R. multiflorum	R. Countess of Derby.
R. Nuttallii	... " R. Dalhousiei	(not named).
R. Dalhousiei	... " R. ellipticum	R. Countess of Haddington.
"	" " " R. formosum	R. Henryanum.
"	" " " R. Nuttallii	R. Victorianum.
R. ellipticum	... " R. Edgeworthii	R. Princess Alice
"	" " " R. virgatum	R. multiflorum.
"	" " " R. dahuricum	R. praeox (fig. 124, p. 771).
"	" " " R. glaucum	R. Wilsoni.

"	" " " R. ponticum	R. Etandard de Flandres, and other various kinds.
R. virgatum	... " R. Prince C. de Rohan.	R. floribundum.
R. hirsutum	... " R. punctatum	R. myrtifolium, Lodd.
R. linearifolium	... " R. indicum (Azalea)	(not named).

Messrs. J. Veitch & Sons have raised about one hundred and fifty distinct kinds from the several Malayan and Javan species named above.

The double-flowered forms, called *balsaminiflorum* (fig. 123, p. 769), were obtained by self-fertilising a flower which showed a slight tendency to doubling. Of the fifteen plants raised from the seeds, some were single-flowered, some semi-double, and some perfectly double. The name *balsaminiflorum* has also been given to a form of *Azalea indica*. W. W.

(To be continued.)

TRANSPLANTING TREES, B.C. 1600.

We are indebted to Mr. W. Lee, of the firm of Charles Lee & Son, the Royal Vineyard Nurseries, for the following interesting communication:—

Miss Amelia B. Edwards, in her valuable book, *Pharaohs, Fellahs, and Explorers*, furnishes an account of the transport of trees 3500 years ago, that proves once more the truth of Solomon's assertion, that there is nothing new under the sun.

Queen Hatshepsut, whose throne is now in the British Museum, reigned at Thebes as sole monarch for about sixteen years. The most remarkable event of her reign was the despatch of a fleet of sea-going ships to the land of Punt, a region identified with that part of the Somali country which is situated on the eastern coast of Africa, bordering the Gulf of Aden.

The fleet is conjectured to have made its way down the Nile from Thebes to Cairo, thence through the Sweet Water Canal to the Bitter Lakes, and through the older Suez Canal into the Red Sea.

There are a great number of wall paintings, showing the expedition, but our first will be taken from the landing in Punt. The ancient draughts-

man, in one of the very few known examples of Egyptian landscape art, has carefully depicted for us the characteristic scenery (fig. 118) of the unknown country to which the squadron has made its way. The ground is flat, and thickly wooded, the conical huts of the inhabitants being built on piles, and approached by ladders. A cow reposes peacefully in the shade of a tree to the right, and a bird, known by its characteristic tail feathers as the *Cinnyris metallica*, wings its flight towards the left. Of the five trees represented, two are conventional renderings of the Date Palm. The trunks and branches of the other three are most carefully drawn. An enclosing line carried round each indicates the outline of the foliage, the details of which are left to the imagination. We are here on the banks of a river; the three last-named trees exactly reproduce the odoriferous Sycamore which grows on the borders of rivers. The water is painted green, which may be taken to indicate a tidal river, green being the Egyptian colour for sea water, and blue for fresh water. The fishes, too, are not the fishes of Egypt.

The tableaux form a continuous scene (fig. 119). In our next we see the Egyptian sailors carrying half-grown saplings which have been taken up, with a ball of earth about the roots, and are being transported in baskets slung upon poles, each pole carried by four men. These are accompanied by natives of Punt, some carrying large logs of Ebony, others leading apes. A running commentary of short inscriptions is interspersed here and there between the figures. "Stand steady on your legs, Bohu," says one of the bearers. "You throw too much weight on my shoulders," retorts Bohu.

Over the saplings which are being carried in baskets is inscribed *Nebet Ana*; that is to say, the Sycamore of Ana. Elsewhere we see the full-grown trees. The trunk is massive, the leaf is a sharp-pointed oval, and at the junction of the trunk and the larger branches are seen little copper-coloured lumps of irregular form, representing the resinous gum which has exuded through the bark.

A passage in Pliny shows that this tree, the odoriferous Sycamore, can be none other than the Myrrh tree, whose gum was brought by the ancients from the so-called land of the Troglodytes. According to the old naturalist, the Myrrh tree is found "in many quarters of Arabia; also there is very good Myrrh brought out of the Islands; and the Sabæans pass the seas and travel as far as to the Troglodytes country for it. The plant groweth ordinarily five cubits high, but not all that length is it smooth and without prickles; the body and trunk is hard and writhen; it is greatest towards the root, and so ariseth smaller and smaller taperwise. Some say that the bark is smooth and even, like unto that of the Arbut tree; others again affirm that it is prickly and full of thorns. It hath a leaf like to the Olive, but more crisp and curled, and withall it is in the end sharpe pointed like a needle. The Myrrh trees are twice cut and lanced in one year, the slit reacheth from the very root up to the boughes, if they may bear and abide it."

Further on he says that, of all the wild kinds of Myrrh trees, "the first is that which groweth in the Troglodytes country;" and this, "the Troglodytike Myrrh, they chuse by the fattinesse thereof, and for that it seemeth to the eye greener. The best Myrrh is known by little peeces which are not round; and when they grow together, they yeeld a certain whitish liquour which issueth and resolveth from them, and if a man breake them into morsels, it hath white veines resembling men's nails, and in tast is somewhat bitter."

That the ana was undoubtedly the resinous gum of the Myrrh tree is confirmed by the passage from Pliny, which describes it as of a green colour, the green ana being constantly named in Egyptian inscriptions as the most precious and desirable kind.

In the next illustration we see the Egyptian sailors, some carrying the saplings (fig. 120) in baskets slung from poles as before, others laden with big jars, and all hurrying on board along inclined planks. The decks are already piled high

with their precious cargo, among which may be observed three large apes, who make themselves perfectly at home. Slung to the main-mast of the nearest vessel a harp is depicted, of a shape which may even now be seen in the hands of native musicians in Cairo and other large towns. The captain stands on the platform at the prow, issuing his commands, and, small as is the scale, the very natural action of the man in front of him, who shouts the order with his hand to his mouth, must not be overlooked.

Our last tableau shows a row of Sycamore saplings in tubs, with (fig. 121) an inscription, stating that "thirty-and-one growing trees of the Ana were taken at Punt to the holiness of the god Amen. Never was there seen the like since the world began."

The illustrations and text are derived by Miss Edwards from Mariette Bey's work, *Deir-el-Bahari*, being a temple immediately across the Nile, opposite Karnak.

CHRISTMAS FLOWERS.

ANYONE visiting the Christmas market at Covent Garden will naturally wonder where are grown the immense quantities of delicate flowers, plants, &c.—many of which, ere they have left the market, show signs of exposure to a smoke-laden, deleterious atmosphere—and who are the growers? A visit to a similar establishment to that of Mr. Icton's, in Putney Park Lane, S.W., would enlighten these inquisitive persons to a large extent—at any rate, as regards the trade in Lily of the Valley, Roman Hyacinths, Tulips, Azalea mollis, and Palms. All of these are grown in amazing numbers, and the quantity in bloom upon any day the visitor may call is such that would interest even those initiated into these things. When admiring a house full of Lily of the Valley in perfect bloom, the breath of which will seem to cling to us long after the festive season is past, we inquired what number Mr. Icton usually forced, and were told about 2,000,000, and sometimes more. Of course, this quantity is spread over a considerable time, the first being ready for market early in the month of November; but at Christmas it is usual to have a very large lot ready for sale. We are far from saying that the forcing of Lily of the Valley is not a paying business even now; but on the other hand, the exceedingly high prices realised a few years ago, are now no longer to be obtained—a necessary consequence of the law of supply and demand, which soon adjusts one to suit the other. In those early days, all manner of experiments were tried in order to make the crowns produce flowers with greater readiness, one of which was to artificially freeze the crowns and clumps of those desired for this purpose, and this particular method was found to be very helpful. We believe, however, that it would not pay unless the price to be realised by the blooms was exceptionally high; but at the same time, Mr. Icton does everything he can to encourage them to freeze naturally in the open air, before lifting them to the forcing-house.

Of Roman Hyacinths, there was also a wonderful display, several houses containing masses of the snow-white blooms. About 200,000 of these are forced annually at this place. Tulips, again, were present in thousands, and we were told that of the scarlets, there were forced 140,000. These scarlet Tulips have a wonderful effect at Christmastide, when perhaps—though it appears unlikely in the south this season—the ground is covered with snow. But the yellow and white are not forgotten, for there are ten varieties here, and in all there will be forced a million and a half. These Hyacinths and Tulips are forced in boxes and pots, the larger proportion in the former, and a number of these small square boxes were being got ready for Covent Garden, all of which were in bloom. Some of the pots had both Tulips and Roman Hyacinths growing therein, and we were told that many persons preferred them in this way.

The next thing that deserves mention is the batch of Azalea mollis—for the management always secures a good number of these plants at this season,—upwards of 7000 of which will be disposed of, and needless to say, when such a number is passed through an establishment, exceptionally delicate and charming shades are met with. Of *Lilium longiflorum* and *longiflorum* var. *Harrisii*, about 30,000 are grown, and just now many of these are about 1 foot high, looking stout and well.

PALMS, &c.

The number of Palms grown for the trade is constantly increasing, and several new houses on the ridge and furrow principle have been lately added. Anyone who has not seen these can hardly be expected to form an idea of the quantity in stock, which is enormous. Of course, these consist for the most part of *Kentias*, *Cocos*, and such species as will stand plenty of knocking about, and are therefore fit for market work, and furnishing. No room is given to other and rarer plants that may be equally elegant, but not of such accommodating disposition. The greater number of Palms are of such size adapted for sale in large quantities to the

brightened by the seasonable presence of Holly and Mistletoe.

Passing through the aviaries with their melodious occupants, we come to the fruit department, in which the Grapes are specially fine, and so on to the vegetable department, which draws its supplies mainly from Whiteley's 200-acre fruit and vegetable farm at Hanworth, near Twickenham, in which operations on a still larger scale are in prospect, and the great army of 6000 employes and about 500 horses, which Mr. Whiteley regularly keeps on, will have to be greatly increased.

But where do the flowers and plants which make the display come from? will be a question

ing condition, and here and there climbing Roses are planted, whose flowers will come in well in aiding the supply of Tea Roses planted under glass, and which are intended chiefly for winter and spring work.

The walls enclosing the plant-houses have along them a large number of store-rooms, seed-room, bulb-rooms, workshops, stables, pottio-g-sheds, cart-sheds, sheds for storing flower-pots, soil, &c.; and on one side runs a Mushroom-house, some 200 feet in length, the four beds in which, running the entire length, are a wonderful sight, the earlier-spawned being in full bearing, others following in succession, the last spawned just showing through being quite equal to the others. The produce, too, is of the

FIG. 118 (SEE P. 762).

FIG. 119 (SEE P. 762).

growers, but there are also many—kept in houses erected specially for their accommodation—of a larger size, and these are used for furnishing, many very good specimens we noticed amongst these. Greatly interesting is it to hear from a grower like Mr. Icton, of the varying tastes of customers, how many plants have been the rage of the hour, and growers have had their tact and resources tried to the utmost in meeting the demand, which some are now like unfashionable garments, left coldly alone. The demand for *Araucaria excelsa* is still as great as ever, and we noticed many hundreds of these which had just been struck from cuttings taken from seedlings. These plants from cuttings are much more useful for decoration than are the

which will certainly suggest itself to anyone with a knowledge of the ordinary sources from whence such supplies are drawn, for there is a freshness and beauty about both flowers and plants at Whiteley's very different from the crumpled appearance of similar articles found in shops which are dependent on market produce. The unusually long stalks and quantity of foliage to the flowers, which can only display themselves to advantage when gathered with long stems, are very different from the bunches of flowers of the same kind seen in ordinary shops, which are supplied from the market, and which are often cut shorter than they need be for the sake of uniformity. To us the matter is no secret, for a visit to that flower, plant, and fruit

best quality, for the Mushrooms here have the delicate character of the field Mushroom, and are not of the coarse quality which some spawn gives. About 300 lb. weight per week is the present gathering, and the supply is increasing.

Along other sides of the quadrangle run ranges of Vineries, extending some 1000 feet, and planted with Muscat of Alexandria, Black Hamburg, Gros Maroc, Black Alicante, Gros Colmar, and other favourite Grapes. The quality of the bunches yet hanging is excellent, and the promise for next crop good. When the Vines get older, and Mr. Bethell has had the opportunity of putting his handiwork on them, an immense supply will be forthcoming. Other houses are under the walls, and among them

FIG. 120 (SEE P. 762).

FIG. 121 (SEE P. 762).

seedlings themselves, which often have a bare stem of several inches from the soil.

CHRISTMAS FLOWERS AT WHITELEY'S.

It will be sufficient to say that the flower department at the great establishment at Westbourne Grove is worthy of it and its far-seeing proprietor.

On reaching the flower and plant department, a fine sight greets us, the brightly-tiled floor which leads through the centre and up to the seed and horticultural sundries division being banked on either hand by groups of brilliant scarlet *Poinsettias*, of bushy *Erica hymalis*, of neat plants of white Roman Hyacinths, white and coloured Azaleas, of stately white Callas, scarlet Van Thol Tulips, and other plants of the season, admirably arranged with Palms, *Dracenas*, Ferns, &c., by Mr. Fortescue, the chief of the department. At the entrance is the making-up division, in which the making of bouquets, button-holes, wreaths, and crosses is in active operation; and around a great profusion of flowers used in the work and for sale as cut flowers, such as Orchids, Lily of the Valley, Violets, Eucharis, &c., the whole

manufactory, as it might be called, known as Whiteley's Nurseries, at Hillingdon Heath, near Uxbridge, gave us a full and sufficient explanation, and furnished us with material for notes, which will be interesting to our readers.

A sum of £40,000 has been spent on the 9 acres or thereabouts enclosed within the walls which surround the establishment, and the statement of that fact alone would indicate the importance of the concern. But beyond the mere outlay of money, a great amount of horticultural skill has been brought to bear on the work, and especially since the management has passed into the hands of Mr. G. Bethell, who has few equals in knowledge of the many-headed subject he has undertaken to manage, or in adroitness in carrying out the various operations necessary to make such a great business pay, and at the same time give good value to the purchasers of produce, for that was the idea which was paramount in Mr. Whiteley's mind when the venture was first started.

The plan of the nurseries is, that the whole is enclosed within high walls, and a similar wall runs across, dividing the fruit and vegetable garden from the glass department. The walls are furnished with Peach, Nectarine, and other fruit trees in fine bear-

in active work are those for forcing Rhubarb, &c.; and for the production of White Lilac, the plants of which are well set with bloom. A range of Peach-houses completes the square, and with the fruits obtained from them and from the other fruit houses it must be a great advantage to be able to supply produce, as it were, direct from the tree to the consumer.

About seventy long span-roofed houses, the woodwork of which was done by Messrs. Messenger & Co. and which are heated by eight Trentham boilers, form the central block of houses, and examination of their contents showed the wisdom of the things selected to be grown, and the quality, of the plants themselves. The rule here is that nothing which is not serviceable to the buyer shall be grown; nothing is admitted simply because it is easy to grow, and what is called "turns in" quickly. At Hillingdon, all things which experience has proved there is a demand for, are grown; and it takes in all from the ordinary double red and white Stock up to Orchids, and all the things cultivated are clean, healthy, fresh, and floriferous. The evidence of the finished plants of *Chrysanthemums* tell that there has been

a good show of them, and still the houses set apart for them are full of snowy-flowered *Chrysanthemums*—*Elaine*, cut back in order to have them late; the long house of *C. Princess Teck*, with some of their older flowers delicately tinged with rose; the handsome flowers of *C. Lady Lawrence*, and the rich colours of *C. Julie Lagravère*, and other kinds remaining, make a very grateful display at this season. Next week their heads will be off, but the object of their culture will have been accomplished, their purchasers will have received good lasting flowers first-hand, and the treasury of the concern will be so much the better. So also with *Lily of the Valley*, and white *Roman Hyacinths*, large quantities of each are grown, filling the houses with their beauty and fragrance; as soon, however, as they arrive at perfection, the insatiable establishment at Westbourne Grove claims them for distribution, and Hillingdon must hurry up the reserves.

Glancing through the long ranges of houses as we come to them, all aglow with flowers, or beautiful with the frondage of Ferns or rich tints of coloured foliage, we note some of the most striking batches. The first has a fine lot of *Cyclamen persicum* coming into flower, and a profusely-flowered lot of the old double white *Primula sinensis*, which is still the best one for such work; next comes a houseful of scarlet *Poinsettias*, with *Asparagus plumosus* on the roof; then a long range of double scarlet *Pelargoniums*, and another of white *Pelargonium*, Queen of the Belgians, covered with bloom. In these as in other houses space is economised by using the available room beneath the staging for starting Tulips and other bulbous plants for cutting, and in most of the houses there are shelves over the walks, and at the back of the staging, for small stuff, and for the growth of pot Strawberries for forcing, a very large quantity of which it is intended to fruit. Next come houses of single scarlet *Pelargoniums*, of white *Gardenias* planted out, of *Isolepis gracilis* and *Tuberose*s; of pot Vines, which are well and extensively grown; of Tomatos and of other things, and then we come to—

The Orchids, which of course, comprise only showy things, which are, and always will be in general demand, and especially such as are good for cut flowers. As in many new places, at first, the Orchids did not seem to go so well as they should do, but since Mr. Bethell has been able to give them his personal attention, they have made remarkable progress so that there is no fear of their culture being abandoned; indeed, such an establishment framed on such lines and for such a purpose as that at Hillingdon could not well do without them. There is ample convenience to meet the requirements of all classes of Orchids, and some of them which thrive best suspended in baskets or Orchid-pans occupy situations which would be barren without them. In such situations the *Dendrobiums*, of which there is a fine lot of the showy species, put on splendid growth last year. And so also with other genera—the last growth exhibits marked improvement, and fortells that but a little time is wanted to make them valuable specimens; meanwhile, they will pay well for their quarters by their periodical contributions of showy flowers. One long range is filled with *Dendrobiums*, chiefly varieties of *D. nobile*; another has *Laelia anceps*, *L. albida*, and *L. autumnalis*, many of them being in bloom, and in the same house some sturdy *Cattleya Trianae*, and noble plants of *Oncidium splendendum*, many of them sending up strong spikes. Then we come to some well-bloomed plants of *Zygopetalum Mackaili*, a large lot of *Cypripedium insigne* and scarlet *Anthuriums*. In another house are a grand lot of *Coclogyne cristata*, which it is desired to bring into bloom in succession. Many of these are grown on shelves near the glass, and thrive to perfection. In a warmer house are *Dendrobium Phalaenopsis Schroderianum* and other species of that class, and in the *Cattleya*-house a clean, well-grown stock of *C. Mendelii*, *C. labiata vera*, and all the other showy species. In a cool division the *Odontoglossums* give good warrant for the prudence of extending the culture of them, but the *Masdevallias*, although evidently improving, are the least promising feature.

Palms and foliage plants we next come to, and glancing through the neat long houses ranging right and left of the main walk we find thousands of *Kentias*, from the just sprouting seed (and of these there are many thousands pushing) to the neat table plant or large specimen for permanent use indoors; thousands of *Areca lutescens*, chiefly in a small state, and large quantities of all the other Palms usually grown for sale. In other houses are *Dra-*

cenas, *Crotons*, and other plants of beautiful foliage, especially handsome being the white and green India-rubber plant (*Ficus elastica variegata*); then we come to a houseful of *Adiantum cuneatum*, the favourite Maidenhair, and in other houses healthy young plants of the many Ferns which make pretty plants quickly.

As in a maze we pass through long ranges of Peach-houses, a fine house filled entirely with stately white Arums, a house of *Lilium Harrisii* and other Lilies, a house filled with feathery *Asparagus plumosus nanus* for cutting, a range filled with *Azaleas*, &c., for forcing, Cucumbers being in the roof; a house of *Lily of the Valley* which we could smell before we saw them; several Rose-houses, the one with the roof covered with *Niphetos*, and the other with *Maréchal Niel*; Strawberry, and other fruit-houses, &c.

Much pleased with our visit, we saw that, heavy as had been the outlay, properly handled, the investment was a good one; but, although Roses may be abundant there at times, the manager will never have a bed of them.

The trees and shrubs, and a large quantity of Palms, &c., are grown at Whiteley's Farm at Finchley, some 200 acres in extent, and the ground used for the shrubs being fresh broken, they put on good growth, but as they are frequently and carefully moved, they are always fit for sale, and are said to do duty for decoration or for town squares and gardens far better than do the trees and shrubs grown further in the country.

THE WEEK'S WORK.

THE ORCHID HOUSES.

By H. A. BURBERRY, *Orchid Grower, Highbury, Birmingham.*

DENDROBIUMS.—For the next two or three months *Dendrobiums* will be the most valued flowers in the Orchid-houses, if a large and long-continued supply of flowers is desired by the owner. Some species of *Dendrobium* are quite amenable to the orchidist in the matter of flowering at any time when he may want them from the present to the end of the month of March, and even later. This is accomplished without those dire results to the plants which follow when other species of Orchids are brought into flower much sooner or retarded much later than their usual time of blooming. In fact, to force Orchids with much warmth to produce early flowers always ends in failure, and should never be attempted; on the other hand, some species may be retarded for a few weeks without their ever showing the slightest injury from the process, and none better than the following good old species of *Dendrobiums*, viz., *D. nobile*, which must still be placed first as a very useful plant, although new varieties have of late years come to the front, some of which, viz., *D. n. Sanderianum*, *D. n. Cooksonii*, *D. n. nobilium*, and some others, have fine points. Some recent introductions are inferior to the type, and none grow so luxuriantly or propagate more freely. *Dendrobium heterocarpum* is another good old Orchid, and one on which some of the most successful feats of the hybridists have been carried out, viz., the crossing it with *D. nobile*, the result of which was a great variety of intermediate forms, the best perhaps of which at the present time is *D. splendidissimum grandiflorum*, and all of these are as easily managed as the parents. *D. Linawianum*, is a good species, and the parent of *D. Dominicanum*. Other members of this genus of easily-managed *Dendrobiums* are *D. japonicum* and *D. Findleyanum*, and the hybrids *D. Cassiope*, *D. Schneiderianum*, *D. endocharis*, *D. chryso-discus*, and *D. Cybele*, all of which are extremely useful for early or late flowering. There are some species of *Dendrobium* that are impatient of and suffer greatly if retarded in the least degree. These for the most part have been mentioned in my previous calendars, and the winter temperature for which should not be less than 60°. The deciduous species of *Dendrobium*, *D. Wardianum*, *D. crassinode*, *D. lituiflorum*, *D. Devonianum*, *D. Pierardii*, I am still keeping in a temperature of 40° to 50°, as I find that if these are brought in flower too early, the flowers are few and small; and the plants suffer. We shall now, however, select the earliest, and place them in an intermediate-house, hard forcing being always injurious. *Dendrobium McCarthiae* is a beautiful species, but it is one which is said to deteriorate under cultivation. It should be suspended in the warmest house winter and summer, and be not allowed to suffer from lack of

water. *Dendrobium albo-sanguineum* is another species that requires to be rested in a warm house. *Dendrobiums* of the bigbubum and *Phalaenopsis* sections are still making a good show of flower with us, but as they are now somewhat past their best, and others are coming in to take their place, it is advisable for the health of the plants that the remaining flowers should be forthwith cut off.

FRUITS UNDER GLASS.

By J. RIDDELL, *Gardener, Castle Howard, York.*

GRAPES AND THE GRAPE-ROOM.—This room should be thoroughly cleaned, washing the floor, putting bottles in order, and otherwise making it fit for the reception of the remainder of this year's Grapes, and being sure that all dampness is got rid of before these are placed in it. Select *Lady Downes' Seedling* and *Black Alicante* for the part of the room farthest from the door, as they keep to the latest period, and should therefore be the least influenced by external conditions of the air. Whenever it is practicable, sufficient wood should be left on every bunch to allow of it projecting deeply into the water in the bottles; and, in the case of large bunches, I would advise the splitting of the butt-end by cross-cuts. Carefully cut out every bunch-decaying berry, as only the soundest berries will keep in good condition till the spring. Maintain a dry atmosphere in the room when the work of storing is completed, and a temperature ranging from 45° to 50°. A dry air which has some movement is indispensable, in order that the water in the bottles, &c., which is constantly being evaporated, may be carried off. During rainy and foggy weather it will be wiser, however, to exclude the outer air altogether, and keep a gentle warmth in the hot-water pipes or flues. To safeguard the fruit through the spring months, a keen eye should inspect each bunch for decaying berries once a week at the least; the middle of the bunches is the part to be the more completely searched. The water in the bottles will require to be replenished occasionally. This item in the preservation of plump berries should be strictly attended to, or shrivelling of the berries will show itself.

LATE VINES, from which the fruit has been cut, may be pruned, and receive the cleaning that each individual case demands, vigorously following out former instructions regarding the extermination of insects commonly found on Vines, if these have been present on them. In pruning such varieties as *White Tokay* and *Black Barbarossa*, I would recommend the laying-in of this year's wood sufficient in quantity to supply the fruit for the coming year, that is, if big bunches be desired. If the borders in which these late varieties of the Vine are growing stand in need of a mere surfacing, a mixture of well-decayed leaves, Thomason's vine manure and basic slag, will form an excellent medium for the roots to ramify in. If liquid manure from the farmyard tank be largely employed during the growing season, a layer of old mortar or plaster should first be placed on the surface of the border, and then the above mixture added. Afford a good watering if the condition of the soil claims attention in this direction, and keep the atmosphere of the house as cool as circumstances will permit, with a view to giving the plants a decided rest.

THE FLOWER GARDEN.

By H. W. WARD, *Gardener, Longford Castle, Salisbury.*

ODD JOBS AND DELAYED OPERATIONS.—In frosty weather the accumulated rubbish-heaps of this and previous years should be turned over and mixed together, which will convert it into fairly good manure for dressing flower-beds and borders. A rubbish-heap should be situated in some out-of-the-way corner distant from the dwelling, and should consist of one heap, consisting of the fresh rubbish; one of a year older, which will be partially rotted; and, thirdly, one which is fit for present use. Composts used in the raising and potting of bedding-out plants should be prepared in due proportions—say, three-parts of waste or old potting soil, and one of leaf-mould. By turning this stuff over a few times in as many days, the exposure to frost will sweeten it, and destroy grubs, &c.

WALKS AND ROAD-MAKING, which in many low-lying places could not be got on with earlier, should, now the ground is firm, be proceeded with in earnest; and, for the same reason, gravel should be carted on to any walks requiring a coating of the same. The mulching of Rose-beds should now be performed, if not done sooner, putting on them a dressing 3 inches thick of good well-rotted manure.

PROTECTING TENDER SHRUBS.—Such plants as Myrtle and *Aloysia citrodora* (Lemon-scented Verbena) will be the better for a little protection being given them in most counties, excepting a few favoured spots in the South of England and Ireland. A few inches thick of sifted coal-ashes placed over the roots, and a mat or two over the branches (if trained against a wall or fence) at night will prevent their being injured by frost. If grown in bush form, as is frequently the case, the branches can be tied together, and dry Fern or Bracken worked among and over the shoots, and then tied and trimmed into a pyramidal shape, thus making them secure from frost for the whole winter.

IVY ON TREES.—While the growth of Ivy is to be encouraged only on the trunks and branches of decayed and decaying trees, young ones must be cleared of it if these are to grow into large specimens. After the Ivy is severed at the base of the trees with a hatchet, it may be torn down.

BEDDING PLANTS.—Protect from frost all kinds of bedding plants requiring protection, and ventilate the pits, frames, and houses freely on every favourable opportunity.

THE KITCHEN GARDEN.

By G. WYTHES, *Gardener, Syon House, Brentford.*

EARLY SOWINGS OF VEGETABLES.—A bed of tree leaves, when obtainable, or of stable dung and one-third spent hotbed materials, should now be made, or at least the materials mixed thoroughly together, slightly wetted with manure-water or other if too dry, and made into a conical heap to ferment, previous to being used in the making of the bed early in January. The appliance made use of may be a garden frame of one or several lights, or a brick pit having some means of affording top-heat. On this mild hot-bed, which should have a bottom-heat of not more than 80°, and top heat of 60° to 62°, sowings may be made, in boxes or broad shallow pans, of the earliest Cauliflowers, Cabbages, Lettuces, and Onions. Where very large quantities are thus raised, one or several lights are devoted to each kind, boxes and pans being dispensed with, and the seed sown on fine rich soil, spread over the bed, and made firm and level. Failing frames and pits, these early sowings may be made in hothouses having the proper warmth, taking great care to place the pans, &c., as soon as the sprouting of the seed has taken place, near to the roofing glass, to prevent drawing. Frames will require linings, and at night mats or litter must be used to cover them, airing being freely done in fine weather. When the plants are ready, prick them off into other frames, or boxes and pans. Excellent kinds and varieties are the Paris Market Sprout, Veitch's Earliest of All Cabbage, Pearl Cauliflower, and Golden Queen Lettuce.

PEAS AND BEANS.—These seeds, if they have been sown as advised in an earlier Calendar, will need to have some soil drawn up to them for shelter as soon as the plants appear above the soil, and some Fir twigs, &c., stuck in to break the force of the wind; and if birds are troublesome netting will be wanted. The rows may be mulched with spent Mushroom-bed materials. Some good early varieties of Peas should now be sown in pots, and placed in a temperature of 45° to 50°, watering the soil very sparingly at first and until sprouted. These will be found of use for planting out if very severe weather should injure those which were sown in the open.

SPINACH.—This crop has suffered in my locality from the too abundant rains, and it will be advisable to assist the earliest crop with a slight dressing of sifted wood ashes, to which one-fourth part of guano or fish manure is added, and then slightly hoeing the ground when it is dry enough.

AUTUMN-SOWN ONIONS will require similar treatment to the Spinach as regards surface-dressing, and a good treading between the rows of plants. If the latter are wintering badly, lift and replant them on another warm border, which should be prepared with dressings, soot or wood-ashes, and be trodden firmly.

CABBAGES.—The plants have, so far, stood well, but it will happen that the plants suffer greatly from east winds later in the winter, and some means should be taken to preserve the earliest lot, these being the greater sufferers. I would advise, as a means to that end, a thorough treading of the soil and rather high moulding, doing all this kind of work in dry weather. Later successions may be similarly treated if of good size.

CAULIFLOWERS.—Those planted in frames or standing pots should be very well ventilated when-

ever there is no actual frost, but defended from heavy rain. Plants under hand-glasses and cloches will require occasional dressings of wood-ashes and soot, to check the ravages of slugs.

TOMATOS will now be making but little progress, and the plants which fruit in the spring should be kept quiet, with a very limited supply of water at the roots. Plants having ripening fruits should be afforded warmth of about 60° at night and 70° by day; and it will be found good policy to perfect these advanced fruits rather than attempt the difficult task of setting more blossoms. If manure is afforded plants with advanced fruits, it should be in weak doses. Seed may now be sown, but there is little to be gained by early sowing, unless the means at command are of the best.

THE HARDY FRUIT GARDEN.

By H. MARKHAM, *Gardener, Merecorth Castle, Maidstone.*

COBS AND FILBERTS.—In parts favourable to nut-culture, few, if any, other crop pays better for the growing than nuts, which always fetch very good prices, and the nuts keep sound for a comparatively long time. Nut bushes will grow in almost any kind of soil which is not heavy in texture or heavily manured. Much manure in the soil causes the growth of very strong wood, which rarely fruits well. Provided the soil is of good depth, and consists of fertile loam, let it be trenched, and, if not in good heart, some well-decayed manure should be put into the trenches. Nuts should have a southerly, sheltered aspect; north and east winds being warded off by means of hedges, walls, or plantations. Nut bushes are usually increased by means of suckers, which are, before being planted, brought on in the nursery. They should be dug up with roots attached, the top cut back in such a manner that the main shoots or framework of the bush will spring from a point at from 12 to 14 inches from the ground. In some Kentish fruit-gardens, nuts are grown under Apples and other tall-growing fruit-trees, and the crop of nuts, in such cases, is fairly good; but an open spot is the better. When planted amongst tall-growing fruit-trees more space must be allowed between the latter, so that the nut bushes may obtain direct sunlight to ripen the wood and the fruit. When in a plantation by themselves, 10 to 14 feet apart is the proper distance to plant, doing this firmly. The ground must of course be kept clean, and all root-suckers removed from bushes that are not of mature age.

TRAINING.—If the suckers taken from the old bushes are too weak to be shortened the first year, it should be done the second season, and the resulting shoots (four or five) allowed to grow without stopping. The following year cut these shoots to 15 inches in length, and to an outside bud, and repeat this pruning annually, except that, as time goes on, there will be a number of weak shoots, which must be spurred back to a few buds, and as the bushes extend themselves, leave other secondary branches. The nicest form for a Filbert bush is the basin, and its height need not to exceed 8 feet. The loose soil under old bushes on which the caterpillar was troublesome last summer, should be raked from about the stems, and charred, re-filling it with fresh soil from the alleys, or from a distance; and if manure be needed, which will be the case if signs of weakness are visible, apply manure, but do not let this be overdone, nor yet apply fresh farmyard manure—woollen rags and fur-waste are better manures, and these are mostly made use of in Kent. Dig the alleys between the bushes only just deep enough to bury the weeds, removing all suckers. Where there are many acres of nuts, pruning may be taken in hand. In doing this, shorten back all leading shoots. Remove strong, useless wood, sawing out limbs where there are many, and spurring back medium-sized shoots, to form fruiting-wood. With this kind of treatment plenty of nut-bearing twigs will result. Young bushes, which have not reached their proper height, should not be shortened too severely, and leave plenty of male flowers.

FORESTRY.

By J. B. WEBSTER, *Forester, Stangmore, Dungeness.*

FELLING AND MARKETING TIMBER.—As house-building and railway requirements are fairly satisfactory, and likely to continue so for some time, there will be no great difficulty in most parts of disposing of the felled timber at remunerative prices when it is of good quality. Saw-mills have been, and still are, pretty busy, and as the price for good, sound timber exhibits a firm tendency, the outlook,

on the whole, is encouraging. I regret, however, to notice that there seems to be a prejudice in some quarters against the use of home-grown timber for house-building, as well-seasoned foreign timber, for all particular purposes, is generally preferred; but there are a great many purposes in connection with house-building where the timber does not require to be seasoned, or even of mature growth, such as lathing, concrete frames, dividing posts, and all purposes where lime comes in direct contact with the wood, as it is found that this mineral preserves the timber for an indefinite length of time, whether old or young.

In a paper before me, I see the following rules laid down by the Board of Agriculture in their specifications, as to the selection of timber: "In all cases where Fir timber is used, that obtained from Memel or Norway, and battens from Drain, St. Petersburg, or other Norway or Baltic ports, is to be preferred; but if not procurable, the best quality of American red Pine only may be substituted; or, if specially allowed by the Board, Larch, or home-grown Fir, may be used, if thoroughly sound and well-seasoned, in which case the age, size, and growth of the trees must always be specified." Now, these restrictions are of by far too general a character, as I have already noticed some of the timber used for building purposes does not require to be of matured growth and seasoned, as the following illustration will show. From the year 1853 up to 1859, I supplied the whole of the home-grown timber for the various purposes in connection with the new castle and other buildings at Balmoral, and the wood was neither of mature growth, nor seasoned when used for the purposes already specified, and I never heard the inspector of work make any complaint about the timber. The trees were all fine clean spars, cut in the natural Pine forest, and averaged about 12 inches in diameter at the butt end. When the wood was cut up at the saw-mill, it was carted direct to the castle, and at once used in its green state by the plasterer and other tradesmen. This shows that young green wood can be used for a variety of purposes in connection with house-building. I should, however, mention that the wood used for the making of windows, doors, flooring, and all particular purposes was well-seasoned foreign wood. But my experience and observation tell me that good sound Scotch Fir of mature growth is not inferior when properly seasoned to the best Memel and Baltic Pine, and may be used for all purposes in connection with house-building with safety.

We cannot grow timber-trees of a similar size to what we get from foreign parts, but mere bulk is not a safe criterion by which to judge of quality, and I maintain that clean grown home timber of mature growth when properly seasoned can be used for every purpose on country estates. During my experience of carrying out estate improvements in Great Britain and Ireland, I have had occasionally to pull down and remove old and dilapidated houses, sometimes the timbers of which were Oak, and sometimes Scotch Fir, and occasionally both kinds of wood mixed together; and although in some cases the houses were of such an age that no one could tell me when they were built, yet the timbers were quite fresh, of a brownish colour, and as hard as horn. I think this is pretty good proof that the lasting qualities of the British Oak and native Scotch Fir are of no mean order, and it shows that the wood of both kinds of trees may be used with advantage. I know some estates where the best of the wood has been sold off and turned into cash, and the inferior trees used for estate purposes, supplemented perhaps with foreign wood for particular purposes. One great drawback to the use of native Pine-timber is the number and size of hard knots to be found in the trunk of some trees when cut up for use. Carpenters do not like Scotch Fir on this account, as it is harder to work, and they say they cannot make such a fine finish as with foreign wood, and I dare say that there is a good deal of truth in this; but then wood of this kind is the exception, and not the rule, and in all cases where the trees have been well handled during the different stages of their growth, the wood is not only free from knots, but when cut up exhibits a close and uniform grain capable of taking on as smooth a polish as glass, which renders it highly ornamental. This I think should stimulate planters to thin their Pine-woods in such a way that the side branches will gradually lose their vitality and fall to the ground of their own accord, and the stems will then exhibit fine clean shafts free of knots or blemish of any kind, and surmounted at the top with a canopy of evergreen branches and spray.

EDITORIAL NOTICES.

LETTERS FOR PUBLICATION.—All communications intended for publication, as well as specimens and plants for naming, should be addressed to the Editor, 41, Wellington Street, Covent Garden, London. Communications should be WRITTEN ON ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

PLANTS, &c., TO BE NAMED.—Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week. Specimens should be carefully packed and numbered, and not more than six should be sent at one time.

NEWSPAPERS.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

LOCAL NEWS.—Correspondents will greatly oblige by sending the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

ILLUSTRATIONS.—Photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c., are particularly solicited.

Advertisements should not be sent to the Editor, but to the Publisher.

APPOINTMENTS FOR THE ENSUING WEEK.

SALES.

THURSDAY, DEC. 29. { Roses and Bulbs, at Protheroe & Morris' Rooms.
{ Plants at Stevens' Rooms.

SATURDAY, DEC. 31.—Plants at Stevens' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—37° 6.

A VERY important meeting of the members was held on Tuesday last, to consider the proposed new rules for the guidance of the Society. Mr. HARRY VEITCH made a thoroughly business-like chairman, and while courteous to all, and willing to receive suggestions from any source, yet so contrived to push on the business, that the work of revision was got through in less than three hours, although a glance at the programme would lead to the inference that two or three such sittings would not have more than sufficed for the due carrying out of the work. The only objection we can raise is the short time the members had to consider the matter before the meeting. The document was, in our own case, received on Saturday night, and the meeting took place on Tuesday. There was thus not only no time for anyone with his other avocations to consider the matter properly, but it was quite impossible to communicate with members of the Society in the country. The general excellence of the work done, however, may well give rise to doubt whether, if longer time had been given for consideration, the result would have been materially better.

The revision of the rules was rendered necessary to bring them into conformity with the requirements of the Registrar under the Friendly Societies' Act, and hence some proposed amendments were perforce negatived. All through, the meeting had the assistance of the Hon. Solicitor, Mr. PEACOCK, who clearly explained points as they arose, and who has laboured evidently for a considerable time to bring the rules within the limitations laid down by Act of Parliament. The rules were taken *seriatim*, each one being voted upon by the members. Many of the old rules are, of course, retained without

alteration, and on these but little discussion took place; others were modified or expanded, and these, together with numerous entirely new rules, were thoroughly discussed before the vote was taken on each. Members of the Society in the country may then be fully assured that the most careful consideration was given to the matter. The general tendency of the amended rules is to render the Society more secure, to facilitate its method of working, and extend its benefits. No doubt there is still much that is unduly conservative and old-fashioned, and much that is no longer in harmony with the spirit of the times; but reforms in a Society like this are dangerous things, and need to be introduced with caution, lest they do more harm than good. The committee has given testimony that it is awake to the necessity of rendering the Society more popular than it is with the average gardener; and now that a beginning has been made in the way of broadening the work of the Society, and adapting it more fully to the requirements of modern gardeners, we may hope for more rapid progress in the future.

With the fullest sympathy with the objects of the Society, and always anxious as we have been to advocate its claims, we have but too often been met with apathy on the part of the gardeners (we are speaking generally), and the Institution has been, and still is, dependent to a larger extent than is satisfactory to our self-respect, on the generous contributions of outsiders. The widening of the Society's rules may, and we hope will, do something to remove this state of things.

The most important change proposed and unanimously accepted was one which owes its inception, we believe, to Mr. HARRY VEITCH. It will go far to meet objections that are frequently raised. Here is the proposal, Rule III., Clause 10:—

The committee shall be empowered, previous to any election, to credit any candidate who has paid—

4 years' subscriptions with	50 votes.
5	100 ..
6	150 ..
7	200 ..
8	250 ..
9	300 ..
10	350 ..
11	400 ..
12	450 ..
13	500 ..
14	550 ..

This new rule, it will be seen, ensures that a man applying for the pension shall have of right, at least fifty votes, if he has subscribed not less than four years, and fifty additional votes each year up to fourteen years. These votes are, of course, quite independent of any that may be cast for the applicant by the members in the ordinary course. The subscriber will now feel that he is sure of some votes if only he has subscribed for four years. Of course the old rule remains in force, by virtue of which those who have subscribed fifteen years receive the benefits of the society as it were of right, at any rate, without the trouble and expense of an election. Another rule (III., 14) will be received with satisfaction, as it empowers the committee in its discretion to grant gratuities, not exceeding £5 to any one candidate, to each unsuccessful candidate at any election, provided such candidate is a life member, or has subscribed to the institution for at least four years immediately prior to the election.

The other rules do not call for special note. The existing system of election is not altered in spite of its cumbrousness, and of the needless trouble and expense it entails upon the applicant and his friends, to say nothing of the quite

uncalled-for humiliation the candidates are subjected to in being made objects of charity, when in reality they, or many of them, are merely claiming what belongs to them of right—morally, if not legally.

We believe a less cumbrous method might be adopted if the committee, who must know so much more about the merits of each case than anyone else, would select from among the applicants the names of those whom they recommend for election. At the day of election the members present would exercise by ballot their right of objecting to any particular candidate, and of substituting some other whom they might prefer. In any case it is desirable to reduce the begging system to its lowest limits, remembering that our poor friends are not seeking charity in any invidious sense, but simply the assistance in their hour of need, which they have contributed to others so long as they were able to do so.

But at this season there is really no room for discussion on points of detail like this. We are all as one on the general principle. The only thing left for those who can do so is, to take out their cheque-books and fill up a good sum for the benefit of one or other, or both, of our gardening benevolent societies, and to remember the claims of the old and the infirm as well as of the infant and helpless orphan. That is a rule which will never require to be altered, one that always remains in force, and one the fulfilment of which should be for ever regarded as a sacred duty.

LINNEAN SOCIETY.—At this meeting held on Thursday, December 15, Professor STEWART, President, in the chair, Messrs. L. A. BERNAYS, G. GRAY, and W. WHITEWELL were elected, and Messrs. W. STANLEY KENT, H. W. MONCKTON, and F. G. PARSONS, were admitted Fellows of the Society. The President announced the recent death of Mr. H. T. STANTON, a Fellow and former Vice-President of the Society, and of an European reputation amongst entomologists, by whom his loss would be widely felt. Mr. D. MORRIS exhibited a series of botanical photographs from the West Coast of Africa, and gave some interesting details about the appearance and mode of growth of some of the more remarkable forest trees and plants of that region. The Secretary exhibited a large collection of photographs of Lichens, very neatly mounted and labelled, which had been recently presented to the Society by Professor ARNOLD of Munich. A paper was then read by Dr. MAXWELL T. MASTERS, F.R.S., on the "Classification and Geographical Distribution of the Taxaceæ and Coniferæ," his remarks being illustrated by a specially prepared map, showing proposed "tabulation areas," lent by Mr. C. B. CLARKE, and by specimens of the fruit and leaves of some of the more notable forms. The meeting then adjourned to January 19, 1893.

SIR RICHARD OWEN.—The death of the veteran anatomist calls to mind the immensity of his services to science, the modesty and kindness of his manner, and the profundity of his knowledge. The greatness of his work has to some extent been eclipsed among the general public by the fame of DARWIN; but this is but temporary, as it is certain that the value of OWEN'S contributions to knowledge can never be detracted from. Curiously it is not his practical work that has suffered or can suffer, but his addiction to dogmas and theories now known to be arbitrary, and as botanists say, "artificial" as compared with the "natural" course of evolution. OWEN'S literary style also was harsh and overloaded with neologisms and technicalities; but when all is said, OWEN remains one of the glories of our nineteenth century. In his garden at Sheen, the veteran professor showed a keen appreciation of natural beauty. To him his garden was a real source of recreation. It was not formal or technical, it was

FIG. 122.—RHODODENDRON MANGLESII: FLOWERS WHITE, SPOTTED (SEE P. 762)

not botanic—but it was beautiful and reposeful. The anatomist was shown in the fossils and “old bones,” which peeped up in expected places, and gave an air of quaintness and surprise without ever degenerating into cockney-vulgarity, such as such excrescences are apt to do in a garden (see fig. 127, p. 775). OWEN died full of years and of honours, for unlike what too frequently occurs in this country, the single-minded man of science was honoured and revered by all classes of the community, from royalty downwards. The Natural History Museum at Kensington is his fittest monument, and no doubt within its walls a suitable memorial will be raised, to testify to posterity that his contemporaries were not unmindful of the genius and work of RICHARD OWEN.

SCHOLARSHIPS IN HORTICULTURE.—At a meeting of the Court of the Worshipful Company of Gardeners, held on Monday, December 19, at the Cannon Street Hotel, the scheme of examination in horticulture lately set out by the Royal Horticultural Society, was brought under discussion, and it was decided that the company should offer a scholarship of £26 a year, tenable for two years, to be awarded after the examination to the most successful candidate under certain conditions. It was also announced that a second scholarship of the same value was offered by the President of the Royal Horticultural Society, Sir TREVOR LAWRENCE, Bart., and it was hoped that others might follow such good examples. The exact conditions of the scholarships have yet to be settled, but the main provisions will be that the holder shall be between the ages of 18 and 22 years, and that they shall study gardening for one year at least at the Royal Horticultural Society's Gardens, Chiswick, and for the second year either there or at some other place to be approved.

HORTICULTURAL CLUB.—The usual monthly dinner and *conversations* were held at the rooms of the Club Hotel, Windsor, Victoria Street, on Tuesday evening, Mr. HARRY VEITCH, Vice-Chairman of the Club in the chair, and there was a large attendance of members. Amongst those present were the Rev. W. Wilks, F. R. Burnside, F. H. Gall, Messrs. John Lee, H. J. Pearson, A. H. Pearson, J. S. Cousins, J. Burrell, G. Bunyard, J. Cheal, G. Paul, W. J. Jeffries, W. H. Williams, Harry Turner, &c. The discussion on growing Chrysanthemums for exhibition was opened by an able paper by the Mayor of Taunton, W. Herbert Fowler, Esq., who was unable to be present; and the paper was read by Mr. A. H. Pearson. It was listened to with much interest, and elicited a very profitable discussion. Two fine boxes of Chrysanthemum blooms from Mr. Blair, gardener to the Duke of Sutherland at Trentham, were, through the kind offices of Mr. Harry Turner, sent to illustrate the lecture. The next meeting of the Club will be held on January 17.

GLASGOW BOTANIC GARDEN.—It seems that the municipality is about to appoint a superintendent of the parks, who is also to have the direction of the botanic garden. This intention shows that the civic fathers have no appreciation of the requirements of the case. Parks, pleasure-grounds, and recreation-grounds come under one category; botanic gardens, the purpose of which is educational rather than recreative, come under another. There is no reason why a botanic garden proper should not be made attractive, but attractiveness should be subordinate to scientific requirements, and the director of a botanic garden should be a botanist, and not hampered with the administrative detail of public parks in various quarters of the city. In the time of Dr. afterwards Sir WILLIAM HOOKER, the Glasgow garden did excellent botanical work, and there is no reason, that we know of, why it should not do so in the future.

THE BLENHEIM ORCHIDS.—On Monday the 19th inst., and four following days, the famous collection of Orchids which had been got together during the last ten years, was disposed of unreservedly

by Messrs PROTHEROE & MORRIS. Close by the houses containing these plants a large marquee had been erected to serve as an auction-room. The plants were, in most cases, well cultivated, and although there were few exceptionally fine varieties, a good many specimens of fine types were included. Mr. W. H. PROTHEROE commenced the sale with nobloomed specimens of *Odontoglossum Alexandrae*, the last ten of the 400 lots disposed of including 1000 plants of this species. Among the specimens which realised high prices may be mentioned a plant of *Cattleya Lawrenceae*, with 150 pseudobulbs and 15 leads, 25 gs.; *C. Mendeli*, one 20 gs., another 15 gs.; *C. labiata autumnalis*, 12 gs.; *C. Skinneri*, with a supposed portion of *C. S. alba* mixed with it, 11 gs.; a fine plant of *Ada aurantiaca*, £8; *Cypripedium Morganiae*, £5; *Epidendrum prismatocarpum*, which had 35 spikes last year, 8 gs.; *Cymbidium Mastersianum*, 6 gs.; *Celoglyne pandurata*, a fine plant in a pan, 9 gs.; and *Sobralia xantholeuca*, 9½ gs. Other plants fetched only moderate prices. Few visitors arrived by the early trains, but the specials from London, Birmingham, and Worcester arriving at midday were well filled.

CHRISTMAS SUPPLIES IN COVENT GARDEN.

The unusually mild weather that has obtained during the last few weeks has been more favourable than otherwise to the growers of flowers, and consequently a show of even more than usual extent is to be seen. Abundance of Lilies, Hyacinths, Lilacs, Tulips, and Azaleas are generally grown for the Christmas season, but there are more Roses, *Euphorbia jacquinetiflora*, Narcissus, Freesias, Poinsettias, and such-like favourites—not quite so easy of management as the former—than is usual. A good supply of Orchids, including some sprays of *Calanthes*, may also be seen in the Central Avenue at Covent Garden. In another column will be seen notes of two places which have contributed to the floral display. It is worthy of notice that despite the unusually mild weather above referred to, the number of Chrysanthemums is much larger than we have seen at this late season on former occasions, which would appear to indicate that the growers have been fairly successful in their efforts to prolong the “mum” season into the new year. Evergreens are here in quantity, and the Holly appears to be fairly well-berried. In the fruit market there seems to be no limit to the supply of Apples and Oranges, and the Apples, which are principally from America and Tasmania, are selling at very low prices. Nuts, too, are abundant, and the sale for them is good. English Grapes are present in fair quantity, and obtain fair prices, a very large proportion of these are Gros Colmar, although some few Muscats, and other varieties can be had. Amongst the less common of the imported fruits, are some Pameloes, Limes, and a number of custard Apples, the fruit of a species of *Anona*. The weather which has been fairly free from fog for some time past, changed on Wednesday, when London was again enveloped in its murky shroud.

ASSESSMENT FOR RATES.—Information is continually applied for and given by the solicitor to members of the Nursery and Seed Trade Association 30, Wood Street, Cheapside, E.C. The benefit of Sections 211, Sub-section (1), (b) and 230 of the Public Health Act, 1875, which enacted that “The occupier of any land used as arable, meadow or pasture ground only, or as woodlands, market gardens, or nursery grounds, shall be assessed to the General District Rate in an urban district, or to a separate rate levied in respect of special expenses within the meaning of the said Act in a rural district, in the proportion of one-fourth part only of the net annual value or rateable value of such land, and under which the case of *Purser v. The Worthing Local Board* was decided, whereby it was held that a market gardener or nurseryman, who had erected greenhouses and glasshouses on land in an urban district, was only liable to be rated to the General District Rate in the proportion of one-fourth part

only of the net annual value of the property, has by the Allotments Rating Exemption Act, 1891, been extended to allotments not more than 2 acres in extent, and let as such, and cultivated as a garden or a farm, or partly as a garden and partly as a farm.

INSTRUCTION FOR FORESTERS AND GARDENERS IN THE ROYAL BOTANIC GARDEN, EDINBURGH.—The following are the subjects treated of in the various courses of lectures. CHEMISTRY is dealt with by LEONARD DOBBIN, Ph.D., assistant to the Professor of Chemistry in the University of Edinburgh, who gives the following synopsis. Different kinds of matter: three physical states of matter; physical changes; chemical changes; chemical changes constantly occurring in nature. Chemical elements: compounds; mixtures. Composition of plants: water; combustible matter; incombustible matter or ash. Chemistry of water: oxygen; hydrogen; ozone. Atoms and molecules: conditions, characteristics, and laws of chemical combination. Nitrogen: ammonia; nitric acids (acids; salts); nitrates; nitrites. Carbon: marsh gas; carbonic anhydride or carbonic acid gas; carbonates. Air: the gases of the atmosphere (nitrogen, oxygen, water vapour, ammonia). Sulphur: sulphuretted hydrogen; sulphides; sulphuric acid; sulphates. Phosphorus: phosphates. Chlorine: hydrochloric acid; chlorides. Silicon compounds: quartz; sand; silicates. Potassium and sodium compounds: the chlorides, carbonates, nitrates, and sulphates. Calcium compounds: limestones; shells; quicklime; slaked lime; calcium sulphate and silicate. Iron: cast iron; wrought iron; steel; oxides, carbonates, sulphides, and sulphates of iron. Magnesium compounds: sulphate, carbonate, silicates, &c. Aluminium compounds: clay; alum. Organic compounds: oxalic, tartaric, citric, and malic acids; starch; sugar; fats; oils; albumen, &c. Soils: formation and composition; chemical changes occurring within soils. Manures: composition of farmyard and of artificial manures; application and uses of manures. Food of plants: nature and sources. Decay and putrefaction.

MENSURATION, LAND SURVEYING and LEVELLING by A. D. RICHARDSON. Geometry: its application in mensuration and land surveying. Mensuration of lines: linear measures; properties of the right-angled triangle and circle. Mensuration of surfaces: square measures; area of the parallelogram, triangle, trapezoid, trapezium, polygon, and circle. Mensuration of solids: solid measures; volume of the prism, cylinder, pyramid, cone, sphere, wedge, and prismoid. Land surveying: two fundamental methods, viz. (a), by distances and offsets, and (b) by triangles; by chain and cross; by angular instruments. Surveying by chain and cross: chain and arrows; measuring tape; offset staff; cross staff; optical square; marks and signals; stations and station lines; chained triangles; perpendiculars; tie-lines; offsets; chaining on slopes; obstacles in station lines; surveying inaccessible areas, roads, rivers, &c.; finding meridians; plotting survey; scales; computing area of survey; “Simpson” rule. Surveying by angular instruments: “traversing” and “trigonometrical” surveys; the theodolite, box sextant, and prismatic compass—their adjustments and uses; selection of base lines and stations; measurement of base lines; measurement and protracting of angles; trigonometrical formulæ required. Levelling: principles of levelling; levelling instruments; “dummy” and other levels; levelling staff; levelling book; datum point; datum line; bench marks; cross sections; flying and check levels; reducing levels and plotting the section; scales. Setting out: ranging straight and curved lines; marking out centre line on ground; working section and level book; “boning” rods, &c. The practical part of the course, which will embrace field work and levelling, will be taken up in the summer evenings.

PHYSICS, by WILLIAM LEDDIE, D.Sc., assistant to the professor of natural philosophy in the University of Edinburgh. The course will be devoted to an elementary exposition of the pheno-

mena of the physical universe and the laws regulating them, special attention being given to those points which are likely to be of practical value to the class. In the introductory lecture a general sketch of the subject will be given, and its various sub-divisions will be indicated. In the succeeding lectures some of the most important of the sub-divisions will be discussed in detail. The properties of matter—gases, liquids, and solids—will be treated at considerable length in the earlier part of the course, and necessary parts of dynamics, which is not suited for detailed treatment to a non-mathematical audience, will be introduced from the point of view of energy. The subjects of heat and light will receive full elementary discussion, and certain electrical phenomena and principles will also be considered. In all cases the bearing of the questions under discussion on meteorological and other natural phenomena will be fully pointed out. At the end of each lecture the subject for the following one will be indicated, and the corresponding portions of text books, which the class may read in preparation, will be pointed out.

CARDIFF HORTICULTURAL SOCIETY.—The annual meeting of this society was held in the Town Hall on Wednesday, the 14th inst. The accounts for the past year were produced, and showed a small balance in hand, which was considered satisfactory in face of the large falling off in gate receipts, caused by the downpour of rain on the second day of the show. The officers for the following year are as follows:—President, the MAYOR; Chairman of Committee, Mr. J. D. MORGAN; Vice-Chairman, Mr. STEPHEN TRESSEDER; Secretary, Mr. H. GILLET. The next show is fixed for Tuesday and Wednesday, August 15 and 16.

THE MIDLAND COUNTIES CARNATION AND PICOTEE SOCIETY.—Amateur cultivators of the Carnation and Picotee will welcome the second annual report just published, as it contains a list of the varieties exhibited in all the winning stands at the last August exhibition in the Birmingham Botanical Gardens, as well as a brief list in each of the various classes of both flowers of the finest sorts amateurs are recommended to cultivate. The income of the Society for the year was £188, prizes paid £90, and a donation of £5 each to the Gardeners' Benevolent Institution, and the Gardeners' Orphan Fund, leaving a balance in hand of £32.

APRICOTS AND RAISINS FROM MILDURA.—Mildura, in the Colony of Victoria, which bade fair to remain a barren desert, has really many natural advantages, needing only the expenditure of capital and a due supply of water to become a flourishing and fertile land. Messrs. CHAFFEY, Bros., have both means and irrigation at their command, for we have received some very promising specimens of Apricots and Raisins grown and dried by them in Mildura. The Raisins are somewhat small in size but of good flavour, comparing favourably with those from other countries. The Apricots are not remarkable either in size or quality; possibly some other variety of the fruit would produce better results; the species which does well in one locality is frequently quite a failure when grown under other conditions. Still, as a promise for the future, the fruit sent is very satisfactory.

SEEDLINGS.—We learn that the great majority of the seedlings, described in Sir JOHN LUNBOCK'S book on *Seedlings*, see *ante*, p. 618, have been grown for the purpose at Kew since 1884. With the exception of a few British plants, and "one or two seeds" from the Cambridge Botanic Garden, the British Museum, and Mr. HANBURY, all the drawings and descriptions were prepared from Kew material. Mr. FRASER says "99 per cent." of the work was done at Kew. The seedlings which Mr. FRASER did not draw himself he obtained from Kew to send to Mr. HENRY.

LIVERPOOL HORTICULTURAL ASSOCIATION.—On Saturday evening, December 17, the Liverpool Horticultural Association held their second meeting of the season in the Free Library, Mr. THOS. WHITE

in the chair, when Mr. HARRISON, of Knowsley, read a paper on "Ornamental Trees and Shrubs," which was chiefly addressed to young gardeners. The paper was very well received, and the reading was followed by some interesting and apposite remarks by Mr. RANGER, Mr. R. W. KER, the chairman, and others. Votes of Thanks to the reader and the chairman brought a pleasant evening to a close.

HORTICULTURAL INSTRUCTION.—Mr. THOMAS BUNYARD, having delivered a preliminary lecture, has been appointed lecturer on horticulture, fruit-farming, and kindred subjects, to the Norfolk County Council.

BIRMINGHAM GARDENERS' ASSOCIATION.—A paper on "The Rose," contributed by Mr. HENRY CANNELL, Swanley, Kent, with cultural instructions as to planting and pruning garden Roses, was read, in which early planting in October or November

FIG. 123.—RHODODENDRON BALSAMINIFLORUM.
(SEL. P. 764.)

The flower at the top is white, the lower one red-coloured.

was strongly recommended, as root-action sets in at once; and as an example of this, a young dwarf plant lifted in October and "laid in" was sent with a quantity of young newly-made roots. Mr. CANNELL remarked on the advantage of planting at this season, the Rose making few if any new roots after November until the spring. A liberal cutting away of long growths, both on newly-planted and established plants, was also recommended to be performed in the month of November. Much sound information was given, and a lengthened discussion followed. Some plants of the Swanley strain of fine Cyclamen were also sent, and a very fine bloom of the pure white late-blooming Japanese Chrysanthemum, Middle Marie Recoura, and also trusses of the new double New Life Zonal Pelargonium. Messrs. THOMSON & Co., nurserymen, contributed a fine bloom of a double scarlet hybrid Margaret Carnation, from a plant raised from seed sown in February last, which had been in bloom since August. Messrs. VERTIGANS & Co., nurserymen, sent ripe fruit of Diospyros kaki, which was tasted, and the flavour found to be pleasant, and not astringent.

PINE-NUTS.—Messrs. FULLER, the well-known American confectioners, of Regent Street and the Strand, are providing, amongst other Christmas dainties, bonbons made of the seeds of some species of Pinus. These are embedded in sugar, and have a very agreeable flavour. Pine-nuts are novelties in this country, but the kernels of Pinus Fremontiana form an article of commerce among, and are the chief food of, the Indians of the Sierra Nevada. Other Conifers possessing edible seeds are Pinus Gerardiana of Cashmere and the Himalayas, of which the kernels are sweet, and nearly an inch long; P. Llaveana, of Mexico; P. longifolia, of which the seeds are much prized by dwellers in the hilly regions of India; P. Sabiniana, of Upper California; the Sugar Pine (P. Lambertiana), and P. Cembra, of which the kernels are used for food by the Swiss peasants: Pinus pinea, whose kernels are consumed by the Italian peasantry. It would seem that there is plenty of variety yet to be made in our confectionery, and there must be dozens more of similar nuts that would lend themselves to the same purpose, with equally good result.

HARDY TERRESTRIAL ORCHIDS.—M. CORREYON, encouraged by the success of his previous treatises on hardy Ferns, and on alpine plants, now proposes to publish a similar work on hardy Orchids, especially those of Switzerland, Siberia, Japan, North America, the shores of the Mediterranean, &c. The price to subscribers is 3.50 francs. Intending subscribers should communicate with M. CORREYON at the Jardin Alpin d'Acclimatation, Genève.

MR. WILLIAM YOUNG.—At a meeting of horticultural and other friends held in the Society's Office, Waverley Market, Edinburgh, on November 28, 1892, it was proposed, and unanimously agreed to, that the time had now arrived when some substantial recognition should be made of Mr. WILLIAM YOUNG'S long and arduous services as Assistant-Secretary, Royal Caledonian Horticultural Society, Edinburgh. For upwards of forty years (for thirty of which he has given his services gratuitously) Mr. Young has had a large share in the active management of the principal floral exhibitions held in Edinburgh, and in this way has been the means of giving a great amount of pleasure to the citizens in general, and all interested in horticulture. The following gentlemen have formed themselves into a provisional committee: Mr. DAVIN MITCHELL, 6, Comely Bank, Edinburgh, as Hon. Treasurer; John Methven (T. Methven & Sons), Edinburgh, £2 2s.; D. W. Thomson, 24, Frederick Street, Edinburgh, £2 2s.; D. P. Laird (R. B. Laird & Sons), Edinburgh, £2 2s.; Alex. Milne (Dickson & Sons), Edinburgh, £2 2s.; William Welsh (Dicksons & Co.), £2 2s.; Angus McLeod, 6, Sylvan Place, Edinburgh, £1 1s.

EAST ANGLIAN HORTICULTURAL CLUB.—At the third annual general meeting of this Club, held at the "City Arms," Norwich, on Wednesday, December 14, the President, Mr. F. MORRIS, was presented with an enlarged framed photograph of himself, and was also, for the fourth time, elected President; and Mr. BARTLETT, of Earlham Hall Gardens, was chosen as Vice-Chairman, and Messrs. BRACEY and BARNES as his deputies. Mr. C. DANIELS was appointed Hon. Treasurer, in lieu of Mr. GEO. DANIELS, who had retired, to the great regret of all the members, and it was resolved that a letter expressing the same should be addressed to that gentleman. Mr. A. F. UPSTONE was for the third time asked to accept the post of Hon. Secretary; a few new members for the committee were selected, arrangements were made for the reading of papers, and a highly satisfactory meeting was brought to a close.

TREE PLANTING IN IRELAND.—Planting operations in the West of Ireland being contemplated on a large scale this season by the Irish Land Commissioners, we have to chronicle the fact that Messrs. WM. FELL & Co., Hexham, are requested to supply 350,000 transplanted Scotch Fir, raised from Highland seed.

"THE VEGETARIAN" appears in the form of a double Christmas number. Doubtless, some people will eat more than is good for them at this season, and a course of vegetarianism might be of service subsequently. Whether the permanent adoption of a purely vegetable diet would benefit all and sundry is another matter. We can conceive of two classes of cases where it would be very beneficial, the one where an excess of meat-foods had been indulged in, the other where food of any kind has been deficient. Between the two extremes is comprised a vast multitude, some of whom might act on the counsel proffered in the paper before us, though we must admit, not very seductively, "Prove all things."

HARPENDEN HORTICULTURAL SOCIETY.—The fourteenth annual general meeting of members of this Society was held in the British School on the 20th inst., Mr. R. LYDEKKE, J.P., one of the Vice-Presidents, in the chair. The report of the committee and the balance-sheet showed that the total amount realised from all sources was £143 16s. 6d., while the expenditure amounted to £155 5s. 11d., leaving a debt of £11 8s. 7d. due to the Treasurer. This was stated to be owing to adverse weather on the show day. It was resolved that the date of the next show be Wednesday, August 23, and that efforts be made to obtain £20 for special prizes for nine stove and greenhouse plants in the open division.

PUBLICATIONS RECEIVED.—*Poems in Petro-olum.* By JOHN C. GRANT. (F. W. ALLEN, 4, Paternoster Row, London, E.C.)

TREES AND SHRUBS.

ABIES BRACTEATA.

This distinct Conifer suffered a little from the severe winter of 1891, many of the tips of leaves, particularly those to the north-east, having a brown rusty appearance. The tree, however, has this summer made excellent growth, and all traces of the severity of last winter are hidden or past away. This is a very distinct species, and is fast growing, making a handsome pyramidal tree. The one growing here is at present 50 feet in height, with a girth at 5 feet up of 4 feet 9 inches. As yet, however, it has not produced any of its remarkable cones. It would be interesting to know if any has been produced in England. I have not heard of any. [Oh, yes! At Eastnor Castle. See figure in *Gardeners' Chronicle*, Feb. 23, 1889. Ed.] *A. Harding, Orton, Longueville.*

ABIES AMABILIS.

This is another handsome and distinct species, in colour not unlike *A. Nordmanniana*, but has foliage more dense and silvery beneath. It does not form so straight a trunk as many others, as some years the right leader seems abortive, but when it does start it grows rapidly. This year the leader made 2 feet of growth. Its height is 42 feet, and circumference at 5 feet up the same as the above species, 4 feet 9 inches. This tree has produced one cone, that was in 1888, but I failed to save it; it dropped to pieces. It was about twice the size of cones of *A. Nordmanniana*. No frost seems to injure it. The male catkins are of pink colour, and look pretty in spring. *A. Harding, Orton Longueville.*

GARDEN EGGS.

The Garden Egg, or Egg plant (*Solanum Melongena*), is supposed to be native of Asia. It can be readily grown in Jamaica, and at certain times of the year, it would be profitable to send it to the United States markets.

Soil and Situation.—A good rich soil is necessary; plenty of thoroughly rotted short stable or cattle manure should be dug in. A sheltered position should be chosen, where abundance of water can be given.

Sowing Seed.—The seed is sown in nursery beds, and when the seedlings are 2 to 3 inches high, they

may be transplanted into the permanent beds. About one ounce of seed should give 100 plants.

Planting.—The plants are set out at 3 feet apart in a row, the rows being 5 feet apart. About 3000 plants go to the acre.

Cultivation.—If well grown, large fruits are desired, only a certain number should be allowed to each plant in proportion to its strength and the particular variety. The ends of the branches should be pinched when the fruits are ripening. The varieties differ in the length of time they take to ripen their fruit, from two to six months. In a tropical climate like Jamaica, it is preferable to grow those varieties which require the longest time, as the fruit is larger and better flavoured. In temperate climates, on the other hand, the "early" varieties are preferred.

Varieties.—The following are the chief varieties:—

1. Long Purple.—The fruit is from 6 to 8 inches long, and 2 to 3 inches in diameter; it is best in quality before it is fully grown. Five or six months are necessary for its growth. There may be eight or ten fruits on a large healthy plant.

2. Early Long Purple.—This is only an early variety of the preceding, and the plant is not so strong nor so large.

3. Round Purple.—The fruits are large and somewhat Pear-shaped. Not more than three or four should be left to grow on a plant.

4. New York Improved.—The fruit is like that of the Round Purple, but the plant is smaller. Not more than two fruits should be allowed to a single plant.

5. Early Dwarf Purple.—This is an early variety. The plant is low-growing and branching, and may carry ten or twelve fruits. The fruit is of a longer shape than the Round Purple, 3 or 4 inches long, and about 2 inches in diameter at the thick end.

6. White China.—This is a very distinct variety, with long slender white fruit.

7. Landreth's Thornless Large Round Purple.—This is a variety recommended by Messrs. Landreth.

8. Large Round White.—Similar to No. 7, but white in colour.

Nos. 1 to 6 can be obtained from Messrs. Vilmorin, Andrieux & Co., 4, Quai de la Mégisserie, Paris. Nos. 2, 4, 7, and 8, from Messrs. Landreth, 21, South Sixth Street, Philadelphia, U.S.A.

The following note is by Mr. William Harris:—

"When in charge of Castleton Gardens some years ago, I tried several times to raise Garden Eggs from seed, but without success, the plants either dwindling away and dying after a sickly existence, or, if they lived, failing to produce fruit.

"I found that the settlers in the Castleton district grafted their plants on the Susumber (*Solanum mammosum*), a common Jamaica plant, which practice I adopted with great success. The grafted plants produce fruits of a very large size and fine flavour.

"The mode of grafting which I adopted was that known as wedge grafting. The stock is cut to the depth of 1½ inches with a sharp knife, and the cleft kept open till the scion is inserted.

"The scion (a piece of growing branch of Garden Egg, about twice as thick as an ordinary lead pencil, and about 4 inches long) is cut wedge-shaped, and inserted in the cleft, so that the inner barks may coincide. It is then wrapped with soft string, or woollen yarn, and covered with a handful of clay.

"There should be no bark left upon the inserted part of the scion except that on the outside."

The following notes are taken from the Seed Catalogue of Messrs. Landreth:—

"On Prices.—Commission merchants in Philadelphia pay the market gardener about an average 1½ cents per fruit. The highest prices are 8 and 10 cents per fruit.

"Florida fruit arrives in Philadelphia the latter part of November, and commands 6 to 8 dols. per barrel crate. Earlier in the autumn the market is supplied by fruit from Jersey. Towards Christmas the price of Florida Egg plants rises to 10 dols. per barrel crate, and then declines by April to 6 to 8 dols., and by May to 5 dols., after which they are

likely to arrive in a damaged condition and be worthless.

"On Cooking.—Fried. Peel the fruit and cut crosswise in slices of full diameter and of one-third of an inch in thickness, sprinkle salt between the slices and set aside for half an hour, when remove the water, dry and dip in butter and bread crumbs, and fry in hot lard until brown.

"Baked. Peel the fruit and cut into small pieces. Place in a pan with butter and sweet oil over a fire for 3 minutes, add salt, pepper, and a little sauce or gravy. Take it from the pan, and put in a baking dish, coat over with bread-crumbs and Swiss cheese, and bake in oven till quite brown." *Bulletin of the Botanical Department, Jamaica.*

HOME CORRESPONDENCE.

THE KEW GUILD.—The sympathetic notice of the proposed Kew Guild in the last number of the *Gardeners' Chronicle* is introduced by a remark which seems to need a word of explanation. The proposal has received my approval, as likely to meet what we have long felt to be desirable, that of knowing the whereabouts and careers of our men after they have left Kew. Its main object is, therefore, to foster and maintain the *esprit de corps*, which has grown up in the establishment. To imply, however, that it is in any way an "organisation for gardeners, in order that they may obtain the social position and emoluments to which their qualifications entitle them," is to put the proposed guild on the level of a trades union, which is a form of combination absolutely foreign to the end now in view. *W. T. Thiselton-Dyer.*

EDINBURGH BOTANIC GARDEN.—In spring and summer "the stonework" is three parts hidden. "The little pockets," each with its labelled occupant, I admit, are unsightly now, but they are not nearly so much so in the summer. It was so arranged when the rockery was first formed, to keep the plants separate. I used the words, "almost perfect," because it fulfils the two necessities of a botanic rock-garden—use and ornament. "Voyager" probably did not read my notice a second time, or else he would not have written, "the plants enumerated are by no means remarkable for interest or variety." In the preliminary part, I distinctly say that I was only giving a list of those plants that were in flower on a bitter cold day in winter. It was far too cold to read all the labels to find rare plants, many of them dormant. If by the North of Scotland "Voyager" means the counties on the Moray Firth, e.g., Elgin and Nairn, they have a warmer climate in winter than Edinburgh. If he will say what gardens they were he saw, it would be of interest to many more besides myself. Edinburgh has no intention of trying to rival Kew, neither should there be any rivalry. "Voyager" must know that opinions differ as to what is tasteless or otherwise, and that two adjectives do not make a "eulogistic notice." *Vagabond.*

HAREWOOD HOUSE, YORKSHIRE.—It will interest many of your readers who know this fine old Yorkshire seat to hear that Mr. Fowler, who has for so many years presided over the gardens there, has now retired, and has been succeeded by Mr. James Jeffrey, from Caversham Park, near Reading. The kitchen garden, fruit, and plant-houses are all being thoroughly overhauled, and the heating of the latter improved and modernised. Harewood is in many ways a unique place, and the mansion, its situation, and terrace gardens are among the finest of their kind in England. Among other interesting objects, they claim to possess the oldest white Vine in England—said to have been planted in 1783. The house, which it occupies fully, is a lean-to 60 by 20 feet, built in 1839. It is planted outside, and the stem measures some 17½ inches in circumference a little above where it enters the house. It still looks hale and hearty, and fruits freely, though the bunches are now very small. *M.*

THE GARDENERS' ROYAL BENEVOLENT INSTITUTION.—I have carefully read the letters of your correspondents J. H. Goodacre, W. Smith, and John Chinnery, recently appearing in *Gardeners' Chronicle* on the subject of the Gardeners' Benevolent Institution. I feel like many of my brother gardeners, that if these correspondents would kindly give us a little information as regards the rules of the

institution and the benefits a gardener would derive from it, many young gardeners would be greatly enlightened. [See p. 766. Ed.] *Thos. Price, Castle Pygyn Gardens, Abergwili.*

EUROPEAN RHODODENDRONS.—I am much obliged to Mr. O. Forster for his note on my Rhododendron paper (see *Gardeners' Chronicle*, p. 731). In the table showing the distribution of the genus, I said there were three species in Europe, viz., *R. ferrugineum*, *R. birsutum*, and *R. lapponicum*. *R. ponticum* and *R. flavum* (*Azalea pontica*), I included with the Asiatic species, although they do really extend into Europe. Surely Mr. Forster is wrong in calling *R. Ungerni* and *R. caucasicum* European? *Rhododendron myrtifolium* is a hybrid, not a species; and *R. chamæcistus* is now removed into a different genus, viz., *Rhodothamnus*. I should have said that *R. ferrugineum* and *R. birsutum* are the only species common in Europe, instead of the only two wild; this slip is, however, corrected in the context. *W. H.*

CHRYSANTHEMUM MR. S. COLEMAN.—Mr. Divers is evidently not aware that Miss M. A. Haggas is a sport from Mrs. Heale, and therefore cannot be in a direct line between the one above-named, and its parent, Princess of Wales; therefore, it is only a simple reversion to the type. Is Mr. Divers certain the plant was one of Mrs. S. Coleman to begin with; or is it simply a mistake in naming? *E. M.*

CAMPBELL'S FUMIGATING ROLLS.—In reading the *Gardeners' Chronicle* of the 10th inst., I was somewhat surprised on reading the article by your excellent correspondent, J. Douglas, "The Cineraria and Calceolaria in Winter," p. 713, to find the following sentence—relating to the heading of this paragraph—"the operator not needing to go into the house at all—in fact, it is rather dangerous to do so." I have used Campbell's Rolls rather extensively for the last two years, and have never yet found the slightest danger in them, either to myself or my men (who, I may say, prefer this fumigating material to all others that I have tried), and I should not have the least hesitation in fumigating half-a-dozen houses one after the other, and remaining in the whole time. I consider this one of the best articles in the market for the destruction of fly and thrips, and one that can be safely trusted in the hands of the most inexperienced operator. *B. Ashton, Glossop Hall Gardens, Derbyshire.*

CHRYSANTHEMUM JOHN LAMBERT AT THE HULL SHOW.—In your report of the Hull Chrysanthemum Show it is stated that Golden Queen of England was awarded the prize for the premier incurved bloom in the show. In justice to the committee of the National Chrysanthemum Society (who, to prove its distinct improvement on Golden Queen of England, gave the sport John Lambert a double test, in the shape of a second year's trial, before awarding a First-class Certificate, a decision more than justified by the position the sport has held as one of the best incurves in almost every show reported in the *Gardeners' Chronicle*), I would wish you to state what were the real facts of the case. At Hull, Golden Queen of England, mentioned as the premier bloom in the show, was staged and labelled by the exhibitor as John Lambert. Someone trusting to his own judgment crossed out the original name, and substituted that of Golden Queen of England, which, even were the name John Lambert distasteful to him, is a proceeding I feel sure would meet with the condemnation of exhibitors generally, and is altogether without precedent. Perhaps someone who was present on that occasion will kindly give a correct version of the matter. *John Lambert, Powis Castle Gardens, N. Wales.*

THE KAKI.—Why does Mr. Hanbury call the Kaki rare? It is very common in Japan, common (under its American name of Persimmon) in large parts of the United States, and very common in the Department of Var as a cottage garden tree. *A.*

ITINERANT PLANT DEALERS.—Perhaps dealers of this class may not be so plentiful as those who similarly follow other industries; nevertheless, whenever they are to the fore, I think it will readily be admitted that, in verbosity and wonderful lore, they are in nowise behind their brethren who follow other itinerant pursuits. A good example of what is meant was to be seen at the recent cattle show at Islington, where an enterprising vendor was selling what he styled "Nature's greatest curiosity," which he said was "the Chinese Lily Bulb,

or Water-plant," giving the district where it was discovered—"North-western part of China in the Lake of Alsok;" and in language similar to the individual who sold the Pop-corn at Buffalo Bill's show, said, "It was the only plant in the known world that will grow a long vine, and produce beautiful flowers out of a common jar or a glass of water." The height was given as from 18 to 22 inches, carrying eight or nine of the finest flowers that have ever been seen (*sic*) in this country. Moreover, every flower dropped a new seed, and they bloomed twice a year; further, that it was first shown in San Francisco in 1890, and got the 1st prize of 400 dols. Cultural directions were added, they were definite and to the point, viz., "Place in a jar of water and change it daily for fifteen days, then once a week." We were also told that it floated for ten days, and at fifteen began to grow. During the five intermediate days, we were not told whether it floated or sank; but, still marvellous, the thing was to be had in four assorted colours, red, yellow, pink and white, also male and female; the last seemed to be superfluous as we were before told, "that each flower dropped a new seed." Moreover, it could only be had from the vendor, who was "the only importer." That so much could be made out of a floating herb, which has been tolerably well-known for about 100

FIG. 124.—RHODODENDRON PRÆLON. [SEE P. 762.]

years, seemed to us, the most marvellous part of the business. The thing was the common Trapa, or water Chestnut, by no means an uncommon plant with those who go in for aquaria plants; indeed, the species is very suitable for small aquaria, and may be readily procured through any ordinary seedsman; but, I question if anyone ever saw any but the last-named colour, which may be said to be whitish. The varieties under consideration were *bispinosa* and *nataus*, but *Trapa verbanensis* from "Lago Maggiore," in Italy, is hardier, and plants may frequently be procured. *F. R.*

THE MULBERRY.—A Mulberry tree grows in a somewhat sheltered part of the pleasure-grounds at this place, South Hants. Four years ago it was a fine tree, although much more than one hundred years old, and every year it bore a full crop of small fruit. The trunk was 4 feet high, and it had a girth of 6 feet 6 inches at 1 foot above the turf. At the height named the tree divided into three parts, two of one size, and the other much larger. The middle of one still August day, without any warning, the largest branch parted company, falling with a great crash, splitting the bole nearly to the ground, but retaining a hold on it at the bottom, with a few inches of living tissue. The remaining branches of the fallen tree were secured with iron bands and stays. A quantity of soil was laid over the fractured part, and supported and held

together by some large stones, amongst which English Ivy was planted with a view of hiding the stones and soil. The whole mass at the present time is permeated with roots from the Mulberry tree, and the fallen branch has made vigorous growths, the shoots of this year being 2 feet 6 inches long, with much larger leaves than hitherto, and we hope that these will fill up the space between the fallen branch and those still standing. The branch now on the ground has a spread of 40 feet, and still bears a full crop of fruit. Two years since we planted Crocus bulbs of various colours, which in the spring make a bright show among the bare braches. *E. M.* [Stout stakes of the Mulberry driven into the soil make the best means of increase. Ed.]

THE LATE MR. JOHN DOWNIE.—To the interesting details you have given of the life and work of my old friend, John Downie, allow me to add that, being only twenty years of age when his father died, he somewhat reluctantly accepted the offer his father's employer made to him to take the position of head gardener at South Bank, Edinburgh, as he doubted his ability as a youth to do justice to such a post. But the fact that his mother had been left with six children in addition to himself, and that stern necessity had made him the bread-winner for the family, he entered upon the new post with characteristic energy, and brought up his brothers and sisters until they were able to shift for themselves. He at once entered upon the culture of Dahlias, Pansies, and Phloxes, throwing considerable ardour into the work. He competed at various exhibitions, and won many prizes. About 1837 the Hollyhock engaged his attention, and it is worthy of record that it was then considered that the Hollyhock could be successfully grown in Scotland only if planted against a wall. In 1839 he obtained some well-ripened seed from plants of his own, and from them raised over one thousand seedlings, some of which showed a remarkable advance upon anything that had preceded them, and so highly were they prized that Mr. Downie named a collection which were distributed by Messrs. Dicksons & Co., florists, Edinburgh; and the next season another, which was sent out by Messrs. James Dickson & Sons, nurserymen, Edinburgh. Thus, Mr. Downie is entitled to the credit of having been the raiser of the first batch of named Hollyhocks obtained in Scotland. Fine and improved varieties of Pansies and Phloxes also rewarded Mr. Downie's efforts. During the same period he was a cultivator of Ranunculus and Gold-laced Polyanthus, taking leading prizes whenever he exhibited. The Dahlia was always a special favourite; he commenced its culture in 1833, and continued it at South Bank until he went into business in 1848. His knowledge of the Dahlia was large. He was for several years one of the judges at the Exhibition of the National Dahlia Society at the Crystal Palace, until increasing years made the long journey southwards undesirable. I do not think Mr. Downie can be said to have been the originator of the race of Fancy Pansies; I think the credit of that is rather due to the late Mr. John Salter, who, when driven from Versailles by the Revolution of 1848, came to Hammersmith, and set up in business near to the Railway Station, and raised from seed he brought with him from France some striped and blotched Pansies, several of which were named and distributed. From the best information I can obtain, I think Mr. John Laing, then at Dysart House, was one of the first in Scotland to take up this class of Pansy; but the greatest impetus to its popularity and improvement was given when, in 1856-57, M. Mieliez, of Lille, France, sent over to this country a batch of named varieties of his own raising that were an advance of almost anything previously seen. Messrs. Downie & Laird grew these Pansies with great success; raised and named several varieties, and created a sensation in London by exhibiting stands of blooms of great beauty on several occasions. To them is largely due its present popularity in Scotland, and in England also. I send you these details of the earlier years of the life of an estimable man, and a successful florist may be placed on record. The Pentstemon and Antirrhinum were also largely imported by the firm of Downie & Laird, who year after year sent out collections of named varieties. It seems difficult to imagine there is a further improvement possible in the Pentstemon and Antirrhinum than that which characterises it at the present day. *R. Dean, Ealing, W.*

CHRYSANTHEMUMS AT HILLWOOD.—Mr. Carruthers, the gardener at Hillwood, on the Corstophine Hill, is one of the leading Chrysanthemum

growers in Scotland. At the great show of this flower on November 16, 17 and 18, he was a very close 2nd to Mr. Parker, of Impney, for the £25 cup given for the forty-eight class by the Corporation of Edinburgh, the blue ribbon of the Waverley Market Shows. It is really wonderful how Mr. Carruthers is able to achieve the great results he does. He has only under his charge 180 plants to cut from, growing in an early vinery. At the time of my visit the third day after the show, he could have cut, if not as good a forty-eight, an equally good twenty-four. At the show he exhibited forty-eight, twenty-four, and six *V. Morels*. The show-blooms, which were still in their stands, were quite fresh, thus proving their great substance. With such a small number of plants, Mr. Carruthers is only able to grow the best varieties, but every novelty of merit is added. The varieties that were conspicuous for blooms of size and substance were Pelican, Puritan, Belle Paul, George Herring, Sarah Owen, Elaine, G. Atkinson, Rose Queen, Edward Audiguier, J. S. Dibden, Mons. Bernard, and, of course, *V. Morel*, W. II. Lincoln, Avalanche, Sunflower, and Stanstead White. A plant of Vivian Morel, from a cutting struck in June, supported a very large flower. W. Tricker is the same as Bride of Roses, which Mr. Carruthers obtained from Peter Henderson of New York. There were also splendid flowers of the chestnut red W. W. Coles and Miss Alice Broom. The latter may oust Molyneux from his proud position. Three full-sized *Gloriosums* on one plant showed the value of 9-inch pots. One of the seedlings raised from seed sent from Japan is very promising. It is a tubular-petalled variety, of a bright lemon colour. *Vagabond*.

PREMIER BLOOMS.—Visitors to our flower shows will doubtless have noticed the prizes awarded for these, but their adjudication under the present conditions must be a somewhat serious business to the judges. Say, to pick out the premier bloom in a "National" Rose Show. What a task it is to go through the boxes in all the competitive classes. Is it fair to expect these gentlemen to carry in their mind's eye the points of innumerable flowers which necessarily come under their bewildering notice? May not mistakes occur in consequence? Would not matters be simplified and expedited by its being an instruction to each exhibitor to stage what he considered to be his premier bloom separately? As by this method the competition would be at once focussed by the censors, comparative ease would be given in the award of the prizes, and the public would have the advantage of criticising, a pleasant process they do not now enjoy. As the schedules for next season's campaign will soon come under notice, now seems an appropriate time to bring the matter forward. *J. B.*

ISLES OF SCILLY: FORCING NARCISSUS.—On Monday, the 12th, I had the pleasure of inspecting the forcing-houses of Mr. Joshua Woodcock, of Porthloo, St. Mary's. By the way, I may say, in passing, that during the last three or four years these houses have been increased in number every year. Those who at the first condemned them, are beginning to say "We shall have to follow our neighbours if we want a share in early flowers." Mr. Woodcock has two houses, each 150 feet long; one has a lean-to roof, is 11 feet wide; the other is a span-roof, 15 feet. On my visit, I was not prepared for the sight that met my vision, in the lean-to house, which contained about 800 boxes, from which 300 bunches had been picked that morning, and it gave promise of another 300 in a day or two. In the other house that had not been gathered from, the sight was grand—a mass of golden-yellow from end to end; this house was incomplete in the middle of November. After the boxes had been put in the houses, fires were put on, but the crop made such a start that the fires were let out again, fearing they would be too early for the market. On December 1, fires were again lit, and the temperature kept up to about 60° by day and 50° by night. As soon as this crop is cleared away, which will be in about three weeks, Tomatos will be ready for going in. The bulbs are planted in boxes, are 20 inches long, 12 wide, and 6 deep, and contain about eighty bulbs. It may be interesting to know that these bulbs are the first to flower in the open ground the next season. The *Narcissus* crops throughout the islands are looking exceedingly healthy and prolific in bloom; nearly all the varieties are above-ground. Soleil d'Or is in bloom outdoors in many sheltered spots. They are more forward than on many previous years. *J. C. Tomkin, Isles of Scilly.*

A TRAVELLER'S NOTES.

(Continued from p. 791.)

Singapore Botanic Garden.—At the end of the palmetum is the nursery—with many young Palms in pots, seed-beds of others, including one of the *Kentia* McArthurii, as thick as Cress; here also are large quantities of *Crotons*, *Coleus*, *Alternantheras*, &c., for re-filling the numerous beds scattered all over the garden. In this nursery, alongside a narrow ditch, the *Arundinas* luxuriate and flower freely. There are two species here—*densa*, a fine large one, not unlike in colour and size *Lælia autumnalis*, and *Phillippii*, maroon and white, and much smaller in size, but still pretty and effective. Crossing over from the nursery to that part of the garden still under jungle, one comes in view of a magnificent bank of *Gleichenia dichotoma* and *flagellaris*, growing, as is demonstrated by the forest of young uncurled leaves, with extraordinary vigour. In one part, this splendid bank, in my opinion one of the finest things in the garden, stretches in an unbroken line along the road, and but a few feet above it for nearly 100 yards, reaches over undulating ground for several yards back to the jungle line. Passing back towards the band-stand, lined on one side by the jungle, in which are fine bushes of flowering *Sanchezia*, *Coleus*, *Honey-suckle*, *Dracænas*, large pieces of *Panax*, and fine blue *Solanum*, as well as *Acalyphas*, *Tagetes*, and smaller front-row plants, one reaches a large open space from which several roads diverge. Opposite this are two tall trees, with some fine *Platyserium biforme* hanging from their branches. They are fine, their long seaweed-like bunches of leaves, from 4 to 5 feet long, waving backward and forward in the wind. Here are also some *Caryota Cumingii* from the Philippine Islands, one bearing twelve spikes of flower and seeds, others bearing ripe, others unripe seed, one in bud, and three emerging from the stem, all of different size. It is a graceful sight, the long thick hanging strings of seeds or flower buds.

On this side of the band-stand are also some plants worth noting. Near a thick bushy *Rhaphis flabelliformis*, 12 feet through, and quite as high (a fine specimen), is a *Fagraea zeylanica* in flower, its large drooping flowers almost as large, and with the same recurved petals as *Lilium Harrisii*, are highly and sweetly scented. Its large obovate foliage is wonderfully glossy and handsome.

Another fine tree is *Melanochyla auriculata*, with stiff sessile leaves, 18 to 21 inches long, like a huge *Castanea vesca*. Returning towards the fernery, a wonderfully cool and pretty nook, its principal feature being the great *Angiopteris*, the Orchid-house is reached. On stages are many in pots, the *Calanthes*, especially *C. veratrifolia*, now freely flowering, being amongst the best. East Indian Orchids are weak, but *Cælogynes* are good. *Cypripediums* are well represented, *barbatum*, *Stonei*, and *Rothschildianum*, being amongst the best. There are also many *Dendrobiums*, *Bulbophyllums*, and other genera, but it is clear Mr. Ridley's inclination leads him to the kinds that are doubtless to him more interesting from a botanist's stand point. The plant-house, but a few yards from the Orchid-house, is an immense oblong enclosure, shaded in some parts by wooden bars, and in others not shaded at all. In the centre is a round stage, from which radiate six broad cemented paths 6 feet wide. Another path of equal width encircles the whole house. In the centre stage is a miscellaneous collection of plants—*Crotons*, *Hibiscus*, *Aroids*, *Dracænas*, *Ananas*, *Panax*, and small *Caryotas*; whilst, in a small glass bowl, *Ouvirandra fenestralis*, a fine piece, is producing two of its dichotomously-branched flower spikes. The two portions of the house not shaded from the sun by roofing are those at each end devoted to the *Crotons*, some of which are fine highly-coloured specimens. The *Aroids* are also very good. All kinds of *Alocasias*, *Anthuriums*, and some fine pieces of *Marantas* in low tubs; foliage *Begonias*, grown in the same way, are represented by a large, varied, and complete collection, as are the *Caladiums*, in pots, *Dracænas*, and *Bromeliads*. At one end on a 4-foot stage are flowering plants in pots. *Tagetes*, *Datura*, *Impatiens*, *Eucharis*, *Torenia asiatica*, *Dahlia*, growing like weeds; *Phlox subulata*, *Begonias*, and *Gaillardias*, are amongst the varied collection now flowering on this table.

The bank of Ferns on the further side of the house is very fine, more particularly the huge *Angiopteris evecta*. There are also some fine tubs of various *Nephrolepis*, *Davallias*, *Aspleniums*, and *Adiantums*, all a fresh and lively green.

Passing from this house, where the annual Singapore flower shows are held, towards the office, two avenues, one leading towards the band-stand, and the other towards the aviary, strikes one's attention. The first is of *Cyrtostachys laxa* (*rendah*), the plants, although planted at the same time, varying from 3 feet to 20 feet in height, a curious phenomenon, for which there is no apparent reason. The lovely long red leaf sheaths of the Palm I have before mentioned.

The other avenue is of *Kentia McArthurii*, nearly all bearing seed, drooping racemes of small red berries the size of a small Cherry. On either side of this avenue are many single specimens of Palms, all carefully and distinctly labelled. Amongst these is a *Licuala paludosa*, a thick impenetrable mass, much like a *Rhapis*; *Hyophorbe Verschaffeltii*, a native of the Mauritius, in flower; *Oncosperma horrida*, the *Nibong*, its thick stems clothed with long black spines, and with a graceful spreading head; *Areca lutescens* is represented by a splendid mass some 15 feet high, and as much through, whilst a specimen of *Elaeis guineensis*, with a stem a yard in diameter, has leaves from 12 to 14 feet long in a thick round even head; *Caryotas* are well represented, as well as the curious *Martinezia caryotæfolia*, and near to the office, *Plectocomia elongata*, a curious plant, its main stem armed with rings of long thin spines with which to cling, resembles a snake in its habit. The specimen in question is growing horizontally, and for several yards is supported on Bamboo uprights.

The herbarium, in the same building as the library and office, contains a large collection of Malay plants, many of which Mr. Ridley is having painted by a clever Cingalese artist, a relation of the man who has done such good work for Dr. Trimen in Ceylon. I saw many of his results, and was surprised at the amount of detail in his work, and the dexterity with which he handles his brush.

The aviary and menagerie contain many interesting specimens. The principal approach is lined on each side by pretty rows of a graceful *Guatemala Palm*, *Synechanthus fibrosus*; the undeveloped young leaf stands straight up in the air like a needle, whilst others partially droop; the leaf-sheath encircling the stem is often 3 feet long.

Opposite this avenue is a grand bush of *Wormia suffruticosa*, 15 yards in diameter, a truly immense piece. It is almost as high, and its noble foliage, relieved by its pretty yellow flowers and buds, is very effective. From this point it is not far from the gate, and if one has made the tour so imperfectly described, one may be said to have had a pretty general view of the garden.

The experimental garden, commenced in 1884, is a little distance beyond the Botanic Garden proper. To reach it, one passes through an avenue of *Eugenia densiflora*, considered the best avenue tree for the island of Singapore. Its thick, leathery, large foliage is certainly calculated to shade thoroughly. Passing along this, one has the jungle on the right, in which *Bromeliads* grow and flower, and *Nepenthes Rafflesiana* pitchers freely. In this experimental and economic garden are all kinds of plants yielding dyes, oils, spices, resins, fibres, medicinal plants, &c., all carefully labelled and arranged as to their particular economic value. There is also a collection of Oaks, of which six or seven are indigenous to the island; their acorns are very large and handsome.

I called on the Sultan of Johore with the *Vicomte de Labry*; he received us kindly. The Sultan, on my expressing a wish to go to Johore, said his boat should fetch me across the Strait, and that his son should receive me.

The drive to Kangi, where one embarks for Johore, is some 15 miles right across the island, over a perfect road, and through the most lovely scenery; a most enjoyable trip.

The Strait is about three-quarters of a mile broad, but seven sturdy Malays soon placed me on the opposite bank, where I learnt, with regret, the Sultan's son was ill. However, I saw Mr. Kerr, the secretary of the club, who kindly showed me the very little there is to see in Johore. The Chinese are there in force, and here I saw for the first time their gambling-tables, not allowed in British possessions. The system of gambling is very simple, and dependent on which way a square of pith or wood, painted red and white, turns.

With Mr. Fox, I went up the highest peak in the island, named *Bukah Timah*. It is only a few hundred feet high. The road to its base is lined by the magnificent avenue of *Poinciana regia* (now, unfortunately, fast decaying, and being replaced by

Eugenia densiflora), which so struck Lady Braesey, and which she mentions in her *Voyage of the Sunbeam*. We also saw some fine Mangosteen, Coffee, and Pepper plantations. From the summit of this mountain a view of the entire island, with the many small ones off its shores, is obtained; a fine view.

On descending we left the road, and struck into the virgin jungle; I never came out of anything in such a mess in my life, or saw anything so wild and impressive of its kind.

We often passed, always descending the slope of the hill, beneath or above great fallen trunks, of the giant *Dipterocarpeæ*; by others so rotten, decayed or eaten by ants, that by the slightest of efforts one could poke one's stick right through into the trunks beneath our feet, over which we often scrambled and slipped, our sticks would sink nearly a foot, indeed broken reeds to lean on. Rhatans were in every direction, and it was impossible even to guess where they ended and often where they commenced. On the fallen rotten trunks were many *Sonerillas*, beneath the granite boulders small filmy Ferns, and at the base of the hill many specimens of *Angiopteris evecta*.

We also saw amongst many Aroids, the pretty *Alocasia singaporensis*. This hill is the only place in the island where granite is found, its huge boulders, slippery with mosses, assume the most peculiar shapes; beneath these boulders is the great hunting ground for rare and out-of-the-way plants.

Tigers, living on the wild pig, are often found in this jungle, and we passed more than one of the pits formerly used for their capture.

On the morning of the day on which this letter is posted, February 16, I am going to see a Mangrove swamp, also the other side of the island, but in another direction. In Singapore town, with the exception of the large Chinese quarters, there is not much to see.

The Chinese are in great force, more numerous than any other of the many races, I should imagine; some of them are fine, strong fellows, but their internal economy is not to be imitated.

The police amuse me much, there are four kinds, in four different uniforms, viz. Scotch (from Glasgow), Malay, Sikh, and Chinese.

The Scotch are in bad odour just now. It seems they are discontented, having been brought here rather under false pretensions. The Sikhs are magnificent fellows, all over 6 feet. The Malays vary from 4ft. 6in. to 5 feet, but are said to be plucky. I saw one go after a Chinaman in great style the other night. The Chinese—picked men from Hong-Kong—are on trial, and it is not yet known what will be the result. *James H. Veitch.*

(To be continued.)

SOCIETIES.

ROYAL HORTICULTURAL Scientific Committee.

DECEMBER 13.—Present: Dr. M. T. Masters, in the chair; Professor Oliver, Professor Church, Dr. Müller, Dr. Bonavia, and Rev. G. Henslow, Hon. Sec.

Garden Labels.—With reference to the value of leaden labels, Dr. Masters observed, that some of the same date (about 1774) as of those described at the last meeting, were still on garden walls at Gunnersbury. Dr. Bonavia observed that in India he had found porcelain or china labels with the name burnt in to be the most serviceable.

Abies Smithiana.—Professor Church observed that a fine tree existed at Shelsley Court, which in 1849 was about 120 or more feet in height. According to Paxton, this species was introduced from Kamaon in 1818, so that it was probably one of the earliest examples.

Malformed Orchid.—Mr. O'Brien sent a flower of *Cypripedium Chamberlainianum* having one of the petals standing above the lip in lieu of a sepal, a not uncommon occurrence.

Arbutus procerca.—Flowering sprays of this species were sent by Mr. G. Lee from trees, of which there were three stretching to a length of about 22 feet each. At 1 foot from the ground the trunk of one was 3 feet 6 inches in circumference. The trees were planted about forty years ago. They flower profusely, but never bear fruit. He observes that this species is not cultivated so often as it deserves to be.

Grindelia inuloides.—A flowering stem of this plant was forwarded by Rev. W. C. Dod. It is figured in the *Botanical Magazine*, t. 3737.

Peas Attacked by Mites.—A specimen of earth containing mites, which have proved injurious to Peas, was received from Mr. McDonald, of Jura Forest, Greenock. They were forwarded to Mr. Michael for further examination.

Dendrobium Fendleyanum, pseudobulb.—Sir Trevor Lawrence sent a bifurcating branch of this Orchid. He observes that "Dendrobium bulbs often make side-shoots from the 'eyes' at the apex of each segment, but this example seems to be a true bifurcation, due it would appear from the bend in the branch to some arrest of growth by a wire or another bulb." A microscopical examination appeared to confirm the above view, for the stem was single at the base, but a slight constriction began on one side, then a second appeared on the opposite side, higher up, until they deepened and met, thereby dividing the single stem into two.

BOTANICAL AND HORTICULTURAL OF NORTHUMBERLAND, DURHAM, AND NEWCASTLE.

DECEMBER 7.—The annual meeting was held at Cross House Chambers, Westgate Road, Newcastle, on the above date. Mr. J. Baxter Ellis presided.—Mr. J. J. Gillespie submitted the sixty-eighth annual report of the society. The council regretted that the surplus of £559 17s. 2d. shown in last year's account had been reduced to £412 5s. 6d. This was accounted for by the unfavourable weather at the spring show, and the fact that the Parliamentary by-election for Newcastle occurred on the second day of the autumn show. These circumstances materially affected the number of people who paid for admission to the show. Had it not been for these two causes, the council believed the year's working would have been a financial success. The Northumberland Agricultural Society intended to hold its show in Newcastle next year, and the society had agreed to amalgamate its interests with the Agricultural Society, and arrangements had been made by the two societies. It was hoped that the Town Moor Management Committee would grant the use of the North Road Recreation Ground for the purpose of the two shows. The society's flower show next year would be held in July, instead of August. The council had received and accepted with regret the resignation of Mr. James J. Gillespie, the secretary of the society. Mr. Gillespie, however, had agreed to serve as a member of the council. Next year's spring show had been fixed for April 19 and 20. The statement of accounts for the year showed the revenue to have been £1277 16s. 3d., and the payments £1425 7s. 11d., leaving a deficiency of £147 11s. 8d. The balance in hand was £112 5s. 6d., as against £559 17s. 2d. last year.

The chairman at the close of his remarks on the condition and prospects of the society, moved the adoption of the report. Mr. B. Plummer seconded, and echoed the chairman's remarks as to the determination of the society to go on with its work in spite of all difficulties. The motion was agreed to. Ald. T. G. Gibson was elected president, and the Mayor of Newcastle (Mr. E. Culley) vice-president of the society for the ensuing year. Members of the Council having been elected, the proceedings ended.

THE BOTANICAL SOCIETY OF EDINBURGH.

DECEMBER 8.—This Society met on the above date, Dr. Christison, President, in the chair. Professor Bayley Balfour exhibited a young carpel of *Cycas riminiana*, bearing ovules on its margins, from a plant at present in flower in the Botanic Garden.

Mr. Lindeay, Curator of the Royal Botanic Garden, exhibited a seedling of *Eichornia* (*Pontederia*) crassipes, showing the numerous long, nearly linear leaves, which are the first to appear, as well as a few of the earlier transition forms between these and the adult leaves.

The following specimens, all growing out-of-doors, were sent for exhibition by Mr. Campbell, of Ledaig:—Sprigs of *Escallonia macrantha*, *Genista fragrans*, two species of *Veronica*, and several examples of *Tritoma*, all in flower, as well as some buds of a *Passion-flower*.

The President exhibited a seed of *Ipomoea tuberosa*, found on the shores of Uist. He read a note by the late Sir Robert Christison, in which mention was made of three other species of tropical fruits, also found in Uist, and which had been sent him by Dr. Macdonald, of Lochmaddy. These were

Eatada gigantea, *Dolichos vulgaris*, and *Guilandina bonduc*, all West Indian fruits, carried by the Gulf Stream, and stranded on the outer Hebrides.

In a letter sent to Dr. Christison with the seed, Dr. Stewart, of Ardgour, mentioned that the natives of Uist call this seed "Ainne Moire" (Virgin Mary's Kidney, on account of the colour and the presence of a roughly marked cross on one of the surfaces. It was referred to by Martin in 1692, under the name of "Molluscan Bean," while Pentant calls it "Jamaica Bean."

In the absence of Dr. Stewart and Rev. D. Paul, M.A., Dr. Wm. Craig read a report on the excursion of the Scottish Alpine Club to Killin.

Professor Bayley Balfour next exhibited, by means of the oxy-hydrogen projection microscope, a series of slides, showing stages in the healing of a wound caused by lightning in a large Oak tree, where the wood and the bark had been separated by nearly half an inch over a considerable area of the trunk. The cambium, though split, had apparently been uninjured, and the part adhering to the wood had gone on forming wood, while that adhering to the bark had also formed wood in one direction, till the two wood surfaces met across the gap, and became fused by means of a callus formation.

Mr. Lindsay read the Report on the Temperature and Vegetation of the Royal Botanic Garden for November.

Report for November, 1892.—The month of November was dull and gloomy, but somewhat mild for the season. Storms of wind and rain were less frequent than usual, and no snow fell during the month. The thermometer was at and below the freezing-point on twelve mornings, indicating collectively 41° of frost for the month. The lowest readings were—on the 1st, 27°; 2nd, 27°; 17th, 26°; 18th, 27°; 19th, 26°. The lowest day temperature was 39°, on the 16th; and the highest, 57°, on the 11th. Very few plants are in flower, outdoor vegetation being now almost dormant. Fruit has disappeared rapidly from most trees and shrubs, with the exception of Holly, on which a good supply of berries still remain. On the rock-garden only two plants came into flower during the month, viz. *Helleborus altifolius* and *Gynerium argenteum*.

NATIONAL CHRYSANTHEMUM.

DECEMBER 19.—A largely-attended meeting took place at Anderson's Hotel, Fleet Street, on the above date, Mr. R. Ballantine in the chair. The Secretary brought up a report from the Schedule Revision Committee, who recommended that three exhibitions be held by the Society at the Royal Aquarium during 1893, viz. one on October 11, 12, and 13; one on November 7, 8, and 9; and one on December 5, 6, and 7—thus reviving the mid-winter show. It was also announced that the usual *Dahlia* and *Gladiolus* show would be held in September, on the 6th, 7th, and 8th, but by the Royal Aquarium Company, who would be responsible for the prizes for *Dahlia* and *Gladioli*, the Schedule sub-committee recommending that the sum of £20 be offered by the National Chrysanthemum Society for early Chrysanthemums. It was further stated the Royal Aquarium Society had concurred in these arrangements. The committee unanimously endorsed them. Mr. A. Taylor, East Finchley, laid upon the table a summary of the blooms shown at the Royal Aquarium on the occasion of the November show. From this it appeared that 2163 blooms were staged in the competitive classes, and of this number there were 1134 Japanese in 142 varieties, and 642 incurred in 75 varieties, the remaining 387 blooms consisting of reflexed, Pompon, large-flowered *Anemones*, Japanese *Anemones*, *Anemone* Pompon, singles and new varieties, not yet in commerce.

The Investigation Committee (formed of the officers of the Society), appointed to investigate the charges brought against a member of the Floral Committee in the pages of the *Journal of Horticulture*, by Mr. W. J. Godfrey, of Exmouth, made a report, which was adopted; and, after some discussion, it was recommended that no further action be taken in the matter.

In reference to a printed circular published by Mr. Wells, a resolution was passed expressing the strongest disapproval, on the part of the committee, of such conduct, and to warn the member referred to against a repetition of such irregularity.

On the question of the proposed enlargement of the show-boards, the schedule sub-committee reported they recommended that the matter of the size of exhibition-boards for Japanese blooms be left to the discretion of each exhibitor, in conformity with

the special regulation to that effect. This recommendation was adopted after considerable discussion.

The following resolution was carried on the motion of W. Herbert Fowler, Esq., "That all cups for exhibiting Japanese blooms be limited to 3 inches in diameter, and that no extra supports of any kind be allowed to the flowers. The Horticultural Society of New South Wales, the Christchurch (New Zealand) Horticultural Society, the Cambridge Chrysanthemum Society of New Zealand, and the Yeovil and also the Steyning Chrysanthemum Societies were admitted to affiliation. Twenty-one new members were elected, including three Fellows. The remaining business on the agenda was adjourned until a future meeting.

SCOTLAND.

ROUND EDINBURGH II.

The Edinburgh nurseries collectively form the centre and mainspring of the Scottish Horticultural trade. Some of them are very old-established; the books of Dickson & Co. go back to 1770. The two branches of the trade in which the nurserymen of "Fair Edina" excel is the rearing of forest trees from seed, and the growing of ornamental trees and shrubs. Hundreds of Scotch acres are devoted to these objects, and myriads of myriads would be an inadequate term to describe the incalculable number of seedling forest trees grown. An order of 1,000,000 could easily be lifted in any nursery. It would be hard to count such a number, one would think, but the employes have abundant practice in this kind of work.

The glass-houses are filled to a large extent with plants that are in great demand for decoration, and with those that stand best the gas and atmosphere of dwelling-houses. There are certain species for these purposes which are grown in greater or less quantities in every one of the nurseries. I give a list, so that the accounts may be more concise:—

Aspidistra lurida	Cocos Weddeliana
Araucaria excelsa	Latania borbonica
Ficus elastica	Kentia Belmoreana
Araha Sieboldi	Phoenix reclinata
Asparagus plumosus	Pteris tremula
Kangaroo Vine ?	„ serrulata

Aspidistra and the two Pterises are grown in greatest quantity at the "New Golden Acre" nursery (Mr. David Thomson's), one side of a long lean-to being staged with the former, and two wide span-roofs with the Ferns, while other houses are partially filled with them.

DICKSON & Co.

Messrs. Dickson & Co. have always commanded the respect of the commercial world of Scotland. As the nursery was founded long before the invention of railways, a great number of the old Scotch nobility have been customers from the establishment up to the present day. The firm is not only the oldest, but, also has the largest acreage, close upon 200 acres being under cultivation. The seed trade is increasing every year, owing to their exports. In garden seeds they annually grow 4 to 5 tons of the Liberton Select Brussels Sprouts, and great quantities of Pansy seed are sent to America and Australia. The largest and most important of their nurseries is at—

LIBERTON.

As the nursery here spreads over 100 acres, everything is grown on a large scale. The ground has only recently been put under cultivation, so it is well fitted for growing the vigorous and healthy fruit trees. In their catalogue, Messrs. Dickson, instead of giving a long list of varieties, give only what they have proved in their nurseries to be the most serviceable sorts to grow. Thus, in the Pear section, it is worded "The best twenty Pears in order of ripening," and so on all through the catalogue. Thirty thousand Apples are grown; budded stocks and maidens form a large fraction; 5000 of each representing the number of trained trees, and bushes and pyramids on the Crab; Apples on the Paradise are also grown in thousands. Cordon

Apples, too, are largely grown, although this mode of training is not much used in Scotland. The fact that 10,000 Victoria Plums are grown shows plainly how extensively Plums are grown. Pears and Cherries are on a smaller scale, but great breaks were covered with orchard Pears for the Clyde-side growers, the most grown varieties being Fair Maggie, Hesse, and Craig's Favourite. Fully half the nursery is devoted to raising forest trees. The situation is very exposed, and great care is bestowed on the layering and transplanting. English Oak, Beech, and the other deciduous hard-wooded trees are included in the term forest trees. As may be imagined from the great extent of ground, there is ample space to grow in quantities shrubs for cover and ornamental trees, such as Poplars, Maples, Horse Chestnuts, and purple Beeches. The new Canadian Populus (*P. canadensis aurea*), was easily distinguishable. The firm evidently expect from the number grown, a demand for it, and also for Acer Schwedlerii, and the Corstophine Plane, the last a variegated Sycamore well worth growing for the sake of contrast. Golden Elder, Sea Buckthorn, and the Double Scarlet Thorn are also much in evidence. Roses are extensively budded, mostly on the Dog Rose. For about 200 yards, a 12-foot border under a wall is devoted to double Primulas; for more than half were the double yellow, but there were also many hundreds of the double red, *Alba grandiflora*, and *Lady Jane*. Above the Primulas, *Heuchera sanguinea*, white and blue Hepaticas, and *Lychnis viscaria splendens* were planted to a less degree. There were also five rows of the rare *Veronica Salicorniodes*. The whole length of the wall behind the Primula is covered with trained Peach trees, also the wall at the further end of the nursery.

RED BRAES.

This nursery is mostly stocked with ornamental shrubs, Hollies, and Rhododendrons. There is a fine old Holly hedge at the entrance, indicating that the ground has been long used for a nursery. Many of the hardy Heaths were in flower, *Erica Searlei* being very floriferous, and the best winter Heath. Three vain-glorious Peacocks were strutting about, the damage they do being overlooked.

Gaultheria Shallon, *Spartium multiflorum album*, *Genista tinctoria fl.-pl.*, *Thuja orientalis*, which here assumes a deep brown colour, formed very noticeable rows. At one part this nursery is quite unique, and this feature will always distinguish it in my mind from any other. It is a fair-sized lake, with two Yew-clad islands in the middle. The curves of the lake on the nursery side are arc-shaped, and the steep bank sloping to it is densely planted with Hollies, Laurels, Weeping trees, and Conifers. The planting has been extremely well done, and the blending of the divers tints of green is lovely. At the head is a bank of Rhododendrons and Weeping trees. The wall side is flat, and small shrubs are planted so as to present two convex outlines. The lake had all the appearance, except for the background, of a lake formed in pleasure-grounds.

BONNINGTON.

The plant-houses of the firm are here; another name is Pilrig. They consist of conservatory and a long lean-to, into which seven or eight span-roofed houses open. The conservatory has Camellias in the centre; facing the entrance is a very large ten-stemmed *Abutilon*, *Boule de Neige*, which has to be cut back every year away from the roof. Greenhouse Rhododendrons and *Cliveias* (*Imantophyllums*), most of which are seedlings, occupied one stage of the first lean-to. Redbraes, a fine variety of the latter, was certificated. On the roof of one of the span-roofed houses was a *Stephanotis* going the whole length, and the roof of another was covered with Ivy-leaved *Pelargoniums*. Every sample of seed is proved before being sent out. *Seaforthia elegans* is grown here as a decorative Palm, and a pretty red-berried plant is *Ardisia crenata*. Herbaceous Calceolarias are a speciality, and are quite a sight when in flower. One long lean-to and a span-roof are devoted to Ivies in pots. The variegated forms of

H. Cavendishii (*marginata*), *H. elegantissima*, and *H. madeirensis* are largely grown. There is also a goodly stock of *Chrysocarpa*, *Betulifolia*, *marmorata elegans*.

The ground in front of the houses as far as the walk, roughly about 2 acres, is planted with herbaceous and florists' flowers. Prominent were border Carnations, Violas, Pansies, Thrift for edgings, Polyanthus, and Saxifragas. *Saxifraga Mawena* and *S. Wallacei* are completely covered with white flowers in spring. It is to be hoped that the inappropriate name of "Tufted Pansy" for *Viola* will be utterly abolished from their catalogue. *Vagabond*.

MR. MACKELVIE'S ORCHIDS.

Mr. Mackelvie shares with Mr. Buchanan, of Oswald House, the honour of owning the largest collections of Orchids in Edinburgh. The Vandahouse is entered from the conservatory. The first thing that strikes one on entering is the great number of tall Vandas; not content with his own Orchid giants, that are so well-known at the Edinburgh shows, Mr. Kelvie has lately bought some of Mr. Saunders' best specimens—a *Vanda suavis* fully 6 feet high, and a *V. tricolor superba* could be put beside it as a companion on equal terms. There were also specimens not quite so tall of *Vanda tricolor* var. *Veitchii*, var. *Hamilton Palace*, and var. *Dalkeith*. The last-mentioned was a superb variety; the labellum was longer, and of an intenser purple, and the crimson spots on the dorsal sepal were larger—this was most plainly seen at the edge. The Indian Orchid *V. coerulescens* and *V. Denisoniana* must also be included in the list of big specimens.

The next house was mainly devoted to *Cypripediums*, *C. Stonei* being in flower; the very rare variety of it, *C. Stonei* var. *platytanum*, had ten growths on it. Mr. White, of Arddarroch, I believe, offered 400 guineas for it. Another noticeable species was *C. O'Brienianum*. A *Cymbidium Lowianum* kept up the reputation for big plants, being a yard in diameter. The well-named *Epidendrum ciliare* was in flower; the proximity of a fine healthy *Oncidium ampliatum majus* made one regret that that beautiful Orchid was not in flower.

In the cool-house, plants of *Dendrobium Hillii*, *Cymbidium Mastersi*, a winter-flowering variety, although very large, could not compare with a row of *Cologyne cristata* on the opposite side. A *Cymbidium Lowianum* had twelve spikes on it. In flower were *Dendrobium thyrsofolium* and *Cypripedium villosum*. I shall never forget a house of this Dendrobe at Eaton Hall, the golden tints affording a brilliancy and variation of colour never seen in a house of crispums. *Vagabond*.

KINFAUNS CASTLE, NEAR PERTH.

It is difficult to conceive a more beautifully-situated residence than Kinfauns Castle, or one that has more attractions for travellers to or from Perth by train, or boat on the river Tay; and these attractions do not end with the castle, which is prettily embosomed among trees on the hill of Kinnoul. Mr. Goodfellow, the enthusiastic gardener, having told us that Kinfauns was the place to go and see fruit-growing well done, as soon as I entered the vegetable and fruit gardens a Peach wall facing south, and nearly 200 feet long, riveted my attention. I can truly say that it is many years since I saw such crops of ripening Peaches in the open. These fruits were of a good average size, and the colour on most of them was bright. What surprised me most was the quantity of Late Admirable ripening, as in gardens many miles further south it is rare (even in fine seasons) to get this variety to properly ripen under glass. Many of the earlier sorts had been gathered; a quantity of Dr. Hogg and Princess of Wales of good quality were on the fruit-room shelves waiting till they were ready for use. Nothing seemed particular about the borders. The walls are high and hollow, and fine shelter is had from lofty Beeches behind the wall; and Mr. Goodfellow says that the trees, when in foliage, seem to throw back bright light on the Peaches. The position is only about 15 feet above the sea-level. The starvation system

is not approved of at Kinfauns among any of the fruits, Apples, Pears, Plums, and Apricots being treated liberally, but the keeping of the roots near the surface is thought to be of much moment.

Apricots on a wall facing south were, like the Peaches, in capital condition, and the last of the crop had been gathered. I saw enough to convince me that there was a decided success in Apricot culture. While examining the roots, I observed that the trees stood on a terrace about 7 feet wide. A range of glass structures in close proximity to the Apricots seemed to shade them, but I was assured by Mr. Goodfellow that it was an advantage to the trees instead of being harmful, the trees being remarkable for health and vigour. The variety mostly in favour was the Moor Park, which in some places is more liable than others to fall a victim to disease.

I noticed the good effect of wall culture on Apples. Celini was remarkable for its size and bright colour. Of Pears of fine size, mention may be made of Conseiller de la Cour, Beurré Rance, and Beurré Baltet. Such a capital second crop of Raspberries at the end of the month of September is not often witnessed as that at Kinfauns. This is accomplished by plenty of muck, liquid and solid. Morello Cherries were in fine form, and the trees in robust health, and seemingly in good preparation for a crop in 1893. It is the previous year's preparation which makes a good crop of Morello Cherries possible in the North. I had to discuss the Strawberry management as I went along. The crops of Strawberries are very heavy, and the fruits of fine size, yet this result is obtained by the old-fashioned plan of digging deeply between the rows early in the autumn; and Mr. Goodfellow will attempt no other at Kinfauns. The foliage was strong and very healthy. No doubt the new crop of roots was quickly formed and supplying the plants, which were forming fine crowns. I know some cultivators who do not only remove part of the roots by this digging and dunging; Mr. Goodfellow does not do much of the latter, as he is afraid of over-luxuriance of foliage.

In the glass structures, Grapes are grown in quantity—no stinting of crops; Lady Downes' and Mrs. Pince were the varieties valued from this time onward. Plants are chiefly grown for cutting and table decoration, as they are in most places, and large breadths of useful species are grown outside for the same purpose. Among bedding plants, I noticed some fine Chilian Beets (home-saved), and Begonias, better than I have seen them in the open air this year. *M. Temple.*

VARIORUM.

THE USES OF THE BAOBAB.—Few trees of tropical countries are better known than the Baobab (*Adansonia digitata*). On all points it is an interesting tree, whether we consider the great age that has been attributed to it, its massive trunk and peculiar growth, or the various uses to which different parts of the plant are put by the people where the tree is common. Though the tree is a native of many parts of Africa, it is cultivated in other warm parts of the world. At one time it had the reputation of being the largest tree in the world, but the Californian *Sequoia gigantea* and the Australian *Eucalyptus globulus* and *E. amygdalina*, and now the *Taxodium mucronatum* (figured in the *Gardeners' Chronicle*, November 26, this year), leave it far behind, so far as height goes, for the tallest Baobab—or Monkey-bread tree, as it is sometimes called—does not exceed 60 or 70 feet. It is in its girth, however, in proportion to its height that this tree is remarkable, some trees measuring 30 feet in diameter. This broad trunk divides at no great height from the ground into numerous thick branches, bearing a dense mass of deciduous leaves, amongst which the large solitary pendent flowers on long stalks are an attractive feature, as are also the woody fruits, which measure from 8 to 18 inches long, and are not unlike a Gourd in shape. These fruits are filled with a

mass of pleasantly-acid pulp, from which the natives make a pleasant and refreshing drink. Many of the largest trees in tropical Africa are considered to be of very great age. The Baobab was, indeed, considered by Humboldt as the "oldest organic monument of our planet." Adanson reckoned one tree, which measured 30 feet in diameter, to be 5150 years old. With trees of such a size, and undoubtedly

FIG. 125.—A NEW PUDDING-BASIN.

FIG. 125.—SECTION OF BASIN.

of great age, it is only natural to expect to find a very thick deposit of bark upon the trunks; and when we consider that the genus *Adansonia* belongs to a section of the order Malvaceæ, which are noted for their fibrous barks, we should further expect that Baobab bark should be turned to same account. The fact is, that the bark furnishes a material for ropes and cordage amongst the natives, and is considered to possess great strength and durability.

FIG. 127.—OSTEOLOGY IN THE GARDEN. (SEE P. 765.)

Some years ago attention was directed to it in this country as a paper material, and excellent paper was made from it, but it has never come into regular use; indeed, had a demand sprung up for it, the supply would in the course of a short time have failed, for the bark is not sufficiently rapid in its formation to meet a constant drain upon it. About five or six years ago, Baobab bark was applied to another use in this country, namely, for making travelling caps for gentlemen; they were soft, close-fitting, warm, and comfortable to wear, but they never became generally used. The fibre of this bark seems, however, to

be an article of export from tropical Africa, as it is referred to in a recent consular report from Loanda, as one of the exports that has almost ceased. The natives, it is said, will not take the trouble to bring it in, as it is bulky, and not so valuable as other produce. This, the Consul remarks, "is greatly to be deplored, as it will lead to substitutes being used, and the fibre trade dying out. There have been several inquiries from Europe lately as to whether supplies may soon be looked for, but it is to be feared that it will not be exported again from Loanda in any quantities." In Senegal, it is said that the fibre is woven into cloth, but the most general way of making native cloths is to remove the outer bark, and beat the inner bark with mallets till it becomes soft and pliable—similar, indeed, to the well-known Tapa cloth of the Pacific Islands. *John R. Jackson, Museum, Kew.*

NEW INVENTION.

THE LORD MAYOR'S PUDDING-BASIN.

AN appropriate illustration for the season is a pudding-basin such as is afforded in fig. 125. Hitherto, puddings, if we may trust the memory of "the oldest inhabitant," have been cooked in earthenware basins, whilst this, the most modern utensil for the purpose, is fashioned of thick block tin. By its use the pudding, whatever the kind, is prevented from becoming soppy on the top, or losing its juices in the water in which it is cooked; and it is as well cooked at the top as at the bottom. These are points in its favour that will appeal to all good housewives, and the more durable nature of the tin as compared with earthenware will likewise be appreciated by them. A is the cover fastened down on the pudding by a bit of string passed over it and through two small loops which project from the rim; B is a false bottom that fits lightly when the basin is filled, which is useful, as enabling the cook to push out the contents if these should stick fast.

The sole licensees and manufacturers of the above are Messrs. Griffiths & Browett, Limited, 68, Bradford Street, Birmingham.

A NEW FRAME FOR HIVES.

THE writer has just had a new frame submitted for an opinion as to its merits. It may be described as an improved "Simmins" frame, which he has used for a number of years himself, and has advocated from time to time, as possessing many advantages over others. The top bar of the "Simmins" frame is $\frac{3}{4}$ inch deep, and therefore always remains rigid, whatever weight it has to carry in honey, or in sections piled on the top. Its depth also enables the beekeeper to grasp it in the middle with the finger and thumb of one hand, so that it can in this way be lifted out of the hive, the other hand remaining at liberty for capturing the queen or any other purpose. Little or no brace is built on the tops of these frames, this being a great point in their favour. The improvement consists of an arrangement both simple and expeditious for fixing in the foundation, as formerly the only way was by running it in with melted wax. The frame is likely when it is known, to come into general use; and the maker talks of registering the design. The price is very moderate, as it can be sold at the rate of 1s. 6d. per dozen. *Expert.*

Obituary.

WILLIAM HEALE.—On December 8, there died, at Easterton, Wilts, in his 84th year, WILLIAM HEALE, son of the late William Heale, of the Nurseries, Calne and Chippenham, and who was for many years nurseryman and seedsman at Devizes. He was an ardent horticulturist and a sound pomologist, and with him passes away the last of the batch of enthusiasts of the great Dahlia and Rose decade of nearly half a century ago.

MARKETS.

COVENT GARDEN, December 22.

[We cannot accept any editorial responsibility for the sub-joined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they fluctuate, not only from day to day, but often several times in one day. ED.]

A FAIR Christmas trade has been done during the week, with no alteration in prices, and supplies especially good. James Webber, Wholesale Apple Market.

POTATOS

The market for English Potatoes is almost at a standstill, owing to the large arrivals of foreign, which are very fine in quality, and in splendid condition, and selling at from 50s to 60s. per ton. Best English selling at from 7s. to 90s. J. B. Thomas.

SEEDS.

LONDON: Dec. 21.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., write that, as is usual towards the close of the year, the seed markets this week present quite a holiday appearance. Values generally, in the absence of business, show considerable firmness. Alyske and white are, however, both somewhat lower. Trefol keeps steady. There is no change in grasses. Kornigsburg Tares, notwithstanding their cheapness, are neglected. For Rape seed higher prices are asked. White and brown Mustard continue scarce and dear. The demand for Peas and Haricots is meagre. Hemp and Canary seed, like a 1 other articles just now, are inactive.

FRUITS AND VEGETABLES.

BOROUGH: D. C. 20.—Quotations:—Cabbages, 2s. to 2s. 6d. per tally; Cauliflowers, 1d. to 1s. 3d. per dozen; Spinach, 1s. to 1s. 6d. per bushel; Brussels Sprouts, 1s. to 1s. 3d. per half-sieve; Carrots, 2s. 6d.; Turnips, 1s. 6d.; Parsley, 1s. 6d. per dozen bunches; English Onions, 5s. to 6s. 6d.; Dutch do., 4s. 6d. per cwt.; Horseradish, 1s. 6d. to 1s. 9d. per bundle; English Apples, 3s. 6d. to 10s. per bushel.

SPITALFIELDS: Dec. 20.—Quotations:—Prices to-day are unaltered from those of last week.

FARRINGTON: Dec. 22.—Quotations:—Carrots, Bedford, 47s. to 50s. per ton; Cauliflowers, 5s. to 7s. per tally; Celery, 10s. to 11s. per doz.; Sprouts, 1s. to 1s. 3d. per half-sieve; English Onions, 4s. 10s. to 5s. 10s. per doz.; Parsnips, 60s. do.; Turnips, 40s. to 45s. do.; Horseradish, 1s. 9d. per bundle; American Golden Russets, 14s. to 16s. per barrel; Almeida Grape, 15s. per box; Florida Oranges, 8s. to 11s. per case.

POTATOS.

BOROUGH: Dec. 20.—Quotations:—English Magnums, 50s. to 65s.; Hebrons, 60s. to 70s.; Snowdrops, 60s. to 75s. per ton.

SPITALFIELDS: Dec. 20.—Prices to-day are unaltered from those of last week.

FARRINGTON: Dec. 22.—Quotations:—Magnums, Bedford, 60s. to 65s.; Imperators, 55s. to 60s.; Main Crops, 90s. to 100s.; Hebrons, 80s. to 90s.; Sutton's Abundance, 80s. to 90s.; Lincoln Magnums, 60s. to 65s.; Lincoln Imperators, 60s. to 65s.; Blacklands Magnums, 50s. to 55s. per ton.

GENERAL AVERAGES: Dec. 21.—Magnums, 50s. to 75s.; Hebrons, 60s. to 80s.; Snowdrops, 60s. to 80s.; Imperators, 60s. to 70s. per ton.

CORN.

Averages.—Official statement of the average prices of British corn, imperial measure (quarter) for the week ending December 17, and for the corresponding period last year:—1892: Wheat, 26s. 4d.; Barley, 24s. 6d.; Oats, 10s. 10d. 1891: Wheat, 36s. 10d.; Barley, 29s. 6d.; Oats, 21s. 4d.

HAY.

Averages.—The following are the averages of the prices at the principal metropolitan markets during the past week:—Clover, prime, 80s. to 115s.; do, inferior, 50s. to 75s.; hay, best, 75s. to 112s.; do, inferior, 50s. to 65s.; and straw, 28s. to 41s. per load.

THE WEATHER.

[By the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

The districts indicated by number in the first column are the following:—

- 0, Scotland, N. Principal Wheat-producing Districts—
- 1, Scotland, E.; 2, England, N.E.; 3, England, E.;
- 4, Midland Counties; 5, England, S.
- Principal Grazing, &c., Districts—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.;
- 10, Ireland, S.; (* Channel Islands.)

THE PAST WEEK.

The following summary record of the weather for the week ending December 17, is furnished from the Meteorological Office:—

"The weather during this period was mild and unsettled as a whole, but during the early part of

the time the nights were occasionally sharp and frosty. A good deal of rain was experienced in the extreme north and west, but in the east the falls were slight and less frequent.

"The temperature was above the mean very generally, the excess ranging from 2° in the north and east, to 3° in most of the western districts, and to 4° over southern and central England, and in the south of Ireland. The highest of the maxima were recorded on the 15th in most parts of England and Ireland, and on the 17th in Scotland; they ranged from 56° in 'Ireland, S.' and 55° in 'Scotland, E. and W.,' 'England, S.,' and the 'Channel Islands,' to 53° in some of the English districts, and in 'Scotland, N.' The lowest of the minima were registered either on the 11th or 14th, when they varied from 24° in 'England, N.W. and S.W.,' to 31° in 'Scotland, N.,' and to 35° in the 'Channel Islands.'

"The rainfall exceeded the mean in 'Scotland, N.,' and just equalled it in 'Ireland, N.,' in all other districts there was a deficit.

"The bright sunshine was less prevalent than during the preceding week. In Ireland and Scotland the amount recorded was less than the normal for the time of year, but in most of the English districts there was a slight excess. The percentage of the possible duration ranged from 26 in 'England, N.E.,' and 23 in 'England, S.W.,' to 9 in 'Ireland, N.,' and to 4 in 'Scotland, N.'"

NOTICES TO CORRESPONDENTS.

BLACK SOAP, &c.: R. F. Soft soap. Paraffin is distilled from bituminous shale; petroleum is a natural oil. The latter only is meant.

BOOKS: *Cretica. Domestic Floriculture*, by Burbidge. Published by Blackwood & Sons, London.

BREAD FRUIT: *Bread fruit*. *Artocarpus incisa*, a native of Papua and the South Sea Islands, and cultivated in the West Indies; *A. integrifolia*, a native of the Indian Archipelago, is the so-called Jack-fruit. The Bread-fruit tree of North Australia is *Gardenia edulis*. Native Bread of Australia is *Mylitta australis*. We never heard of the name Bread-fruit being applied to the Banana, as you suggest.

CEDAR AND RHODODENDRON TRIMMINGS AND WATER LILY: R. M. The second named are sometimes injurious to live stock if eaten in a withered state and in large quantities, but the others are not likely to be so.

FUNGUS ON FERNS: E. J. L. The fungus on the Ferns is apparently *Mileisia polypodi*, White, found first in Scotland, but not before known by me in England. The filaments are those of a moss, long drawn out, resembling those of *Fonticula antepyreica*. M. C. C.

FUNGUS FOUND AT A DEPTH OF FOUR FEET: G. P. Evidently a *Polyporus*, but it is impossible to say which species. It was probably on some old tree roots.

INSECTS: *Destructive Caterpillars*. The long and rather slender white caterpillar found in dark damp red sandstone is evidently that of one of the swift moths (*Hepialus* sp.), easily found and as easily killed by treading upon. I. O. W.—J. Adams. The larva of two species of the Daddy Longlegs or Crane-fly (*Tipula*). The eggs must have been laid in the soil before it was cut from the field, or in the rough herbage that may have been left to grow on it whilst lying in a heap. It will be advisable another time to obtain soil from another source—one on which sheep have been fed in the autumn, and therefore with close herbage, affording no harbour for the fly (*Crane-fly*), and where the trampling of the animals would prevent eggs being laid or hatched. To drive them from the pots, try lime decanted in a clear state before use, and collect all that may be found crawling about the greenhouse.

KOWHAI: D. P. The native name for the New Zealand tree, known as *Sophora tetraptera*. It is very ornamental, but only half-hardy. For figure and description, see *Gardeners' Chronicle*, June 8, 1878.

MARGUERITES DYING OFF: R. G. in B. H. The work probably of weevil grubs or wireworm. Send specimens of the depredators for inspection, packing them in damp mould or Cocoa-nut fibre refuse.

MARKREB CASTLE: G. W. D'Arcy. Under consideration.

MANURES FOR VINE BORDERS: A. P. In making new Vine borders, in size 30 feet by 10 feet by 2 1/2 feet, 3 cwt. kainit and 5 cwt. basic slag should be incorporated with the soil. For top-dressing an old border of the same size, mix 14 lb. of kainit with 19 lb. of basic slag, and apply at the rate of 1 lb. per square yard. Mineral phosphates are ground coprolites, apatites, or basic slag, and mineral super-phosphates are ground coprolites, or apatites, &c., rendered more soluble by being acted upon by sulphuric acid. The former are used along with large quantities of organic matter, the latter when these are scarce. J. R.

NAMES OF FRUITS: J. G. 1, Brabant Bellefeur; 2, Hornead Pearmain; 3, Wyken Pippin; 4, King of the Pippins; 5, Ecklinville Seedling; 6, not known; 7, Hanwell Souring.—Wm. Fry. Apple Kentish Gaff.—E. Pratten. 1 and 4, Blenheim Orange; 2, Golden Reinette; 3, Scarlet Russet; 5, Schoolmaster; 6, not recognised.—W. R. G. The tuber is a variety of Solanum tuberosum, known as Vitelotte, a common continental variety. Fruits next week.

NAMES OF PLANTS: A. P. Bulbophyllum hirtum; notice the dimorphic flowers.—J. J. W. Cyclamen coum. Crocus not known, malformed Primrose; all were withered, almost beyond recognition.—H. J. R. Dendrobium bigibbum.—W. G. S. Broad-leaved specimen Acacia longifolia, probably; the other unrecognised.—E. J. W. We cannot undertake to name varieties of Chrysanthemums from blooms sent up. Yes, there is an incurved variety known by the name you mention.

PORTUGAL LAUREL HEDGE: A. It is probable that the plants, whose leaves change colour before the plants die, are affected with the silver-leaf disease, the cause of which is unknown. The same mysterious disease attacks the Plum. Destroy by burning all affected plants, and impart vigour to the hedge plants by mulching the soil along both sides with decayed manure, and affording liquid manure in a weak condition occasionally during the growing season. The constant annual cutting of the shoots is usually resented by the Laurel, and it is rarely that a hedge of these plants can be kept in good health for many years.

ROMAN HYACINTH: T. R. The flowers are good, as is also the stock.

SPORT IN LAURBURN: D. P. Doubtless, the well-known Cytisus Adami, which excites so much astonishment every year. It is interesting to know that it has been produced in New Zealand.

THE QUEEN OF FLOWERS: A. This is generally applied to the Rose, but our forefathers sometimes applied it to the Tulip, for we find one Docteur Jean Posthius, as cited by Monardes, writing, La Tulipe Roynne des Fleurs, Venu des Coutaux Getiques, Surpasse en Divers Couleurs, Les Champestres et Domestiques.

THE TEIL TREE: D. In Isaiah vi., 13, you will find it thus written, "as a Teil tree, and as an Oak, whose substance is in them, when they cast their leaves: so the holy seed shall be the substance thereof." What "teil" means, indeed what the whole passage means, we do not know. In Barker's Bible (1615), the version is "and shall be eaten up as an Elme, or as an Oke, which have a substance in them when they cast their leaves." The passage in the Revised version is doubtless more correct. It runs "shall be eaten up as a terebinth and as an Oak, whose stock remaineth when they are felled so the holy seed is the stock thereof."

VICTORIA REGIA NOT FLOWERING: A Constant Reader. The water was probably kept warm enough, although 75° would have been better. What was the temperature of the house? It should have been from 10° to 15° at the commencement of the season, and from 20° to 25° higher than that of the water in June and July.

COMMUNICATIONS RECEIVED.—E. S., Palo Alto, California.—E. J. L.—H. K., Laeken.—W. T. D.—A. H. B.—A. P. B.—H. Correvon, Geneva.—T. C.—R. O.—G. C. C.—C. B. C.—W. H. D. H., Quito.—G. Copies of each Journal are filed at the above Offices for the use of Advertisers.

THE "WORCESTER HERALD,"

ESTABLISHED 1794.

The Leading County Paper. Extensive circulation among the upper and middle classes in Worcestershire and adjoining counties. Advertisers would do well to forward for reference and distribution plans and particulars of Estates, Catalogues of Machinery, Furniture, Books, and other Property advertised in the Columns of the "HERALD."

Sales of Stock and Agricultural Effects.

The "WORCESTER HERALD" is the most effective organ for giving publicity to announcements of this class. It is the leading Agricultural Paper in the County, and circulates most extensively among Agriculturists in and around Worcestershire.

Farms to Let.

Land Agents, Estate Managers, and all having Farms to Let would do well to advertise in the "WORCESTER HERALD," the Leading County Paper. Specially adapted for bringing such notices before Tenant Farmers. Large circulation. Moderate charge.

Situations Vacant and Wanted.

For producing results the "WORCESTER HERALD" is recognised as a specially good medium. Cheap Rates. Apply for terms.

SPECIMEN FREE. Price 2d.

Published Friday for Saturday.

OFFICES:—72, HIGH STREET, WORCESTER.

THE GARDENERS' CHRONICLE

PUBLISHER'S NOTICES.

GARDENERS' CHRONICLE TELEGRAMS.—The Registered Address for Foreign and Inland Telegrams is "Gardchron, London."

ADVERTISEMENTS.

Scale of Charges for Advertising.

Head Line charged as two.

Table with 4 columns: Line number, Lines, Price (£0 3 0), and Line number, Lines, Price (£0 8 6). Rows 4-14.

AND SIXPENCE FOR EVERY ADDITIONAL LINE.

If set across two Columns, the lowest charge will be 20s.

If set across three Columns the lowest charge will be 30s. Page, £8; Half Page, £4 10s.; Column, £3.

NOTICE TO ADVERTISERS.—In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all. Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisements which they wish repeated.

GARDENERS AND OTHERS WANTING SITUATIONS 26 words, including name and address, 1s. 6d., and 6d. for every additional line (about nine words) or part of a line. These Advertisements must be prepaid. This scale does not apply to announcements of Vacant Situations, which are charged at the ordinary scale. Births, Deaths, and Marriages, 5s. each insertion.

POSITION.—Advertisers are specially requested to note, that under no circumstances whatever can any particular position be guaranteed for advertisements occupying less space than an entire column.

POSTAL ORDERS.—To Advertisers, Subscribers, and Others.—It is very important in remitting by Postal Order that it should be filled in payable at No. 42, DRURY LANE, to A. G. MARTIN, as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

N.B.—The best and safest means of Remitting is by POST-OFFICE MONEY ORDER.

Advertisements for the current week MUST reach the Office not later than Thursday noon.

All Advertisements should be addressed to the PUBLISHER.

Publishing Office and Office for Advertisements, 41, WELLINGTON ST., STRAND, W.C.

SUBSCRIPTIONS.

All Subscriptions payable in advance. The United Kingdom, 12 months, 15s.; 6 months, 7s. 6d.; 3 months, 3s. 9d. All Foreign Subscriptions, including Postage, 17s. 6d. for 12 months; Post-office Orders to be made payable at the Post-Office, 42, Drury Lane, W.C., to A. G. MARTIN.

Subscribers who experience any difficulty in obtaining their Copies regularly, are particularly requested to communicate with the Publisher (in cases of delay in the delivery by post, the cover should be forwarded with complaint).

THE GARDENERS' CHRONICLE

("THE TIMES OF HORTICULTURE")

A Weekly Illustrated Journal

(Established 1841)

Among the Correspondents & Contributors to recent Volumes the following, out of many Hundreds, may be named:—

WANTED, an ASSISTANT SHOPMAN, with Nursery experience.—Accustomed to brick Counter Trade.—Apply, stating age, experience, and salary expected, to J. AND R. THYNE, Seedsman, Glasgow.

WANT PLACES.

TO GARDENERS, AND OTHERS SEEKING SITUATIONS.

The Pressure upon our space at this season of the year is so great, we are compelled to state that advertisements received after 6 P.M. on Wednesday will, in all probability, be held over to the next week.

Advertisers are cautioned against having letters addressed to initials at Post-offices, as all Letters so addressed are opened by the authorities and returned to the sender.

Gardeners, Farm-Bailiffs, Foresters, &c.

DICKSONS, Royal Nurseries, Chester, are always in a position to RECOMMEND MEN of the highest respectability, and thoroughly practical at their business. All particulars on application. Telegraphic and Postal Address—"DICKSONS, CHESTER."

F. SANDER AND CO. can recommend several highly qualified and energetic HEAD and UNDER GARDENERS, of excellent character, and proved ability; men thoroughly fitted for all the various duties of their profession. For all particulars, please apply to—F. SANDER AND CO., St. Albans.

RICHARD SMITH AND CO. beg to announce that they are constantly receiving applications from Gardeners seeking situations, and that they will be able to supply any Lady or Gentleman with particulars, &c.—St. John's Nurseries, Worcester.

To Noblemen and Gentlemen requiring Land Agents, STEWARDS, BAILIFFS, or GARDENERS.

JAMES CARTER AND CO. have at all times upon their Register reliable and competent MEN, several of whom are personally well known to Messrs. Carter. Enquiries should be made to 227 and 238, High Holborn, W.C.

GARDENERS.—Our complete and extensive register of GARDENERS OPEN FOR ENGAGEMENT is at the service of any Lady or Gentleman wishing to secure the services of trustworthy reliable men.—DICKSONS AND CO., 1, Waterloo Place, Edinburgh. Established over a Century.

GARDENER (HEAD); age 35, married.—Mr. W. SWAN, Gardener and Steward to J. P. Bryce, Esq., Bystock, Exmouth, can with every confidence recommend a thoroughly practical man conversant with the requirements of a large establishment and all things pertaining to Horticulture. First-class Orchid Grower and General Plantsman. Highest possible character.

GARDENER (HEAD); age 30.—J. DUMBLE, Gardener to Sir Charles Philipps, Bart., Picton Castle, Haverfordwest, is desirous of recommending his General Foreman, H. Butcher, to any Lady or Gentleman requiring a thoroughly competent man. He has a good knowledge of the different branches of Gardening, is well acquainted with the Cultivation of Fruit (Indoo and Out), Flowers and Vegetables, is also a good hand at Table Decorations.

GARDENER (HEAD), age 39, married.—J. HUNTER, gardener to the Earl of Durham, Lambton Castle, Fence Houses, can with every confidence recommend his late Foreman, Frederick Taylor, to any Lady or Gentleman in want of a thoroughly capable gardener.

GARDENER (HEAD).—W. B. FISHER, Gardener to the EARL CAWDORE, Stackpole Court, Penarth, will be pleased to recommend Charles Davies to any Lady or Gentleman who is in want of a first-class man.

GARDENER (HEAD).—Age 32, married, no family. A GENTLEMAN wishes to highly recommend his Head Gardener as a thorough practical man.—COLE, The Gardens, Fogleigh, Box, Wilts.

GARDENER (HEAD).—Age 37, married, no young children; an experienced man is thoroughly recommended.—GARDENER, Lindley Hall, Nuneaton.

£5 BONUS will be given for information leading to Advertiser's appointment as HEAD GARDENER, where five or more are kept.—Age 40, single till suited; twenty-four years practical experience. Highly recommended.—W. BARNES, Himley Hall Gardens, nr. Dudley.

GARDENER (HEAD WORKING).—Age 29; one child, aged five years; thirteen years' experience in good gardens; good testimonials.—F. WELLS, 29, Hampstead Road, Dorking.

GARDENER (SECOND, or SINGLE-HANDED).—Age 39, married; experienced both Inside and Out. Good character.—W. STONE, Field's Cottages, Southam, Warwickshire.

GARDENER (UNDER).—Age 27; twelve years' experience Inside and Out. Can be highly recommended. Abstainer.—T. MUSSELL, The Gardens, Few Park, Enstone, Oxon.

GARDENER (UNDER).—Quite willing to make himself generally useful. Abstainer. Good character.—W. S., The Village, Halstead, Kent.

FOREMAN.—Age 26; eleven years' experience in good establishments.—For further particulars and references apply C. CARR, Sunnyside, Workson, Notts.

JOURNEYMAN (FIRST).—Thoroughly experienced in general Routine. Six years' reference from good Gardens.—SEALY, Northfield, Tetbury, Glos.

JOURNEYMAN, in the Houses; age 22.—Mr. S. A. WOODS, Osberton Gardens, Worksop, will be pleased to recommend J. Ailsop as above. Two years in present situation.

IMPROVER, in a Market Flower Nursery.—Age 18; four years' experience. Surrey preferred.—F. J., 54, The Chase, Clapham Common, London, S.W.

To Gentlemen, Gardeners, and Nurserymen.
HANDY-MAN (PAINTER, GLAZIER, and FITTER) wants employment; Job not objected to; any district. Good reference.—24, Manor Lane, Lee, Kent.

TRAVELLER, in Foreign Parts.—A young German, age 30, with perfect knowledge of English, French, and Spanish, having travelled for over six years in the interior of Peru, and having become expert in the management of Orchids, wants Situation as above. First-class references. Z. H., 046, Invalidendank, Dresden, Saxony.

HOLLOWAY'S PILLS.—There is nothing in the whole "Materia Medica" like these Medicaments for the certainty of their action in lumbago, sciatica, tic doloureux, and all flying or settled pains in the nerves and muscles. Diseases of this nature originate in bad blood and depraved humours, and until these are corrected there can be no permanent cure. The ordinary remedies afford but temporary relief, and in the end always disappoint the sufferer. Holloway's Ointment penetrates the human system as salt penetrates meat, and the Pills greatly assist and accelerate its operation by clearing away all obstructions and giving tone to the system generally. The prophylactic virtues of Holloway's remedies stand unrivalled.

RUSSIA MATS.

Rooms, 67 and 68, Cheapside, London, E.C., on WEDNESDAY
NEXT, January 4, at 12 o'clock.
On view morning of Sale, and Catalogues had.

Friday, January 6, 1893.

MESSRS. PROTHEROE AND MORRIS have
received instructions to SELL by AUCTION, at their
Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on
FRIDAY NEXT, January 6, at half-past 12 o'clock, a superb
importation of the

UPPER BURMAH DENDROBIUM NOBILE

(WILL BE IN FULL BLOOM NEXT MONTH),
in grand condition, well set for flowering.
From every side we have heard glowing accounts of our last
year's importations, the Albino forms being very freely
represented.

Also a fine batch of the LANG-TANG VARIETY of
DENDROBIUM NOBILE,
the short thick bulbous species, which are absolutely new to
Europe, and are untried. They are most distinct in appear-
ance, evidently free in growth, and we recommend them with
the utmost confidence.

The Sale will include
PHAIUS SANDERIANUS VAR.
LELIA GRANDIS, of the old original form, and not to be
confused with L. g. tenebrosa, or the small variety of the
species sometimes sold as L. grandis.

A fine lot of CATTLEYA LEOPOLDII, Pernambuco variety,
described in the *Gardeners' Chronicle* of December 24th by
Mr. J. O'Brien.

DENDROBIUMS and CYPRIPEDIUMS from the Lushsi
Country. See Drawing.
Choice HYBRID DENDROBES in FLOWER and BUD.
MILTONIAS, EPIDENDRUMS, MAXILLARIAS, &c.
By order of F. SANDER AND CO., St. Albans.
On view morning of Sale, and Catalogues had.

Blenheim Palace Gardens, near Woodstock.

favoured with instructions from the Executors of His
Grace the Duke of Marlborough, deceased, to SELL by
AUCTION, on the Premises, Blenheim Gardens, near Wood-
stock, on TUESDAY and WEDNESDAY, January 10 and 11,
1893, at 12 o'clock precisely each day, the whole of the choice

STOVE and GREENHOUSE PLANTS,
comprising 1000 PALMS, consisting of several fine Specimen
Kentias, also a large number of smaller plants in No. 48 and
32-pots, and other kinds.

700 SPECIMEN CARNATIONS, SOUVENIR DE
MALMAISON,
consisting in equal proportions of the Dark and Pale varieties
now coming into flower—the finest lot of plants ever offered;
1000 smaller Plants; also—

5000 TREE CARNATIONS,
comprising all the finest varieties in cultivation; 250
AZALEAS, 300 CYCLAMEN, quantity of EUCHARIS, ASPID-
DISTRAS, POINSETTIAS, BOUARDIAS, 150 PANCRAT-
TIUMS,

5000 POT ROSES,
Fine POINSETTIAS in Flower; ASPARAGUS PLUMOSA;
1000 CHRYSANTHEMUMS, BOUARDIAS, Specimen
IMANTOPHYLLUM, some enormous examples of the finest
variety of ANTHURUM SCHERZERIANUM; fine pieces of
LAPAGERIA ALBA.

3000 DOUBLE WHITE PRIMULAS,
In flower, a grand lot of plants, and embracing the best
varieties; a large assortment of

3000 EXOTIC FERNS,
Comprising the choicest varieties in cultivation, some fine
pieces of Stephanotis floribunda, and a great variety of other
plants.

May be viewed any day prior to the Sale. Catalogues may
be had of Mr. T. WHILLANS, the Head Gardener, on the
Premises; and of the Auctioneers, Estate Agents and Valuers,
Central Sale Rooms, 67 and 68, Cheapside, London, E.C.

Wednesday and Saturday Next (Weather Permitting).

R. OWEN, Floral Nursery, MAIDENHEAD.

**MUCH THE BEST NEW CHRYSANTHEMUM OF THE YEAR,
"GOLDEN WEDDING."**

VERY MUCH the FINEST YELLOW JAPANESE in CULTIVATION.

GREAT SENSATION AND CHAMPION NEW KIND IN AMERICA.

And to prove it is so in the eyes of Englishmen one of our most successful trade exhibitors saw it exhibited in New York, and he was so sanguine of having the honour of sending it out, that it was publicly announced that they had the control of the entire stock for distribution in Europe, but our reputation secured us it instead.

ANNOUNCEMENT.

We beg to announce that we have completed arrangements with Messrs. H. CANNELL & Sons, Swanley, Kent, by which they will have the exclusive sale for England and the Continent of our grand new yellow Chrysanthemum, "GOLDEN WEDDING," for the year 1893. We have the entire stock of this variety, and will sell none to anyone else in England or on the Continent, hence the true stock can only be procured from the Messrs. Cannell, and all orders must be sent to them.

PETER HENDERSON & CO., New York, U.S.A.

The *American Garden* says:—Messrs. Peter Henderson & Co. swept off several of the best prizes with their mammoth "GOLDEN WEDDING."

THE "CUTTING CUP" (value \$50.00), for the best vase (any variety) containing fifty blooms of Chrysanthemums.

THE "GARDEN AND FOREST CUP" (value \$50.00), for the best six blooms of Chrysanthemums (any colour).

FIRST PREMIUM offered for the best vase of yellow by the New York Florist's Club.

THE FEATURE OF THE SHOW.

By winning the above, Golden Wedding became the feature of the Show, and was admitted to be not only the finest Yellow, but the best Chrysanthemum ever introduced in any colour.

2s. each.

H. CANNELL & SONS feel confident that this variety is a long way the finest and most brilliant exhibition yellow in cultivation. Photographs of Flowers and Silver Cups can be seen at our Offices.

OUR OTHER GRAND NEW KINDS:—

CLARK, Market Gardener, Goldstone, Brighton.

THOMAS GREEN & SON, LTD., LEEDS and LONDON,

HORTICULTURAL ENGINEERS to HER MAJESTY THE QUEEN, call Special Attention to their Patent Wrought-Iron Municipal or Angular Chambered and Tubular

HOT-WATER BOILERS,

And others with SHELVES, and HOLLOW or ORDINARY CAST-IRON GRATE BARS.

SADDLE BOILERS, With WATERWAY BACKS and WELDED BOILERS, any of which are specially adapted for Heating Greenhouses, Conservatories, Churches, Chapels, Schools, Public Buildings, Entrance Halls, Warehouses, Workshops, &c. They are the neatest, cheapest, most effective, and durable of any extant. The MUNICIPAL and TUBULAR ones are remarkable for their great heating power, slow combustion, and the length of time the fire will burn without requiring attention.

These Patterns secured the FIRST and HIGHEST PRIZE—a SILVER MEDAL—at the Royal Horticultural Society's Exhibition, South Kensington, London, June 1, 1881.

MUNICIPAL PATTERN BOILER, THE BEST EXTANT.

The longitudinal section gives a view of the fire-box, water space, flues, &c. The cross section gives a view of the fire-box, water space and V-shaped back. The front elevation shows it set in brickwork, which is necessary for this class of boiler.

TESTIMONIALS.

Re HEATING APPARATUS. Borough Engineer's Office, Municipal Buildings, Leeds. January 9, 1886. MESSRS. THOS. GREEN AND SON, LTD., NORTH STREET, LEEDS. GENTLEMEN,—I have great pleasure in bearing testimony to the efficiency and satisfactory working of the Hot-water Heating Apparatus you erected in these public buildings. The buildings are four stories high, and we have a total length of about 28,000 feet of piping in them, varying in size from 1½ in. to 6 in. diameter, with their connections, &c. The several offices and rooms can all be in operation at one time or separately, and the heat regulated by means of the valves to the temperature required, even in the coldest weather. Two of your Patent Municipal Pattern Boilers, No. 4, work the whole of this piping easily, although we have three of them fixed. They are very powerful and economical in the consumption of fuel, and I am pleased to be able to report of them and the apparatus so favourably. I am, Gentlemen, yours truly, THOS. HEWSON, Borough Engineer. Morley House, Bagot, St. Saviour's, Jersey, November 10th, 1886. GENTLEMEN,—The large Municipal Boiler which you sent me last year is doing its work satisfactorily; it is heating 5000 feet of 4-inch pipe in one of my vineries, and I am quite sure that it has power to work a much greater length, while in cost of fuel it can pay favourably with my other Boilers. I have now five of your Boilers in use, and I cannot speak too well of their heating powers, or their comparatively small consumption of fuel. MESSRS. THOS. GREEN AND SON, LTD., LEEDS. Yours faithfully, (Signed) G. W. BASHFORD. And HUNDREDS OF OTHER REFERENCES CAN BE GIVEN IF REQUIRED.

GLADIOLUS CHILDSI.

This New Giant Race of Gladioli, Hybridised and Raised by Max Leichtlin, is the Most Important Floral Novelty of this Generation.

THEY are much stronger and more vigorous than other Gladiolus, being very tall and erect, often standing 5 feet high, with spikes of bloom over 2 feet in length. They branch freely, in most cases each stem producing three or four spikes of bloom. The flowers are of great substance and of gigantic size, frequently 7 to 9 inches across. The form of both the flower and spike is perfection itself. But the most striking feature is their colouring. Orchids cannot surpass them in varied and delicate shades, markings, and blendings. Every colour known among Gladiolus is represented, and many never before seen, particularly blues, smoky-greys, and purple-blacks, all having beautifully mottled and spotted throats, made up of white, crimson, pink, yellow, &c., and in this particular network of charming spots and colours lies one of its special points of unsurpassed beauty.

PRICE of GLADIOLUS CHILDSI, mixed sorts, large flowering bulbs, delivered free by Sample Post to any part of the world, 2s. each, 3 for 4s., 12 for 12s.; 6 FINE NAMED SORTS for 20s.

We offer the following desirable Bulbs, carriage paid, at prices named:—

- 6 Gladiolus, beautiful American seedlings, all different 2s.
- 3 Gladiolus, Snow White, best and only pure white variety 3s.
- 6 Double Dwarf "Excelsior" Pearl Tuberoses, the best of all 2s.
- 6 New Variegated Tuberoses, fine bulbs 3s.
- 6 Zephyranthes, 6 different sorts, Yellow, White, Pink, &c. 2s.
- 6 Packets New American Flower Seeds, never before offered 2s.

SPECIAL OFFER. For 12s. we will send, carriage paid, to any part of the world, everything here offered, which includes one GLADIOLUS CHILDSI and CATALOGUE.
ORDER AT ONCE, AS THESE OFFERS MAY NOT APPEAR AGAIN.

OUR CATALOGUE for 1893 (a superb work of art in bronze-line), of Flower and Vegetable seeds, Bulbs, Plants, and Rare New Fruits is the most magnificent work of the kind ever issued. It contains 156 pages, hundreds of elegant engravings, stipple lithograph cover, and 7 beautiful large coloured plates. We offer the finest Novelties in Flower and Vegetable Seeds, Bulbs, Plants, &c., including the great Japanese Wineberry. This elegant Catalogue will be sent FREE with all orders, or on application.

For only 6d. we will send, post free, to any part of the world an Elegant Stipple Lithograph Painting of Gladiolus Childsi, in 18 colours, size 16 x 33 inches, showing in natural size and colours several spikes of bloom. It is the finest production in floral art ever produced.

Remember, that we send our Seeds, Bulbs, and Plants to every country in the world, and that we are the largest retailers of these articles in existence. Address—

JOHN LEWIS CHILDS,
FLORAL PARK, QUEEN'S COUNTY, N.Y., U.S.A.

Kew Gardens.—A large bed of Gladioli (Childsi) was seen in Kew Gardens last summer, and attracted much attention. At that time they were not named, but Mr. Watson, the Curator, writing to the American paper, *Garden and Forest*, stated "that the raisers might be congratulated on the excellence of their seedlings; that some of the spikes were fully 6 feet high, well furnished with flower larger than any other Gladiolus previously seen, and that the colours were brilliant as well as variable."

VICTOR POTATOS
(SHARPE'S).

This favourite first early Potato, suitable for any Garden, indispensable for Forcing and Early Borders, and likely to take the first rank amongst first earlies for market use. Quality and yield all that could be desired. One well-known market grower has this year had a yield of 15 tons per acre on a large acreage. London and Manchester salesmen speak highly of their quality, and report that Victors will keep their bloom and have a fresh appearance after being in the market some days, when other early Potatos have become discoloured and unsaleable.

The stock we offer is the true yellow-fleshed variety and not the white variety, which is often substituted.

Price per cwt. and ton. State requirements to

WITHOUT GOOD SEEDS AND VARIETY

YOU CANNOT HAVE GOOD GARDENS.

THE  IS THE MIND AND KNOWLEDGE.

This being so, it must be plain to all how much better **OUR OWN GROWN KENTISH GOLDEN SEEDS** are over those more northward, particularly those who have to purchase all they sell. Ours are new, large, and full of strength, maintaining the infant life until it has roots to feed itself, and thus produce stronger plants (the secret of enormous crops).

We further guarantee them all selected and re-selected by the cutest eye, and every year the most perfect models of everything are specially selected by an expert always on the spot for the following year's stock; from these we beg to offer Seed. It will thus be readily seen why all having their supply direct from us, their gardens are of a higher character and greater value over those otherwise obtained.

300 ACRES.

OUR NEW CATALOGUE, BEST EVER ISSUED, FREE TO COMING CUSTOMERS.

Other Testimonials similar to these.

Mr. FRANK WILKINSON, Causey Farm, Langfield, Tod-
morden, April 10, 1892.

The seed I had of you came up wonderfully strong, and
look splendid. I am glad I had Kentish seeds.

JAMES MOORE, Gillingham, June 6, 1892.

Your seeds have given me again great satisfaction, as they
have all (without exception) come up strong, far different to
some around here which were bought locally.

Mr. H. FARR, The Gardens, Ashfold, Handcross, Crawley,
Sussex, May 10, 1892.—I have always found your seeds
superior to all others, and they have given great satisfaction.

W. G. BEARD, Esq., Ovingdean, Masterton, Wellington,
New Zealand, April 28, 1892.

Your Asters were splendid, and the vegetable seeds also
exceeded my expectations. They carried me easy victories
in several shows about this neighbourhood. Well may you
call them "Golden!"

SATURDAY, DECEMBER 31, 1892.

DALMENY.

THE original spelling of Dalmeny was Dumanie, Gaelic for "black heath," since the changes that can be wrought by cultivation often entirely change the character of a district, it is quite possible that some of the higher grounds in the park might have justified the name. The house was built on a new site at the beginning of this century by the fourth Earl of Rosebery. The reason for this comparatively recent erection is that the old family castle, Barnbogle, is only a short distance off on the seashore. It is round Barnbogle that the history of the place centres. The first proprietors were the Norman family De Moubray. After being many generations in this family, it passed by marriage to the proprietor of the adjoining estate, Barnton. In 1662 the estate was bought by Sir Archibald Primrose, Justice General of Scotland. Sir Archibald had an adventurous life. He was taken prisoner at the battle of Philiphaugh, and, as he was well known as a staunch royalist, was only saved by the intervention of the Marquis of Argyle. Charles II. made him a baronet as "a special mark of royal favour to so faithful a servant." His great enemy was Lauderdale, and after the trial of Mitchell for the attempted murder of Archbishop Sharp, Burnet writes that "Primrose did most inhumanly triumph in this matter, and said it was the greatest glory of his life that the four greatest enemies he had should come and consign the damnation of their souls in his hand." He was twice married. His son by the first wife was the first Viscount Primrose, which title became extinct in 1741. There was only one son by the second wife, who at the revolution went up to London and pushed his way so well at Court, that he was made second Viscount and then Earl of Rosebery, the date of the latter creation being 1703. The present earl has already shed a lustre on the name. The Queen has twice been a guest at Dalmeny, and no doubt many affairs of state have been discussed in the library, when Mr. Gladstone and Mr. John Morley visited Edinburgh. The library is Lord Rosebery's sanctum; in it is Boehm's statue of Carlyle, and the ocean comes right up to its sea-wall, to remind him of the colonies he takes such deep interest in. The old castle itself was blown down in 1820, and was for a long time a ruin. It has been rebuilt in the old style, and is now one of the best examples of the old Scotch baronial architecture in the country, experts praising the massive stone corbels and the "crow-stepped" gables.

In two respects, Dalmeny can hardly be surpassed, i.e., the park, and the walk from

Cramond Brig to St. Margaret's Well along the shore. The distinguishing feature of the park is the irregularity of the surface. It would be difficult, if not impossible, to find any stretch of level ground in the 2000 acres which are enclosed. One or two of the elevations are 500 feet high; no two of the summits are alike. Eagle's Crag presents a sheer face of rock; the Kill, near the kitchen garden, looks like a ridge from one point of view, and like a broad-base half-cone from the old road to Barnbogle Castle; the mansion hill is rounded at the top; and Glenpuntie is a gentle upland. Moushill also disdains to look like the others; and a high ridge of black trees seems to reach to the Pentland's billowy crests. The declivities are equally variable as the ascents; the grandest are the wide, shallow valleys of woodland. Most of the hills are planted, and a wide strip of wood goes all round the park inside the wall. The under-cover is wonderfully luxuriant; the Rhododendrons form large clumps, and grow quite tall; and the Privet in places covers many acres. In the wood by the side of the drive from the Edinburgh road, it is like a green carpet, completely obscuring the ground. To reach this result, Mr. Allan, the forester, plants the Privet very thick, and when it gets about 2 feet high, has it switched every year with a hook. Snowberry, and the crimson Dogwood are also much in evidence; and where the station road runs along the park, Ivy covers the ground for a long distance. Young plantations will in time add an additional attraction; the most extensive is a plantation of the hardiest and quickest-growing Pines, such as the Corsican, Weymouth, Scotch and Black Austrian, called the Chapel Coppice. Where the drive winds round it, choice Conifers have been planted. Last, but not least, the park is thickly timbered, and contains many ancient trees, and an avenue of old Oaks, many of which girth 17 feet.

"The Oakea for shade, the hills for breathing space,
The trembling groves."

A good place to start our inspection is where the drive passes above the kitchen garden. Scotch kitchen gardens are usually placed, if possible, in beautiful surroundings. Dalmeny is no exception. High trees with frequent Scotch Firs crown the hill at the back; to the left are high trees, and at the foot of the slope are a belt of Spruce and other Conifers. A little further on is a shelving lawn of Conifers about 20 feet high, evidently enjoying life, if their bright green colour is any criterion, through which a path lined with thick *Cupressus Lawsoniana* on one side, and *Thuja gigantea* on the other, descends to the kitchen garden, passing on the way a bank of Rhododendrons and an oval pond. A pretty approach was the verdict soon given. The garden has the advantage of a southerly slope, and also of two different sub-soils, clay and sand. The walls are 20 feet high, so that the fruit trees are allowed to run full length. One long border, 40 feet wide, contained only James Veitch Strawberry.

In front of the vinerias was a well-filled herbaceous border, Carnations forming the front line, and Rose borders lined the centre walk. Cordon Plums and Apples, which are not grown in Scotland to any extent as yet, were placed on an eastern aspect. The soil evidently suits Celery, the sticks being very thick and tall. Col. Clarke's Red and Dickson's Matchless White are the sorts grown. The Michaelmas Daisies were still in flower, and a long border of hardy Auriculas will be very bright in the spring. The

border under the north wall is planted with young ornamental shrubs, such as *Aetinosporas*, *Biotas*, and the different varieties of *Cupressus Lawsoniana*. A north wall outside the garden is devoted to Currants; three branches from each tree are trained up cordon fashion. From this wall Currants have been gathered in November. Globe Artichokes also are largely grown. The walk round the outside of the kitchen garden is very interesting, as it is used as a nursery, from which the estate is supplied. On the west side

FIG. 128.—MAMMOTH TEN-WEEK STOCK.
(SEE P. 791.)

is a dense Holly-hedge, under which are young Firs and Pines. A line of specimen Conifers, with a thick belt of Rhododendrons behind, takes the place of the Holly-hedge on the south side. Here are seedling, yearling, two to three year old Larch, Scotch and English Oak. On the east side there is a break of Spruce and Dogwood.

The kitchen garden is some little distance from the precincts, the path thither leads through a hollow between two sloping lawns. Conifers, Golden and Silver Queen Hollies, and frequent masses of Rhododendrons contrast with the nut-brown park upon which the shaggy soft-eyed high-

land cattle graze and look up in mild enquiry. At the head is a triangle of Privet and Laurel, which causes a forking of the paths, the left leading to the north side and the right to the west. Taking the latter, further progress is soon barred by a wall. Entering by a gate, the first thing that caught the eye were some splendid specimen Golden Queen Hollies, growing on a small lawn. They were five in number, grazing the ground, all over 30 feet high; the largest was 24 feet in circuit of branches. The gold tints predominated so much over the green, that they looked like cones of gold. A fine Silver Queen, and an Irish Yew spreading out its branches, also attracted attention. Query—why are not Irish Yews growing in this way top-heavy? A double line of young Golden *Retinosporas* and *Cupressus Lawsoniana erecta viridis* was planted all round in front of the border of shrubs that kept out of sight the wall. When any of them get too tall, they are planted elsewhere, and replaced by others. No two more different Conifers, probably, either in habit or colour, could be put in juxtaposition. A wide stretch of park comes right up to the house on the south side, but on the east only a very narrow strip intervenes between it and the "much-resounding" sea. The sea came in sight so suddenly round the corner of the house, that the inclination was strong to cry, *Θαλασσα, Θαλασσα*, like Xenophon's Greek soldiers. The coast as seen from the terrace is flat, with Cramond Island, a conspicuous object, to the right. There is nothing notable on the north side, except the nearness of Barnbogle Castle, and a road to it, which we will take.

The flat coast comes to an end at the castle, and on the other side suddenly rises into a high wooded ridge skirting the line of the coast for two miles. Mr. Gladstone and Mr. John Morley both expressed the opinion that they never saw such heavy timber near the sea before. By walking along this ridge, a succession of views of great variety and extent can be obtained. Due east the restless motley sea disappears in a faint delicate line of distant haze. The time has now come to take the lovely walk along the coast mentioned at the beginning of this paper. The changes of scene are so constant, that I can only hope to give a few of the incidents. At the start, high trees come down almost to the edge of the sea wall. Where the old drive from Barnbogle formerly descended, the ridge is not so high, and the slope is gentler; therefore the wood retreats to a greater distance, and appears to form a woodland valley. The effect was very picturesque and grand. Proceeding, Eagle's Crag overtops the ridge, but is lost to view when the path enters a Beech grove. From a group of Scotch Firs, bare of branches on the sea side, the "dim-discovered" towers of Donibristle could be seen over a cloud-darkened sea. Here the handsomest man of his time—"the bonny Earl of Moray" of the song—was murdered by Gordon of Cluny, as he was trying to escape. His good looks were the cause of his death. For James VI., jealous of the "braw gallant," who was "a queen's love," sent the Earl of Huntly to Donibristle, with orders to bring him to Edinburgh for trial on a trumped-up charge. Now there was a deadly feud between the two Earls, and a chance shot having killed one of the Gordons, Huntly ordered the castle to be set fire to. His wife happened to be at Castle Doune, another property of the handsome Earl—

"Oh! lang will his lady
Look ower the Castle Doune,
'Ere she see the Earl of Moray
Come aounding through the town."

The seventh or eighth Earl is said to have planted

13,000,000 trees on his three estates. For about a quarter of a mile from this position is an undergrowth of Rhododendrons, ending in a high brown ridge of withered bracken; in spring, I was told with a smile, Primroses took the place of the Ferns. Going through a miniature wood of Larch, Scotch and Silver Fir, we come to Hound Point, where there are also some spray-damaged Firs. The whole estuary of the Forth is open to view from this headland; I scarcely glanced at it, however, for the Forth Bridge could be seen from start to finish. St. Margaret's Well is a little further on. We did not, however, go there, but made a way for ourselves up a woody glade by the side of a rivulet. Enormous Lastreas were growing by its side; one frond I cut at random, and measured, was 42 inches—its weight made it form an ellipse, and gave it a great resemblance to a Tree Fern frond. This ferny path brought us to the park again. No description would be complete without an account of the walk across the centre of the park. Castle Craig, a Fir-clad eminence, and the Garden Hill, so steep that the path to the top needs to be serpentine, are first passed before coming to the lake, situated in low ground, with hills all round, Rhododendrons being planted here and on the island. The lake, however, is not the end of our walk. Three important features of the estate have to be encountered ere that is accomplished, namely, the mansion hill, the home farm, and Glenpuntie. The summit of the hill affords a good view of the mansion and of the east side of the park, one side of which is bounded by the blue glimmer of the sea. The trees here seem to run in lines, consequently more of the old pasture land is seen. At Glenpuntie a new nursery was being formed. The grass land was being ploughed up; the long, straight, unerring furrows showed that the Scotch farm labourer is as skilled in the art of ploughing as his English confrère. Some very good "stuff" ought to be grown here, as the situation is exposed, and it is virgin soil. The approach from the Edinburgh Road passes close by; on one side is a wood, on the other cultivated fields. The Lothian farmers pay £5 to £6, or even more, for their land, and yet manage to pay their way with a surplus over. About a mile along the Edinburgh Road is the Cramond Brig Hotel, where I waited for the Forth Bridge four-in-hand, watching the while the flooded Almond in its desperate hurry to squeeze through the bridge. *Vagabond,*

cactus myriostigma and Mamillaria fissurata, for the photographs of which we are indebted to Mr. J. Skelton, gr. to Jas. Lingford, Esq., Mount Pleasant, Bishop Auckland.

Echinocactus myriostigma is remarkable for its deeply-lobed stem, thickly studded with white dots (whence the name), but destitute or nearly so of

FIG. 129.—ECHINOCACTUS MYRIOSTIGMA. REDUCED ONE-HALF: FLOWERS, STRAW-COLOURED.

spines. The white dots or "stigmata" are with a magnifying-glass seen to be masses of felted white hairs. The flowers measure about 1½ inches across, are straw-coloured, the individual petals being tipped with black. It is a native of Mexico, and requires a warm greenhouse to flower it, though it will grow in any structure from which frost can be excluded.

FIG. 130.—MAMILLARIA FISSURATA: FLOWERS, ROSE-COLOURED.

Mamillaria fissurata is unlike most of its congeners, the stem being divided into numerous closely-set triangular rugged lobes, and bearing, at the top, flowers 1½ inch wide and rose coloured. Mr. Skelton tells us the flowers remain in bloom for about ten days. It is a native of Mexico, and rare in cultivation. Exposure to full light, good drainage, water in

the growing season (summer) and almost complete drought for the rest of the year, together with cleanliness, are the essential points in Cactus culture.

RHODODENDRONS.*

(Concluded from p. 732.)

GHEENT AZALEAS.

The history of the hardy Azalea in English gardens dates back to 1738, when Peter Collinson, the friend of Linnæus, introduced *A. nudiflora*, *A. viscosa*, and *A. calendulacea* from North America. The source of yellow in these was *A. pontica*, introduced in 1793. According to London, Messrs. Lee & Kennedy were the first to produce hybrids in this country. Then followed the Osbornes of Fulham, and the Waterers. Loddiges enumerated one hundred and seven kinds in his catalogue, nearly seventy years ago. They were chiefly the result of intercrossing the American species with *A. pontica*. A baker in Ghent, named Mortier, also raised many hybrids and seedlings from these. His work was taken up vigorously by the Ghent nurserymen, including Van Casel and Verschaffelt. Their plants soon became prime favourites in England, where they received the name of Ghent Azaleas. Van Houtte first succeeded in raising double-flowered kinds. These plants are now grown in enormous quantities in Ghent, for the supply of the English and other markets. They are raised from seeds, the one-year old seedlings being used as stocks for choice kinds which are grafted as Camellias are. They make saleable plants in two years after grafting. A race of late-flowering varieties has been raised by Mr. A. Waterer, by breeding from *A. occidentalis*, which flowers a month or so later than the ordinary kinds.

A. sinensis (mollis) is also very largely grown in Belgium. Van Houtte did much to improve it in the substance and colour of its flowers. It is of special value for forcing, besides being a first-rate flowering shrub for the open air. Mr. A. Waterer has some very fine varieties with flowers deep red in colour. This species and its forms have a great value for out-door gardening, which has not yet been recognised. They are quite hardy, and flower very freely outside.

NEW OR NOTEWORTHY PLANTS.

COSTUS ENGLERIANUS (SYN. UNIFOLIUS).

SINCE my description of this plant appeared in print, I have discovered that it is the same as *Costus Englerianus*, Schumann (*Engler, Bot. Jahrb.*, vol. xv. p. 419, t. 13), which was published in August of this year, and therefore takes precedence of my name by four months.

But the plant is still a new one, so far as horticulture or even science is concerned, only the name *C. unifolius* must give place to that of *C. Englerianus*, *N. E. Brown*.

SUCCULENTS.

SOME day the weathercock of fashion, at least, among hobby-riders, will point to Succulents. When we consider their relatively easy culture, their quaintness and varied interest, and in some cases, the surpassing beauty of their flowers, it seems strange that they should be so neglected, especially by those whose means and space are limited. The two plants we figure in our present issue are Echino-

Rhododendrons cultivated in the open air at Kew.

ARTIFICIAL MANURES FOR FRUIT CULTURE.

THE subject of fruit-growing for profit is one that has during the last few years been attracting increasing attention, partly owing to the hope that it may prove a means of bettering the condition of the cultivator of land, and partly to the growing demand for fruit as an article of food. Evidence of the growing importance of fruit farming is supplied by the activity which may be observed in the manufacture of chemical manure. It appears that today the balance of opinion is against the total replacement of natural by artificial manure, but many high authorities agree that a large proportion may be so substituted with advantage to the crop, and with economy to the cultivator. We are interested in observing that chemists of good standing are recognising the fact that, with profit to themselves and advantage to horticultural industry, they may devote serious attention to the chemical aspect of cultivation. It is significant that Mr. H. Brunner, the President of the Liverpool section of the Society of Chemical Industry, chose for his chairman's address the other evening the subject of artificial manures for fruit culture. And we congratulate the society on an occasion like this, that they can turn aside from the discussion of matters which, perhaps, are only interesting to the scientist strictly so-called, to the consideration of a subject which is really of national importance.

Mr. Brunner, in the course of his long address, referred to his own experiments made on the cultivation of Strawberries. He stated that, by employing chemical manures, far less potash, phosphoric acid, and nitrogen is required per acre than is the case with ordinary farmyard or stable manures, as, owing to their soluble form, they penetrate the soil more rapidly and deeply.

With regard to the requirements of 1 acre of land planted with Apple trees, it was stated that 20 tons of farmyard manure would be necessary once in three years, whilst the necessary ingredients contained therein would be supplied by the yearly use of 500 lb. of kainit (containing 13½ per cent. of potash), 120 lb. of superphosphate (containing 16 per cent. of soluble phosphoric oxide), and 360 lb. of nitrate of soda, or a total for the three years of 26 cwt. of material. From these data it is evident that in certainty of effect, in convenience of handling, and in distribution over the soil, chemical manures possess distinct advantages.

It must not be supposed, however, that Mr. Brunner is entirely biassed towards manuring by strictly chemical means and methods; he does not recommend the complete discarding of farmyard manure, but rather the adoption of some system of rotation of manures, such as that advocated by Wagner of Darmstadt for the cultivation of Vines, in which farmyard manure is supplied in the first year, and supplemented by chemical manure only in the second, third, and fourth years.

It has been urged against chemical manures that

they render the soil poorer in organic matter, whilst farmyard manure has the reverse effect, but it has been shown by Joulie (*Mercurie Scientifique, Supplément du Moniteur Scientifique*, June, 1892), that the more abundant harvests produced by the use of chemical manures have a larger proportion of residues in roots and otherwise in the soil, and consequently that there is no impoverishment, but an increase in the quantity of organic matter.

By the use of chemical manures each ingredient can be adjusted to the requirements of the crops, which is obviously not the case with natural manures; whilst Ville has shown (*Ville on Artificial Manures*, translated by W. Crookes, p. 105) that more than one-third of the nitrogen contained in the latter is lost to the soil on account of the decomposition which the manure must first undergo before it can exercise any beneficial action. The cost of carriage and of distribution on the land is also favourable to the employment of chemical manures.

Superphosphate is the most suitable form of phosphoric acid for the fruit-grower, and it further has the important advantage of supplying a considerable quantity of a soluble lime-salt necessary for the building-up of healthy trees. Finely-ground basic-slag is also likely to prove of great value, since it contains 18 per cent. of phosphoric acid combined with lime in a fairly soluble form. The latter should be applied in larger proportionate quantity than the former, and will be found especially useful in preparing the ground before planting young fruit trees. Kainit affords the cheapest form of easily-soluble potash, but it only contains about 13 per cent. of potash, and as much as 40 per cent. of sodium chloride (common salt). Nitrate of soda is the best and most economical nitrogen manure for fruit cultivation; sulphate of ammonia is less suitable. G.

SCOTLAND.

ABERDEEN HORTICULTURAL SOCIETY.

THE monthly meeting of the North of Scotland Horticultural and Arboricultural Society was held on the 21st inst., in the Christian Institute—Mr. C. S. France presiding. Mr. Tough, Nigg, read a paper on the "Formation of Soils," describing at length the chemical, mechanical, and atmospheric agencies that were at work making the soil capable of nourishing plants, and concluded with a demonstration of the important work done by the common earthworm. Mr. G. Ross, Cranford, opened a discussion on the "Theory and practice of Root-pruning."

THE WEEK'S WORK.

THE ORCHID HOUSES.

By H. A. BURBERRY, *Orchid Grower, Highbury, Birmingham.*

DURING severe weather, such as we are now having, firing becomes a most important operation, and must command careful attention, for the general health of the plants in such weather depends largely on the manner in which it is done. Artificial heat should never be present in excess of what is really required, and, on the other hand, sufficient means should be available that will suffice to keep the house at the required temperature, and sufficient moisture and air should be ensured to keep the atmosphere nicely balanced, and of a growing nature. The more perfectly this is managed, the more successful will be the results.

THE COOL-HOUSE.—It sometimes happens that the surface of the compost in which *Odontoglossums* are growing becomes sour, and displeasing to the eye. If in this state it is difficult when watering to satisfy oneself whether the plants require water or the reverse, and to examine each plant closely would occupy too much time; therefore, much good work can be done by procuring some fresh sphagnum moss and fibrous peat (the former for this work may be used alone), with which the whole of the plants may be top-dressed. It must be done carefully, because by this time many new roots will be on or near the surface of the compost, and the new material

should not be pressed down with sufficient force to break or otherwise injure these new roots. After top-dressing it is best to gently water with a rose-can, after which there will be no difficulty in ascertaining at sight whether water is or is not needed. By going through the plants in this manner, a splendid opportunity presents itself to thoroughly clean them, and to dip them in an insecticide to more effectually destroy thrips and aphides. Many varieties of this genus, such as *O. odoratum*, *O. gloriosum*, *O. Andersonianum*, *O. Coradinei*, *O. triumphans*, and *O. blandum* are now pushing up flower-spikes, which may be allowed to remain if the pseudobulb is sufficiently strong to carry a good spike of flowers without much exhaustion, but if not, the spike should be pinched off. The next few months will then give a good chance for the plant to recover its vigour, without which good spikes of bloom cannot be obtained. The temperature for this house may fall during severe weather as low as 45°, but it is best if generally kept from 50° to 55°, on no occasion letting the atmosphere become dry or in any way unsuitable to the free growth of the plants. In a former calendar I advised a covering for the houses during severe weather, this may now be advantageously applied.

DRIP.—This is sometimes a great nuisance, especially in badly-constructed houses; it happens when ice forms on the glass inside the house during the night, and as the temperature rises the ice thaws, and the water drips on to the plants underneath, oftentimes wetting them if unobserved to saturation point.

THE FLOWER GARDEN.

By H. W. WARD, *Gardener, Longford Castle, Salisbury.*

NEXT YEAR'S PLANTING OF THE FLOWER BEDS, ETC.—In order that the plants with which the beds will be filled be propagated in sufficient numbers, a list should now be prepared, if not previously done, of all the various things needed, to which ought to be added the height, colours of leaf and flower, for easy reference at planting time. The list of plants that will be required for subtropical and carpet beds should not be omitted. Go over the *Pelargoniums* grown for bedding-out, and forthwith cut off all of the best cuttings to be found for propagating purposes. In order to economise space, put them in at about 2 inches apart in wooden boxes made 30 inches long, 9 inches wide, and 4 inches deep, and provided with seven or eight ¾-inch holes in the bottom. The boxes should be filled with light soil overlying crocks and siftings, and having a surfacing of sand. After watering them with a fine rose-can, place close together in a forcing-house. Cuttings of *Ageratum*, *Heliotrope*, and *Lobelia* may be struck in a similar manner.

FUCHSIAS.—Some few old plants of *Fuchsias* may now be put into heat to furnish cuttings, first trimming the plants into shape, pricking up the crust of soil, and affording water at the roots. If these plants are lightly syringed with tepid water, they will soon push into growth, and as soon as the shoots have two joints, they may be made into cuttings and put into boxes or pans in the manner recommended for *Pelargoniums*.

REMOVING MOSS FROM TREES.—Mossy trees are disliked by some persons, but it is not hurtful when not in excess, although it indicates moist land and atmosphere, and sometimes the need for draining. It can be scraped off with a bit of lath or hoop-iron from the stem and limbs, but the smaller branches should be dusted over whilst damp with a mixture of fresh soot and powdered lime.

STAKING TREES.—All young trees which are likely to grow out of the perpendicular should be securely fastened to a stout stake driven 18 inches into the ground, on the side where it will be least observed. Trees in exposed places will require three stakes put in about 1 foot from the stem, and equidistant, the tree being secured with neat straw-bands to each. Heavy-headed trees sometimes require to be guyed with stout wire as well as staked, to overcome the danger of wind-rocking. Sweeping lawn and walks, and rolling the latter after rain will be nearly all the operations that need attention for the present.

PLANTS UNDER GLASS.

By R. MILNER, *Gardener, Penrice Castle, Swansea.*

THE WATERING OF STOVE PLANTS.—It is at this season of the year that the watering of the different subjects occupying these structures requires

most care, and also in placing them in the different positions which are found most suitable for them. The Crotons, for instance, should not be allowed to suffer for want of water at the roots, especially when the pots are well filled with roots, as should they suffer in this respect to any great extent, they are liable to cast their foliage. Palms also should not be allowed to suffer from dryness, or injury will be done, which will not be detected until some time afterwards; and it will also be the means of encouraging different kinds of insect pests. So long as the drainage is in a satisfactory condition, there is little danger of these plants suffering from an over-supply, especially when the roots are somewhat pot-bound. Dracænas should be kept moderately moist, and must never be allowed to become over-dry. Strict attention should be paid to keeping the leaves perfectly free from all insect pests by frequently sponging. The Marantas are moisture-loving subjects, and should always be watered freely, even at this season, or they will quickly feel the effects; and, like the Dracænas, their leaves also should be sponged frequently, as thrips are very partial to these plants. Anthuriums will require to be watered with care, as during the present time they will be at rest, which necessitates their being kept rather dry, or the roots are liable to decay; and these same remarks will also apply to the Alocasias, Allamandas, and similar subjects, which are deciduous, and will require but little water during the time they are dormant. Advantage should be taken to have this class of plants thoroughly cleansed, as this work may be done more effectually at this season than when they are in full growth. Young stock of Aralias, Dracænas, Pandanus, Crotons, Asparagus plumosus nanus, Palms, *Isolepis gracilis*, Tradescantias, Fittonias, &c., which have been grown-on specially for providing material for furnishing, should be kept in as healthy a condition as possible.

FRUITS UNDER GLASS.

By J. RIDDELL, Gardener, Castle Howard, York.

TOMATOS which have been grown either from cuttings or seed, propagated or sown at the beginning of last September, may now be repotted or planted out. Where there are facilities for adopting the latter method, I strongly recommend the necessary means being taken to put it into practice. Not only are the best results obtained from plants which have a fairly wide range of rooting space, but when the soil in which their roots are allowed to ramble is maintained at a temperature of 70° by means of a hot bed, the health of the plants and the yield of fruit is in proportion to the extra labour bestowed upon them in this direction. The compost for either pots or borders should not be too rich in organic matter, and for this reason farmyard manure or bulky vegetable substances are best entirely left out, and only used for surfacing on the apparent exhaustion of the soil. Wood-ash, kainit, super-phosphate mixed with bone-flour, and lime, in a mild form, may, however, be incorporated with the loam. Later in the season, sulphate of ammonia can be sparingly applied, if a nitrogenous manure be required to stimulate growth of leaf. Make the compost moderately firm about the roots, and moisten the soil with water 10° higher in temperature than the atmosphere of the house. A minimum temperature of 60° should be maintained, and the air of the house kept dry and moving; employ artificial means to secure fertilisation; stop all side-growth close to the stem, and admit air on all favourable occasions. A few seeds may now be sown to supply plants for later use.

MELONS AND CUCUMBERS.—Seeds of these may be sown under a hand-light or bell-glass, in a temperature of 80°. Three seeds in a 3-inch pot (of each of the earliest varieties) will be found the most convenient way of raising a stock of plants at this season, pulling out the weakest when it is seen which are the most promising.

STRAWBERRIES.—Get hot-beds ready for Strawberry forcing and other purposes, and once they are in place take in the first batch and plunge them to the rims of their pots. A selection of the best ripened crowns should be made for the earlier lots, allowing those less matured to stand over till the last. Afford a bottom-heat of from 70° to 80°, and a night temperature of 50° for 10 days, then raise by degrees to 60°; water according to the needs of the plants, occasionally sprinkling the surface of the bed with water through the syringe, but do not maintain a humid atmosphere, or the prospects of a good crop will be spoiled.

POT VINES.—Gradually raise the temperature at the rate of about 2° a week after these have nicely started, and cease syringing the canes. The moisture in the structure, after this stage is reached, will have to be regulated by the weather, but at no time during the first months of the year should an excessive moist air be maintained.

FIGS.—Pot plants may now be taken into heat, giving them 45° to 50° (minimum temperature) to start. Plunge the pots in a bottom-heat of 65° to 70°, if the means are at command for doing so, and well bedew the plants three times daily. Do not be too liberal in the supply of water to the roots until the leaves are developed on the plants. Avoid extremes of temperature, and cold currents of air playing upon the plants during the earlier stages of the fruits' development, lest they receive a check which would ultimately lead to failure.

THE KITCHEN GARDEN.

By G. WYTHES, Gardener, Syon House, Brentford.

FORCING.—There will be no lack of materials for forcing if my directions have been duly carried out. With regard to fermenting materials, which are now of great use, leaves should be heaped on a bit of spare ground away from the kitchen garden, where the necessary turning over and mixing with stable litter may be carried out without creating a nuisance, and here the stable litter may be mixed together, watered if dry, and thus be got ready for use, either in conjunction with leaves or alone. The present is a good time to prepare beds for crops which come in quickly, and for which a long-enduring heat is not essential. For these the bed may consist wholly of tree leaves, or leaves and dung, and it need not be made more than 2 feet deep.

RADISHES may be raised readily on a bed of warm leaves, and although the seed is often sown with other crops, they are not always profitable in that way, coming up quickly, and requiring freer ventilation than ought to be afforded the other slower-growing plants. Separate sowings are usually the more useful. The small-topped Early Rose and the French Breakfast Radishes are good for early sowings. It is important that the bed and soil should be nicely warm before the seed is sown, and by making up beds at this date they will be in proper condition a fortnight hence.

CARROTS may be treated like Radishes, but a greater depth of fermenting material should be employed, as the bed will be required to last much longer, therefore, use leaves liberally. After sowing the seed, keep the lights close, merely affording air to let out the excess of moisture arising from fermentation. Sow very thinly in rows on the surface on a bed of good loam at least 8 inches thick and make the latter level and firm before sowing. The varieties Early Nantes and French Forcing are very useful for the earliest sowings.

TURNIPS require to be similarly treated to Carrots, with the exception that more air is required by the plants as soon as they are furnished with three or four leaves. The soil should be near the glass, to prevent drawing of the leaf-stalks. The Extra Early Milan is a very early variety, that soon attains a usable size.

POTATOS.—Preparations may now be made for forcing these tubers in frames. More soil is necessary for a Potato-bed than for Carrots, &c., but all the soil is not wanted at one time, but it should be added at one or two operations, when the stems require to be moulded-up. For this latter purpose the soil from a disused Melon or Cucumber-bed may advantageously be used. A Potato-hotbed may be of litter and tree-leaves thoroughly incorporated together, afterwards well trodden, and the soil which is put on the beds should be quite warm before the sets are planted, otherwise a check to growth will ensue. The sets may be prepared by planting them in boxes or pots with a little light compost under and over them, they will then come up with a lot of roots, which readily seize on the new soil on being planted.

FRENCH BEANS may be sown in pots for fruiting or planting out, if for the former 6, 7, or 8-inch pots should be employed, the smaller size often giving a good return early in the season. For later supplies of Beans, larger pots are better. When planted out on a hot bed, small pots are best for

sowing in, and are to be preferred to boxes, because of the less disturbance of the roots. Water must be sparingly applied to the soil when planted out, indeed a moist soil will scarcely require any before the Beans are well up, and care should also be taken to use a warmed soil, and to place the pots when sown close to the glass in a house having a night warmth of 60° to 62°. Sow six seeds in a pot, but leave only four plants after it can be seen which are the best. Siou House and Ne Plus Ultra are good varieties for forcing early in the winter; and Canadian Wonder (Red Flageolet) later. Make use of a good rich loam that is not of too heavy a nature, and to this add spent Mushroom-bed dung. Afford the pots in which the plants are to fruit plenty of drainage, and only half-fill them when planted or sown. Keep regular supplies of Seakale and Asparagus by putting in batches of roots at intervals of a fortnight.

MUSHROOMS.—Every month at least a new bed should be made. Be careful to avoid a higher air temperature than 58° or 90° in the beds, and excessive moisture in the Mushroom-house. Beds which are past their best may be induced to push up a further supply of Mushrooms by watering them with tepid water in which salt at the rate of a tablespoonful to 3 gallons of water is dissolved.

THE HARDY FRUIT GARDEN.

By H. MARKHAM, Gardener, Mereworth Castle, Maidstone.

THE APRICOT.—The trees may now be pruned, when not in a frozen state, dressed with an insecticide, and put in order. Their training is usually that known as the fan, a style in which the branches radiate from the upper part of a stem about 18 inches high. As much young wood must be laid in as can conveniently be done without crowding, many vacant spots being caused by the dying out of shoots and branches. Shoots of medium-size, if well-ripened, should not be shortened further than to cut off the green tips. Superfluous laterals may be cut back to two or three buds; also the forerights to one or two buds. When trees have become covered with long snags owing to neglected pruning, some of these should be cut away annually till all have been removed, when the trees will bristle anew with strong fruit-buds close to the old wood; and such buds being sheltered by the leaves, are not so liable to be injured by frost as those on long spurs. Aged trees should have top-dressing afforded them annually, first carefully removing some of the upper soil, so as not to injure the roots. As a dressing, use good loam and old mortar and wood-ashes, mixed intimately together, trampling it firmly, and before the soil is put on, a dressing of bone-meal strewn over this will greatly assist the trees; finally, mulch with stable-dung or other manure, if the borders are well-drained or much raised above the general level, or the soil light; but if it be cold and heavy, mulching may be left till the spring. Young trees early planted may likewise be pruned and nailed, but the soil over and about the roots should first be thoroughly trodden, whereas late-planted trees will be best left till the spring. If the young wood is not very strong, and there are from five to seven shoots on a tree, no pruning will be required, excepting perhaps removal of weak laterals. Be particularly careful not to injure the bark with nails, and to pull the shoots into position with broad shreds or ties.

YOUNG STANDARD APPLE TREES.—These trees should be carefully pruned at first, and until the main branches have been properly selected and fixed in place. These main branches should number from three to five, and be trained outwards as they lengthen. As other branches are put forth, these must be similarly treated until the framework of the crown is formed. These main shoots must be shortened to about 20 inches, cutting to an outwards inclining bud. Apples, Plums, Damsons, &c., should be treated alike in this period of formation. In pruning Apples, mark the peculiarity of those which fruit at the tips of the shoots, as does that excellent Apple the Cornish Gillyflower. Grafts may now be obtained and laid-in in the shade.

FIGS.—Severe frost, where trees were not protected, may have killed many of the young fruits; and in any case, in view of a continued low temperature, the trees should be afforded protection, which may be in the form of straw mats, straight-pulled straw, Rush mats, or a thickish covering of Spruce Fir branches, and the ground over the roots should receive a thick covering of dry litter.

EDITORIAL NOTICES.

LETTERS FOR PUBLICATION.—All communications intended for publication, as well as specimens and plants for naming, should be addressed to the Editor, 41, Wellington Street, Covent Garden, London. Communications should be WRITTEN ON ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

ILLUSTRATIONS.—Photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c., are particularly solicited.

Advertisements should be sent to the PUBLISHER.

APPOINTMENTS FOR THE ENSUING WEEK.

SALES.

MONDAY,	JAN. 2	Plants and Dutch Bulbs at Protheroe & Morris' Rooms.
WEDNESDAY,	JAN. 4	Lilium auratum and other Lilies at Protheroe & Morris' Rooms. Roses and Shrubs at Stevens' Rooms.
THURSDAY,	JAN. 5	Plants and Dutch Bulbs, at Protheroe & Morris' Rooms.
FRIDAY,	JAN. 6	Orchids, at Protheroe & Morris' Rooms.
SATURDAY,	JAN. 7	Plants, Bulbs, including Lilies, at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—35°·5.

WE are accustomed to speak loosely of the past, as if it had merely historical importance for us, and to regard the future as something too problematic to divert our attention from the duties and exigencies of the present. No one knows better than the gardener how unphilosophical this superficial way of dealing with things is. No one realises more fully than he that his success or his failure in the present and in the future are inextricably interwoven with what has gone before. Past, present, and future are only relative expressions, and convenient terms for use; but he must be something more than mortal who could say where the influence of the one ends and that of the other begins.

Looking back to the events of the past year, and to those immediately preceding, we fancy we see the germs which will in the future develop into an altered and improved condition both of gardeners and gardening. The demand for technical education which has almost suddenly sprung up, the more sympathetic feeling that has arisen among many practical men for what they erroneously call "theory;" the realisation of the fact that if substantial progress is to be made, and not mere routine repetition persisted in, and if we are to be found equal to new and varied conditions as they arise, we must take care that our foundations are laid according to scientific principles;—these indications are of the best augury for progressive horticulture. And among the gardeners themselves we see traces of a desire not only to better themselves by all legitimate means, but to promote at the same time the interests of their common profession. A higher ideal is gradually evolving, and the winning a prize at a flower show, however legitimate it may be, will cease to be regarded as the only or the chief satisfaction of the ambitious gardener. Schemes of co-operation and conjoint action on the part of the gardeners are "in the air," as the phrase goes. Much depends, everything depends, on the form that these take. Some people dread the development of what they call "Trades-unions," but is it not because they have

in mind unions which are wrong in their first principles, and so fore-doomed to failure—unfortunately, perhaps, not before they have wrought much mischief? Is it not because some trades-unions set purely selfish aims in the fore-front? These, too, have to learn by bitter experience that it is idle to kick against the pricks of natural laws, and that the temporary advantage of a few is no compensation for the misery of the many. But a co-operation which shall bind gardeners together to work for a common end—the welfare and progress of horticulture—will have an elevating influence on the profession, and advance the interests of the individual in the most legitimate manner. This is too big a subject to discuss when the events of the whole year are supposed to be under review. But we could not avoid alluding to it, because it is among "the signs of the times," and because already the bogey of "trades-unionism" is beginning to be held up *in terrorem*, and this should be encountered at once.

Much of our space has been taken up with the record of the doings of the County Councils in regard to technical education. It is immensely satisfactory to find that so few mistakes have been made, and that such a measure of success has been already attained. Considering how new the whole thing is, and how suddenly it was sprung upon us, the results must be considered satisfactory and the prospects hopeful.

We must take care to keep in mind the essential differences between practical demonstrations to adults such as have hitherto formed the staple of County Council work, and instruction in elementary principles such as we hope to see given to the young gardeners, and such as is already given at Kew and at the Edinburgh Botanic Garden.

We have so lately alluded to these details that we may now pass them with the mere mention. But we cannot help again reminding our readers how extremely limited are our schemes in comparison with the all-embracing comprehensiveness of the work begun at the new Californian University, and which was explained in detail in our columns by Prof. EMORY SMITH.

The examination scheme revived by the Royal Horticultural Society last year worked satisfactorily so far as it went, and it will do good by indicating to lecturers and pupils the subjects to which their attention ought to be directed. No one supposes that a good gardener is to be made by listening to a lecture, reading a book, or passing an examination. Practical experience is of course essential, but that experience can be more quickly and thoroughly obtained by the aid of the means we have mentioned, and when obtained can be turned to better account and becomes infinitely more fruitful than any amount of practice by itself. Another result of the education and examination schemes will be that the *esprit de corps* and fellow-feeling among gardeners will be promoted, the idle and the incompetent who now bring discredit upon our ranks will be discouraged and eliminated, and the whole tone of the craft raised. Concurrently with this, the position of the individual worker will be improved, and we shall be spared the anomaly we sometimes meet with now, of a first-class man, one from whom first-class things are expected, receiving a wage which a day-labourer in London would not deem adequate.

Other signs of progress are visible in directly practical matters, such as the proper application of fungicides and insecticides. It has required a great deal of preaching to emphasise the desirability of putting these methods to the test, but at last it has been done and the results are promising.

Before long we may hope to see our market-growers availing themselves of the electric light for forcing purposes. The experiments have been made, and now some of the Transatlantic market-growers have adopted it for commercial purposes on a scale that is like most American things—gigantic. Need we add that it pays! Some of our correspondents were sceptical on the matter, they ridiculed it first of all when SIEMENS showed the possibility of it, but somehow the problem seems solved in America in the most satisfactory manner from the point of view of commercial horticulture. Our blood is much more sluggish than that of our American cousins, but at last we see signs of moving, and the education and co-operative movement must greatly contribute to it.

The weather on the whole has not been unfavourable for gardening work, and if the fruit crops were a disappointment [as usual?], the yield and quality of Potatoes were alike excellent.

Exhibitions and shows we have had galore—they come with wearisome iteration, and are much less fruitful in good results than they should be. Prize-winning is not the only thing to be thought of. The Royal Horticultural Society has fairly maintained its pre-eminence, and whilst its fortnightly shows never lack interest and variety, the great Temple Show was even of greater excellence than usual. The pruned Dendroles shown by Mr. PRINSEPP would have alone sufficed to render that show remarkable, whilst those who were fortunate enough to have seen the rockery arranged by Messrs. BACKHOUSE, will have treasured in their memory a little scene of beauty they may, perhaps, see rivalled in the future, but scarcely excelled. The Earl's Court shows were also excellent, the great fruit show in particular, and the administrative ability, tact, and geniality of the Manager, Mr. H. E. MILNER, displayed under difficult and discouraging circumstances, won universal admiration. Other shows, such as those got up by the National Rose Society and the Chrysanthemum Society, were of the usual high average, and excited, as usual, the greatest interest among the devotees. The great show of the Co-operative Society at the Crystal Palace was also a pleasant proof of the widely-spreading popularity and importance of horticulture.

Horticultural literature has been enriched by publications too numerous to be mentioned in detail in this cursory survey. One or two which are, or will be, landmarks can alone be referred to. Dr. OTTO KUNZE's *Revisio Generum Plantarum* is a book to set botanists by the ears. To us, it seems wildly impractical, and the author's abuse of his English colleagues, even of those who are dead, is rude and uncalled for. It might be thought that this was a matter in which botanists alone were concerned, but horticulturists have as deep an interest in the questions of nomenclature discussed in this book as the botanists themselves. It is not wise to prophesy before you know, but we do not think we shall be far from the mark when we say that Dr. KUNZE's book will have little practical effect among botanists, and still less among horticulturists.

Mr. W. PAUL's *Contributions to Horticultural Literature*, is a book of a very different stamp, and is one which, from its varied contents, the skill with which they are handled, and the justly-earned authority of the writer, will for a long time to come find a place in the most easily-accessible part of the book-shelves. Professor SARGENT's *Silva of North America* has advanced to its fourth volume; this magnificent publication is not one that the average botanist or gardener could afford to place on his shelves, but those interested in trees and their

FIG. 131.—ALLAMANDA HENDERSONI, IN THE CONSERVATORY, HOLLOWMEAD LODGE, W. BARROW, ESQ.'S RESIDENCE, BISHOP'S TEIGTON, DEVON. (SEE P. 791.)

FIG. 132.—VIEW IN THE CONSERVATORY AT HOLLOWMEAD LODGE, BISHOP'S TEIGTON, DEVON. (SEE P. 794.)

technical delineation and history may be glad to know that the book may be consulted at the Lindley Library, as well as at Kew. Sir JOHN LUBBOCK'S work on *Seedlings* is a publication of authority; and as a work of research and for purposes of reference, it will not be displaced for many a long year. The Conifer Report, published by the Royal Horticultural Society, is another substantial work, evidencing much careful research and patient labour. It forms a worthy companion to the now numerous reports of Conferences, the value of which is more likely to increase than diminish; and a similar remark applies to Mr. BAKER'S modest but sterling work on *Irideae*.

Our space does not permit us to extend our remarks, but a reference to the index, published in the present number, will show that horticultural writers have been very busy, whilst the few that we have selected for special mention prove that, in point of importance and permanent value, the average is decidedly higher than usual.

Although we have not had to lament the loss of so many friends and conspicuous fellow-workers as in some years, there has been no exemption from the inevitable decree. Among practical gardeners we have lost the venerable JAMES WILLIAMS, whose son, the well-known B. S. WILLIAMS, predeceased his father by some two years or so! Dr. WOODMAN, A. BALFE, E. COOPER, J. ELLAM, J. ROBERTS, JAMES TAPLIN, formerly of Chatsworth, EDMUND COLE, ROBERTS, of Charleville, MICHAEL SAUL, PRATT, ROBERT BULLEN, and JOHN DOWNIE, the last named taken from among us quite recently, but one whose name and fame will remain as treasured memories for more than one generation of his colleagues. The ranks of the nursery trade have been deprived of such conspicuous men as W. A. DICKSON, MARGOTTIN, of Rose fame, ROBERT PARKER, one of the apostles of herbaceous plants, C. H. SHARMAN, ANTON ROOZEN, and LOUIS THIBAUT. Among the botanists, the loss of the gentle and accomplished SERENO WATSON is a severe calamity, more particularly for American botany. REGEL, of St. Petersburg, was well known, by name at least, to horticulturists, and to many personally. The amount of work he did was very great, and its utility, especially in opening up the resources of Central Asia, commensurate. TODARO, of Palermo, was not very widely known in this country; but for all that, he will be missed by his fellow-workers.

Among other workers in science, we have to lament the loss of TENNYSON (for we claim him amongst gardeners and scientists); the much-loved Sir WILLIAM BOWMAN, the still more widely-known Sir RICHARD OWEN, one who makes us proud to be of the same country; W. H. FITCH, whose services to horticulture and botany were innumerable, and the value of which in the future will be in a peculiar sense permanent; STANTON, the entomologist, and too many others.

There were strong men before AGAMEMNON, there are strong men still. We may bow the head in sorrow at our loss, but we are cheered and encouraged by the example that remains to us, so that when another year's record comes to be written, there will assuredly still be worthy deeds done by worthy men to be recorded. May neither fall below the standard of 1892!

Our usual review of the new plants and new introductions will be given in subsequent issues.

ALLAMANDA HENDERSONI (fig. 131).—We give in our illustration a view of the interior of the conservatory at Hollowmead Lodge, Bishop's Teignton,

Teignton, Devon, exhibiting a large plant of the above. *Allamandas* need in our island to have the fullest amount of sunshine to ripen the wood, and develop fine flowers, hence the need for training their shoots within a foot or thereabouts of the roof of the boathouse. When this point in their culture under glass is attended to, it is immaterial where their roots are. It may be a large pot or tub, or a well-drained restricted border; the results in any case are likely to be good. The most suitable position in which to train the plants is the upper part of a lean-to house facing south, or the northern end of a house which is placed north by south; otherwise the dense shade afforded by a thick mass of the foliage would be inimical to most plants placed beneath it. *A. Hendersoni* is of rather bushy habit, forming short-jointed shoots, and it flowers for the greater part of the year, and often when quite small. The flowers, produced in large corymba, are of a rich orange colour, with a deeper shade in the throat; previous to opening, they are of a rich maroon colour. It is a native of New Granada. Mr. JOSEPH WILLIS, the gardener at Hollowmead, to whom we are indebted for the photograph from which the engraving was made, says of the floriferousness of this species, that it opened every two or three days from 150 to 250 flowers for five months in succession.

THE CONSERVATORY AT HOLLOWMEAD, BISHOP'S TEIGNTON (fig. 132).—Our second view of Hollowmead shows the interior of a conservatory, differing in its furnishing from the usual trim, not to say formal, disposition of the plants in such conservatories, and the former are those which grow to large size. The subjects, which, owing to their small size, must be brought up near to the eye on tables and stages, seem to be absent, the result being arrangements of a somewhat bold character.

"THE BOTANICAL MAGAZINE" for the year is dedicated to Dr. TRIMEN, the Director of the Royal Botanic Garden, Peradeniya, Ceylon.

THE QUEEN has forwarded to the Secretary of the Royal Agricultural Benevolent Institution, through Sir HENRY PONSONBY, a cheque for 100 gs. This makes Her MAJESTY'S third donation to the society, in addition to her annual subscription of £25.

MISS JAMESON.—A few months ago we had occasion to mention the sad case of this lady, the daughter of the late Professor JAMESON, of Quito, an eminent botanist, and one who did good service in making known and introducing plants from the Andes. The small sum received, £14 18s. 6d., on behalf of the afflicted lady, was paid to the account of the British Minister at Quito, who writes in acknowledgment that the amount received will at least be of some use in relieving the necessities of the lady. Dr. JAMESON, after a life devoted to useful science, died in great poverty, and left his family unprovided for. It is sad, as His Excellency remarks, that so eminent a scientific man should have had such an end.

"ILLUSTRATIONES FLORÆ HISPANIÆ INSULARUMQUE BALEARIUM."—We greatly regret to learn from the publisher (E. KOCH, of E. Schweizerbartache, Verlagshandlung, Stuttgart) that this excellent publication is discontinued, and still more so for the reason that the author feels himself unable to continue the work. In the part before us are several illustrations drawn with the usual fidelity, and described in Latin, Spanish, and French. *Anthyllis Webbiana* should be looked after by collectors for the sake of its heads of brilliantly-coloured crimson flowers. It was figured in the *Botanical Magazine*, t. 3284, but if it exists at all is not known out of botanic gardens. It grows on the higher snow-covered parts of the Sierra Tejada (Granada). It is by some considered as a form of *A. vulnearia*, but Professor WILKONM considers it distinct, especially in the stalks of the petals, which are perceptibly longer than the calyx.

GRAPE-GROWING IN CALIFORNIA.—Now that public interest is excited by the recollection of the great anatomist, Sir RICHARD OWEN, the following record of the adventures of one of his grandsons in California may be read with interest:—

Misled by the representations of interested persons, Mr. Owen leased a 30-acre vineyard lying 1 mile outside of Santa Barbara, expecting to realise several thousand dollars from the year's crop. He undertook to cultivate it himself, but, after smashing three ploughs in his endeavour to train a spirited horse to rustic accomplishments, he called in help. Before the summer was over, the pay-roll of his vineyard had mounted to a very pretty sum, but he still looked confidently at the handsome bunches hanging in the shelter of the green foliage, and counted his harvest. At about this time he bethought himself that it would be a good idea to negotiate his crop with some fruit dealer. To his surprise, he found that not a single fruit dealer or grocer of Santa Barbara would agree to take it at any price. A few Italians sometimes bought Grapes for wine, but their offers were so low that to accept them seemed a craven retreat from his high expectations. San Francisco was too far away and freights too high to send his Grapes there.

"The Grapes are there," said he, "and they are exceedingly nice Grapes—except where the mildew struck them. There is just one thing left to do. I shall not stand by and see them spoil on the Vines. I will peddle them from house to house," he said.

Some one mildly suggested to him that he might suffer disagreeable experiences, but he was not to be balked by fate or the storekeepers. He bought an old wagon from a peddler, and as soon as his Grapes had taken on a deep colour he began his new career. Being very anxious to be the first in market, and to sell his fruit while prices were high, he started out before Dame Nature had served the Grapes with their full portion of saccharine matter. That evening he presented himself at a neighbour's house in a state of riotous indignation. He presented his hostess with a basket of Grapes.

"I have had the most extraordinary experience to-day," he announced. "Everybody is accusing me of selling sour Grapes. Now, these Grapes seem sweet and delicious to my English palate. Will you be kind enough to try them, and give me the benefit of your opinion?"

The lady did not make a wry face. "They are very nice," she said.

The keen sense of the young Englishman detected the reserve in her speech.

"I shall have to give up," he said, with a merry laugh. "And I'll own to you, that these are some of my choicest specimens. All that I took out did not come up to these. And you Americans have such an awfully sweet tooth. Still, I would have got along very well if I could only have persuaded my customers to try my samples."

"I picked out my nicest and ripest specimens and put them in a basket, along with a few other bunches that were not so ripe," he continued. "The first house that I visited was that picturesque Swiss Cottage on the hill. It is inhabited by an old maid. How do I know? A feather duster hangs beside the door, as a suggestion to people to brush the dust off their feet before entering. Wherever a feather duster is hung out in Santa Barbara there is an old maid within. It is an infallible sign. This lady was very nice, however, and when I asked her if she wanted to buy some Grapes, she responded with a cordiality that made me rejoice in my calling. 'But it is very early for Grapes. Are they sweet?' she asked. 'Try one,' I rejoined, with confidence. I pointed to a luscious bunch. She reached beyond it for another, and my heart quaked. She made a wry face. 'Try this one,' I insisted, pointing to one of my samples. 'I prefer to try this,' she replied, and to my horror she reached for another that was a little off colour. Then she beat a hasty retreat, saying politely, 'Thank you, but I believe I do not care about any Grapes to-day.' I have repeated this experience all day, in different keys. Fortunately, I started out with but little fruit. Now I shall lay off for a week or two, till the Grapes are riper."

A couple of weeks later Mr. Owen took up his new profession in good earnest. He was snubbed and patronised, haggled with over prices, impatiently turned away, or kindly invited to rest, and his wares were praised as cordially by one customer as they were depreciated by the next. He enjoyed some experiences that he would not have been likely to encounter if he had canvassed the United Kingdom for a lifetime in a similar capacity. Kind-hearted old ladies noticing his refined manners and his English accent, were perpetually inviting him to take a cup of tea, attentions which he appreciated, but, it is needless to say, courteously declined, for he was disinclined to mix social and business matters. Occasionally he had an amusing encounter. He aimed to avoid the houses of his few acquaintances, but now and then he stumbled upon one, and explanations ensued, or an embarrassing scene occurred, according to the real gentility of the people.

Alan Owen's career as a peddler was of short duration, but he did not forsake it because he was at all daunted by its results. He had been for some time conducting negotiations for an important stock range over the mountains. The bargain was consummated. He sold the remainder of his Grape crop to the Italians, a younger brother and two other young English gentlemen came out from England to join him, and he is now herding his cattle over 75,000 acres of land. He has taken out his first naturalisation papers, and expects in a few more years to become an American citizen.

The remainder of the article from which we quote

is contained in the *San Francisco Examiner* of November 27, and contains a letter never intended for publication, and which it would have been better to have left unpublished.

M. PASTEUR.—The seventieth birthday of this distinguished man of science, who has probably been privileged to confer more wide-spread benefit among the human race than any other man, was celebrated in Paris on Tuesday last. Among the speakers was Sir JOSEPH LISTER, the famous English surgeon, who presented to M. PASTEUR an address from the Royal Society written in the hand of the President of that body, and in handing the paper to him spoke as follows:—"Truly there is not a living man to whom medical science owes more than to yourself, M. PASTEUR. To you is due the complete revolution which has been brought about in surgery. You have cleared it of its errors and enlarged its power of good to an almost limitless degree. Medicine, too, owes no less than surgery to your profound studies in physiology. You have raised the veil which for centuries obscured infectious maladies. By your marvellous system of inoculation against rabies you have succeeded in pursuing the poison after its entry into the system, and in vanquishing it. You can, therefore, understand that medicine and surgery are desirous on this solemn occasion to lay before you the homage of their profound admiration and gratitude." On the opposite shore to Folkestone on the quay at Boulogne is a statue to JENNER, with the simple inscription "La France reconnaissante." A similar tribute on our side to PASTEUR would be in the highest sense appropriate.

HARD FROST.—A correspondent at Hawick writes, under date of December 26, that on Christmas day the Fahrenheit thermometer registered 24° of cold, and the same degree was maintained on the following day. There was no snow on the ground. At the other extremity of the island the frost has been nearly equally severe.

"THE GARDEN ANNUAL," which has evolved into a perennial, is one of those useful books which it is desirable to have upon the office desk or in the gardeners' office.

PRESENTATION.—On the afternoon of Friday, December 23, Mr. P. NEILL FRASER, the Treasurer to the Royal Caledonian Horticultural Society, was presented with a handsome service of plate in recognition of the gratuitous services as treasurer of the society during the long period of twenty years. The presentation took place at the Royal Hotel, Princes Street, Edinburgh, Mr. J. CLAPPERTON presiding over a gathering of leading horticulturists. Allusion was made by the President to the great advances made by the society, whose funds in 1871 amounted to £90, whereas now they were £1200. At that time their receipts, including the drawings at the annual show, amounted to £350, while last year they were £1600. Mr. NEILL FRASER suitably acknowledged the presentation.

THE BENEFICIAL INFLUENCE OF PHOSPHORIC ACID ON PLANTS.—Phosphoric acid is, as is well known, a common constituent of soils and of the artificial manures, but its peculiar influence upon plant life has hitherto not been understood. The green colouring-matter of plants is called chlorophyll. HOPPE-SEYLER in 1879 found that this substance contained phosphoric acid, and suggested that it was a normal constituent. Struck with this view, and following up an observation of his own, Herr C. LOEW has been trying to cultivate *Spirogyra majuscula* in a nutrient solution, containing per thousand, 0.2 of calcium nitrate, and 0.02 of ammonium sulphate. The plants grew very sickly: the chlorophyll layer became very pale and yellowish, whilst its movements were performed sluggishly. In adding 0.02 per 1000 of ferrous sulphate, and dividing the cultures into two lots, to one of which was added 0.08 per 1000 of disodium phosphate, a great difference was observed. After five days, those cultures which received the phosphate became dark green; cell division took place, and the chlorophyll move-

ment became lively. The cultures receiving the iron alone did not show this recovery. Loew's original paper may be consulted in the *Ann. Agronomiques*, xviii., pp. 270, 271.

CALCIUM OXALATE IN THE BARK OF TREES.—Some interesting experiments have just been concluded by Herr G. KRAUS, who has been studying the occurrence and distribution of calcium oxalate in the barks of various trees, with a view to determining its function. In a paper given at length in the *Ann. Agronomiques*, xviii., pp. 271, 272, he describes his investigation, and concludes that calcium oxalate is not an excretion, as some have supposed, but a reserve deposit, and that it is redissolved in spring and summer according to the needs of the growing tree. Branches of *Ribes sanguineum* lost, from December 16 to April 27, 16.62 per cent. of their calcium oxalate; from March 13 to April 3, 13.17 per cent.; and to April 16, no less than 38.07 per cent. Similar results were obtained in experiments with other trees. Herr KRAUS remarks that calcium oxalate is certainly liable to solution by the long-continued action of an acid-circulating liquid such as cell-sap is.

COMPOSITION OF APPLE TREE LEAVES.—The leaves of Apple trees, and probably of most trees, undergo during the course of the season very important changes in composition. Leaves collected from five varieties of Apple trees have been examined by Herr F. T. SCOTT during the season of 1892. Two analyses were made, one on May 25, and the other on September 20. The following table shows the average composition of Apple tree leaves on these dates:—

Constituents:—	May 25.	Sept. 20.
	Per cent.	Per cent.
Water	73.36	60.71
Ash	2.33	3.46
Nitrogen	2.94	2.48
<i>Composition of the Ash:—</i>		
Phosphoric oxide	10.47	5.82
Potash	10.82	11.63
Lime	17.41	27.91
Magnesia	9.77	4.81
Iron oxide	1.49	1.41
Silica	1.07	1.14

Other interesting analytical data are given in the original paper describing this investigation, which may be consulted in *Biedermann's Centralblatt*, 1892, pp. 493, 494.

CRANBROOK GARDENERS' SOCIETY.—The annual general meeting was held at the Bull Hotel on the 19th inst., the chair being taken by Mr. J. STAPLEY. The secretary submitted the annual report and balance-sheet, which were adopted. The latter showed that the receipts during the year amounted to £135 12s. 2d., and the expenditure to £143 17s. 10d., leaving a balance against the Society of £8 5s. 8d. The number of members was as follows:—Honorary members, 52; members, 106; cottagers, 46. The prizes for extraneous points awarded to cottagers during the year were then presented. A Special Certificate was presented to Mr. A. SMITH, gardener to the Misses APPACH, Swatenden, for the splendid group of *Chrysanthemums* exhibited by him at the autumn show. In the professional class the following Certificates were presented:—C. GROWNS, First-class; H. BROWN, Second-class; and A. HICKMOTT, Third-class. Amateurs' class:—J. ROBE, First-class; A. HINKLEY, Second-class; and S. BURNHAM, Third-class.

THE ELECTRICAL HEATING OF FORCING-HOUSES.—We have frequently noticed the application of electricity in the illumination of conservatories, &c., and now M. OLIVET, of Geneva, has devised a special form of heating apparatus for use in forcing-houses, which is supposed to be superior to the ordinary hot-water or steam installations.

The current from a main or special dynamo is conducted into what are termed "receivers," which are made of high-resistance metal. The resistance to the passage of the current results in the evolution of heat; the "receivers" are rapidly heated, but the temperature cannot exceed a given degree. The "receivers" heat the atmosphere, and warm currents of air circulate through the building, bringing the whole to an equable temperature. Nonwholesome gas or vapour, that might injure the plants, is produced, whilst amongst other advantages are simplicity of construction, safety from boiler-bursting, the perfect regulation of the heat, convenience and rapidity in starting and extinction, cleanliness, &c.

THE RESPIRATION OF PLANTS WHEN INJURED.—Some curious experiments have recently been conducted by Herr STICH upon a large number of plants, in order to ascertain the effect of injury (from mere scratches to complete cutting up) on their respiration. He noticed in every case that there was an increased separation of carbonic acid gas when the plants thus had their tissues damaged. As might have been expected, various plants and their various parts behaved differently with regard to the extent and duration of this increased secretion of carbonic acid. Further details may be found in STICH's paper, for which vide *Biedermann's Centralblatt*, vol. xxi., p. 350.

HORTICULTURE, ET CETERA!—It is curious that our French neighbours, who certainly have not the same reputation for prudery that we have, nevertheless hesitate to combine horticulture with such attractions as BUFFALO BILL, the Bounding Bricks of Babylon, Boxing Kangaroos, and the like. One of our French contemporaries, however, holds our plan up as worthy of imitation on the ground that many people who would never visit an ordinary flower-show have the chance of profiting by the teachings of horticulture at these variety entertainments. The object, says our contemporary, of the exhibitor is to show his plants to possible purchasers, and there is a better chance of doing this in places where the public is amused, rather than where it is bored. This is the commercial view; but horticulture is something more than a thing to get money by.

PLANTING POTATOS.—The question of the right number of eyes to the piece of seed tuber has long engaged the attention of cultivators and experimenters, without receiving a generally acceptable answer. The experimental data brought forward at the Purdue University Agricultural Station, *Bulletin*, n. 42, 1892, prove that the number of eyes per piece is immaterial, but that the weight of the piece is a very important factor. The proper manner of cutting Potatos for planting, therefore, is to divide them into pieces of suitable weight (size), without regard to the distribution of the eyes. Instead of attempting to have one, two, or three eye pieces, as the case may be, the approximation should be to one, two or three ounce pieces, or some other definite weight.

HYBRID ORCHIDS.—Mr. GEORGE HANSEN, of the College of Agriculture, University of California, Jackson, Amador co., is compiling a list of hybrid Orchids, together with information concerning their parentage, &c. Mr. HANSEN is a diligent worker, and while in this country studied Orchids with attention, and made numerous sketches. Mr. HANSEN is anxious before publishing his list to get the assistance of raisers in this country on certain doubtful points.

HAGLEY COTTAGE AND ALLOTMENT GARDENING ASSOCIATION, STOURBRIDGE.—This Association had its commencement at a meeting held on February 6, at Hagley, under the presidency of Lord COBHAM. There is in each of these parishes a Cottage Gardening Society, holding meetings from time to time, at which gardening matters are discussed. These parochial societies form the Association, and it is through this central body that it is proposed to offer awards for really good cultiva-

tion of (a) cottage gardens, and (b) allotments of smaller size. It should be noticed that the Association desires to encourage not merely a few prize gardens, but a general standard of good gardening in the district. So far as funds will permit, it is proposed to give first-class awards to the very best gardens or allotments, and second-class awards to those whose culture is only a little less good. No man, therefore, will be striving against another, but each to bring his own ground to the highest possible perfection. The scheme has had full consideration, and has already received promise of cordial support. Out of forty-six entries for 1892, two gardens received "excellent" awards, amounting to 15s. in kind; and twenty-eight "good" awards—10s. in kind. The number of entries promises to be much larger.

FARRINGDON MARKET TOLLS.—It was contended at the time of opening this market, that the levying of tolls would operate against the taking of stands—and against the best interests of the market. The "beggarly account of empty benches" has justified the contention—the Markets Committee of the Corporation has seen the error of its ways, and from January 2 the exaction of tolls will be suspended for a year.

LORENZ'S WHITE MAMMOTH TEN-WEEK STOCK.—This fine Continental novelty is the perfection of a summer Stock, being of robust growth, growing in good soil to a height of 3 feet, and furnished with a flower-spike 1 foot in length, closely covered with large symmetrical blooms of pure white. It is recommended to be planted in large groups, for which its height renders it admirably suited.

PLANT PORTRAITS.

AGANISIA IGNOPTERA, Nicholson, Hook. f. in *Botanical Magazine*, t. 7270; *Gard. Chron.*, 1871, p. 1451. Native of Peru.

ALLOPLEGUS LYNCHETI, Hook., *Bot. Mag.*, t. 7271. —A fine stove plant, supposed to be a native of New Granada, with lanceolate leaves, purple on the under surface, and dense clusters of shortly-stalked flowers with pink calyces and irregular tabular yellow corollas, each about 1 inch long.

AMELANCHIER CANADENSIS, *Garden*, December 17, with notes on the genus by G. Nicholson.

CATTELEYA DOWIANA VAR. **STATTERIANA**, *Lindley*, t. 356.

CATTELEYA HARDYANA × VAR. **GARDENIANA**, *Lindley*, t. 353.—A cross between *C. gigas* and *C. Dowiana* or *arcea*.

DIPLADENIA ATRO-PURPUREA CLARKEI, *Gard. Mag.*, December 10.

FERULA TINGITANA, Linnaeus, *Bot. Mag.*, t. 7267.—A noble Umbellifer, formerly, but erroneously, supposed to yield ammoniacum. Native of Northern Africa and Syria.

HEUCHERA SANGUINEA, Engelmann, *Gartenflora*, t. 1384.

KNIPHOFIA PAUCIFLORA, Baker, *Bot. Mag.*, t. 7269; see also *Gard. Chron.*, 1889, vol. II., 65, f. 10.

MILTONIA YENI LARIA VAR. **VERGINALIS**, *Lindley*, t. 354.—A variety with pure white flowers.

MICROSTYLIS SCOTTII, Hook. f., *Bot. Mag.*, t. 7268.—A terrestrial Orchid from the Malay Peninsula, with oblong-lanceolate undulate leaves of a bronzy colour and margined with a white stripe. Flowers curious.

ROBINIA NEO MEXICANA, *Gartenflora*, t. 1385.—A tree like the common *R. pseudoacacia*, but with pink flowers. New Mexico.

SOLANUM SEACORITHANUM, *Garden*, December 10.—Like *S. jasminoides*, but with lilac flowers.

VANDA INSIGNIS, *Lindley*, t. 355.

ROUND MANCHESTER.

(Continued from p. 731.)

PICKERING LODGE, TIMPERLEY.—Here George Hardy, Esq., has a very good example of an English homestead, an extensive estate, producing largely most of the things necessary for daily consumption. The garden, by its dissimilarity from those generally seen, is an interesting one, the great feature in it being the fine banks of clipped Hollies, Yew, &c. which are on either side of the carriage drive leading to the house. These fine pyramid trees, ranging from 6 to 12 or more feet in height, receive a great amount of attention, which they amply repay by their quaint beauty. They are one and all perfect down to the ground, and Mr. Hardy considers that the mulching of spent hops which they get at this season every third year, has much to do with their beauty of foliage, and generally unfailling vigour. The large bank of Rhododendrons on the other side of the smooth lawn is equally fine, and the huge planted-out Camellias in the ornamental conservatory a sight worth beholding, the largest, an old double white, having buds which must number thousands.

The Rockery, by Clapham, which is entered from the dining-room, is one of the finest things of its kind known. It represents a rocky gorge in a tropical clime. The winding walk over and among natural rock, and beside rivulet and cascade, which flows under and among the elegant frondage of the Tree Ferns and the dwarfier Ferns and mosses, is strikingly realistic; and the best testimonial that the artist could get is the fact that Mr. Hardy says that the £1100 which it cost, he paid cheerfully, and has never regretted since. But for

THE ORCHIDS.

Everyone goes to Pickering Lodge, and to them we must proceed. The collection is well-known for being one of the very best we have, of showy things, and especially of rare varieties of them, many of which are here to be found by the dozen, which are only seen in single and small specimens in most other places. This is at once observable in the first house we enter, the large Cattleya-house 80 feet in length by 18 feet wide. Here we are confronted by a couple of dozen fine plants of proved true Cattleya Skinneri alba, the largest of which is a wonderful specimen with fifteen flower-sheaths. The first large mass purchased originally cost £200, but the stock would realize figures far beyond that. Another grand specimen is *Lælia Boothiana*, with over 250 bulbs, and 25 flower-sheaths; further on, we see specimens of *Lælia purpurata* and *Cattleya labiata vera*, almost as large. Of this last-named, there is a large quantity here, and it is a great favourite, as well it merits to be, for its flowers give a most welcome brightness to the houses in the dullest season. Other grand specimens of fine things are *Cattleya Mossie Reineckiana*, *C. M. Wagneri*, *C. Harrisoni alba*, *C. Lawrenceana* (with thirteen flower-sheaths), many *C. Warszewiczii*, *C. Mendeli*, and of course that original property, the true indisputable *C. Hardyana*. Forms, or allies of it, there are here, too, in plenty, such as the true *C. Massiana*, *C. aurea marmorata*, &c.

There is a splendidly vigorous appearance about the Pickering Lodge Cattleyas and *Lælias*, and there, as elsewhere, where these things are done up to their best, cautious watering, and especially when the plants are not actively growing is the order of the day. It is now generally known that lightly-watered Cattleyas, *Lælias*, and Brazilian Orchids generally, root well and flower freely, while those heavily watered all the year round make little or no root, and quickly die out. From end to end the plants in Mr. Hardy's Cattleya-house furnish examples which might be particularised, and all speak highly of the clever culture and care bestowed on them by Mr. Holmes, the gardener, at Pickering Lodge.

In another house the bulk of the contents is made up of selected varieties of *Miltonia vexillaria*, among them being a dozen plants of the rare *M. v. superba*, which has the base of the labellum of a dark blood-

red. With them are grown the fine specimens of *Masdevallia chimæra* and its allies, and some noble masses of *Epidendrum vitellinum majus*, &c., there being a bright show of scarlet *Sophronitis*, *Odontoglossums*, and other flowers of the season. In the next house, in front of the doorway, stands a huge specimen of *Cymbidium Lowianum* with twenty-two flower-spikes; whose beauty can well be imagined. In the same house a plant of *Cymbidium grandiflorum* is producing two spikes of its large green-petalled flowers, and there are a wonderful lot of specimens of *Cœlogyne cristata*, the largest of which are grown on revolving-tables, and in that manner the specimens, which, by their great weight, it would otherwise be impossible to move frequently, can daily be turned round with ease, and inspected in every part. In the same house are some very well-flowered varieties of *Lælia anceps*, *L. a. Sanderiana* being one of the best of the whites, and *L. a. Schroderæ*, a quaint, but rather small pink-tipped flower, the narrow labellum of which is very dark in colour.

In the next house the specimens of the old *Zygopetalum Mackayii* make a fine show, and the *Cypripediums* are good, and especially the forms of *C. Leeanum*, of which *C. L. giganteum* is one of the noblest of known *Cypripediums*. Already there is a demand for it in excess of the capabilities of the stock, and they who secure it now will well invest their money. With the *Cypripediums* here are two fine plants of *C. macrochilum* ×, which although positively the same as that raised by Messrs. Veitch, and illustrated in the *Gardeners' Chronicle*, was raised from *C. caudatum* instead of *C. Lindenii*, as the one parent (i.e., the ponched *C. caudatum* instead of the ponchless one), and a different variety given as the other parent. Other noteworthy plants in this house were several of the charming fragrant *Vanda Amesiana*, with a large quantity of flower, one spike alone bearing over fifty of them; the scarlet *Epidendrum radicans*, *Oncidium Lanceanum*, and various fine *Vandas*. Passing through the other houses, we note in one over two hundred flowers of *Cattleya labiata vera*; in the range of cool-houses in four divisions, a splendid lot of *Odontoglossums* and showy masses of scarlet *Sophronitis*, a fine house of *Phalenopsis* in grand health, a house of the rarer *Cypripediums*, a healthy collection of *Masdevallias*, and a large lot of *Dendrobiums*, with marvellous growths, among them being *D. crassinode album* with seven flowering spikes.

So much is heard at times about Orchids dying out, that it should be comforting to buyers of rare things to hear of such collections as Mr. Hardy's, where the fact is demonstrated that the dying-out complained of is not from anything in the nature of the plants themselves, but from some inconsistency in their culture.

CHRISTMAS ROSES.

During the Christmas season, one of the most popular flowers is certainly the Christmas Rose—essentially a flower naturally in season, and this notwithstanding the plant is not at all common, unless it be in church decorations, or in the homes of the well-to-do, and it is by no means the universally popular flower which it should be.

At first sight, seeing its perfectly hardy nature and perennial character, this is difficult to understand, and the more so when we remember the vast quantities of other flowers which are produced for the Christmas season at much cost of fuel and labour, and it seems almost that the plant is suffering from the neglect of the gardener.

It is a plant peculiarly well adapted for the amateur gardener, should he have a greenhouse or a cold frame, and he could readily grow a few pots of it, which might, as the season of flowering approached, be lifted and transferred for a time to the frame, and thus secure greater purity of the white blossoms.

To have the plants in good condition, it is necessary that they should be potted a year in advance of being required, and to treat them liberally from the

first, and so attain success. It is not essential to begin with large plants—that is, if it is desired to grow them always in pots, pans, or tubs—but rather to choose those of medium size, which have plenty of good foliage, as such will be found to have a proportionate quantity of good roots. Put them carefully into pots large enough to carry them for two years without loss of vigour, and use a fairly rich soil, consisting of rather heavy loam three-quarters, decayed manure one-quarter, the whole being passed through a half-inch sieve, and mixed afterwards with charcoal or old mortar-rubbish, and a little sharp-sand. The roots should be spread out, not packed in a mass together, this being detrimental to their well-being. Make the soil firm about the roots, and let it be as high as the summit of the crown, allowing ample space above for affording water. A good watering should be afforded after potting. The last essential detail is that the pots, &c., be plunged their full depth in a cool and partially-shaded position, allowing the base of the pot to rest on three other smaller ones, so that the drainage may be complete. Once in position, little attention will be required, save in hot summer weather occasional supplies of water and weak liquid manure, neither of which should be neglected or overlooked. In a similar way, though on a more extended scale, should Christmas Roses be grown in large quantities.

In all cases where large plants are lifted they should be broken up into several pieces of some two or three crowns each, rather than run any risk by planting the whole lump as lifted. Frequently when this has been done the plant is ruined for years, owing, I believe, to the points of the roots having been injured in the lifting, and also from the fact that the new roots which issue from the base of the crown-growth are unable to push through the mass of inert soil forming the ball. It is a very different matter, however, where the roots are laid bare, and brought in contact with fresh soil, when new fibres are soon formed on the larger fleshy roots. In the open ground their cultivation is by no means difficult, if the soil be fairly rich and deep, and the plants abundantly watered in dry weather. Helleboreas of this section are very impatient of frequent disturbance, and if the planting of them cannot be done in the early autumn months, it should be taken in hand prior to the new foliage appearing. J.

HOME CORRESPONDENCE.

THE GARDENERS' ORPHAN FUND.—This fund evidently does not receive the amount of financial support which was generally expected from the country gentry, although there are many worthy notable exceptions. Employers of gardeners, strictly speaking, are the very people who derive the greatest amount of pleasure and profit from the gardener's skill; moreover, they show by their own avoidance of the unhealthy atmosphere of the hot-house that they are fully aware of the dangerous occupation of those who have to work therein for many hours together. I hope my experience does not coincide with many of the local secretaries who have undertaken to canvass for annual subscribers to this institution; that is, by the peculiar excuses given for refusal. One reason for refusal being that this sort of thing is indirectly responsible for much pauperism by encouraging improvident and selfish parents to wilfully neglect to make provision either for their own children or themselves. Others again refuse upon the grounds that they never support any institution which opens its doors to one class of recipients only. They call it a clanish institution, and say has no right to ask help outside its own class. Others there are who declare that they set apart the proverbial one-tenth of their income for charitable purposes, and regret that they see more deserving objects, consequently better channels for their money. There is yet one more kind of non-giver, and by far the largest, who pretend that they cannot afford to become subscribers, but seeing that the liabilities of an annual subscriber may be reduced to one penny decimal per week, or 5s. per annum, nothing more need be said. These are unpleasant, but, nevertheless, actual facts, and have to be recorded and dealt with. Under

which of the above headings the good Samaritan is to be found I must leave wiser heads than mine to conjecture, but I do think that excuse No. 2 should give gardeners the cue for active enthusiasm, and the noble effort for independence. With a view of drawing other opinions and methods of procedure how to accomplish this, I beg leave to suggest that head-quarters be petitioned to empower local secretaries to form a sub-committee of half-a-dozen members for each county in Great Britain, who should undertake to make a complete canvass of every gardener in each county, working out their own details, and mapping out a district most convenient for each of themselves, under a few general rules from the head-committee. An impetus would thus be given to local efforts, and doubtless, if such an arrangement were taken up with energy, and faithfully carried out, a large number of subscribers would be added; anyhow, it would show a complete return of "yess" or "nays," and prove a valuable document for future use and consideration. Possibly these same sub-committees would collect the annual subscriptions by a certain date, and forward the amounts, as under present arrangements some are asked twice, and they are naturally somewhat indignant about it; we should then be able to dispense with the collecting-boxes, and the obnoxious collecting-cards could be abolished, whilst the Society would secure greater dignity, and the disagreeable word "Charity" expunged. Of course, I have assumed that the local secretaries would undertake the work; at all events, I am myself willing as regards Worcestershire, W. Crump, *Madresfield Court*.

YELLOW FLOWERED CHRYSANTHEMUM MAXIMUM.—Two or three weeks ago I mentioned, under this heading, a seedling which had come up with others, apparently *Chrysanthemum maximum*, and had produced a yellow flower. I conjectured from its surroundings that it might be crossed with *Anthemis tinctoria*, though such a cross seemed surprising. The flower was exhibited before the Scientific Committee of the Royal Horticultural Society, and proved to be *Grindelia inuloides*. How it got where it was is a mystery, as I have never sown any kind of seed in that part of the garden, though ten years ago, in another part of the garden, I had a plant named *Grindelia hirsutula*, which may have been really *G. inuloides*. C. W. Dod, *Edge Hall*.

CHRYSANTHEMUM SPORTS.—On referring to the National Chrysanthemum Society's catalogue, I find that my memory was at fault, and that "E. M.'s" notes on the variety *Miss M. A. Haggas* (p. 771) are correct. My plants have, therefore, each of them merely reverted one generation. I have not the slightest doubt as to the correctness of the labels. W. H. Divers, *Ketton Hall, Stamford*.

WASHINGTONIA FILIFERA.—I have lately seen the photograph of the *Washingtonia* in Mrs. Richardson's garden, the reproduction of which in the *Gardeners' Chronicle* I suggested represented a *Sabal*, and not the *Washingtonia*, as neither the spines on the leaf-stalks nor the filaments of the leaf-blades, which are characteristic of the latter *Palm*, were present (p. 677). The fault appears to have been with the engraver, as both filaments and spines are clearly shown in the photograph, though they are omitted in the engraving published on p. 591. W. H.

EUROPEAN RHODODENDRONS.—Instead of *Simonsii* as printed in my last communication, p. 731, read *Smirnowii*. This *Rhododendron* and *R. Ungernii* are from the Armenian frontier. Mr. Watson, in his second article on *Rhododendrons*, reduces *R. myrtifolium* (Schott & Kotschy) to a variety—but it is a recognised species, and *R. ferrugineum* might just as well be called a variety of *R. hirsutum*. *Halleense* (*superferrugineum* and *hirsutum*) and *hirsutiforme* (*subferrugineum* and *hirsutum*) are intermediate forms of a natural cross between *R. ferrugineum* and *hirsutum*. These *Rhododendrons* were found near Hall in Tyrol, by Peter Gremlich. I have from an artificial cross between these two *Rhododendrons* obtained about fifty plants, and amongst them at least ten different forms. But *R. myrtifolium* is not to be confounded with these. It is a species from the Transylvanian mountains. O. Forster.

RHODODENDRON PONTICUM POISONOUS.—I do not remember reading that the leaves of this plant are poisonous, but such is the case, for some sheep got out of a field close to my house and ate more or less of the leaves. A veterinary surgeon was called in, and found half-chewed leaves in the stomachs of the animals which died. When asked

if he had ever seen a similar case, he said that he distinctly remembered a quantity of prunings of *Rhododendrons* being thrown on a bonfire which were not completely burned up, sufficient being left to kill twenty-three sheep. He also mentioned a case of one of our regiments abroad which had several of the men very ill by eating honey gathered by bees principally from *Rhododendrons*. J. Rust, *Edge Castle*.

GARDENERS' ROYAL BENEVOLENT INSTITUTION.—The correspondence now appearing in the *Gardeners' Chronicle* must result in an amount of good if only by drawing the attention of the horticultural public to the existence of the institution. However surprising it may appear, it is without doubt a fact that the institution is almost unknown beyond the circle of members and the few generous donors who recognise the claims of the institution. The greatest question to me appears is—what can be done to advance the claims of the institution, and make it better known, without the expense of advertising to such an extent as some public bodies deem necessary? My reply to the query is this. If every gardener who is a member, and takes a real interest in the welfare of the institution, made a practice of introducing the subject to his friends and brother-gardeners within the circle of his acquaintance, the result must be an advantage in making the claims of the institution better known, and adding a few more annual subscribers to the list. I am quite convinced that this is necessary, and could give instances of total ignorance as to the existence and working of the institution. One instance only I will mention: A few weeks ago, a son of mine, who is in a nobleman's garden, wrote asking me to send him a copy of the rules of the institution, as the head gardener wished to see them. Of course, I at once posted the last annual list of subscribers, with rules, &c., and I hope and trust it will result in one more guinea being added annually to the list. In my own case (though, some twenty years ago, not a very old member) my attention was drawn to the claims and advantages of the institution by an old friend and member of the above (now, no more), who I am glad to say never needed the help it bestows; but at that time, like many others, having a young family, I could not see my way clear to pay the annual subscription, being already a member of the Manchester Unity. But I never lost sight of the claims, which (after studying the rules) I considered the institution had upon every member of the gardening fraternity; and as soon as I could conveniently do so, I sent my first guinea with great satisfaction to myself to add one more name to the list. In respect of any alterations to the rules, I must express my strong dissent to anything like putting the institution on the basis of a mere trade society; in which case we should without doubt lose the support of the few generous donors who so liberally help the institution. Your correspondent, John Chinnery, in my opinion, hits the right nail on the head, when he says (page 743), let every gardener who has not done so, join this institution, and so receive eventually the benefit of their own charity. Of course, it is impossible to hold a meeting convenient to the bulk of subscribers, and a great many like myself can only express their opinions through your indulgence. Some of the members of the committee are personally known to me, and some others are as "household words" to the gardening fraternity, and I have every confidence in them, and trust their deliberations at the meeting will result in the continued prosperity of this valuable institution. I am always pleased to see any reference or note concerning it in the *Gardeners' Chronicle*, and I firmly believe the only need it has is to be better known, and better supported by the gardeners of the United Kingdom. R. Watson, *Lincolnshire*. [We were unable to publish this letter before the meeting, but we shall be glad to print other expressions of opinion before the annual meeting. Ed.]

AGRICULTURAL DEPRESSION.—Various proposals have been propounded for the improvement of the agricultural classes; but these are more or less debatable, and a considerable time must elapse before any appreciable benefit can accrue from them. May I beg the insertion of this letter, in order to point out a direction from which material benefit may be secured meanwhile? I have given attention to the circumstances attending the production and consumption of home farm produce for more than twenty years, and it is clear to me that the present situation is chiefly due to the isolation that exists between the agricultural and the industrial classes. Whenever an effort may be made to enable the subjects to be mutually considered without any

regard to politics, great good will ensue for both. Farmers do not appear to realise the existence of facilities which could be advantageously utilised by them, and would remedy most of the difficulties they complain of, thus:—1, The industrial classes possess about 1500 stores in all parts of the country, the membership of which comprises about one million families, whose aggregate consumption is very large. 2, They also own several most extensive flour mills and bakeries in different parts of the country, with whom a working arrangement might be made. 3, That the Jewish system of slaughter and meat preparation where utilised would render it impossible for foreign or unhealthy meat to be sold as prime home-grown. 4, That the railway rates and facilities furnish means for the distribution of farm produce from the agricultural districts to the adjacent centres of consumption, which are not available for foreign importations. 5, That a uniform system of classification and packing would enable farmers to arrange with retail shopkeepers to sell their produce to consumers upon the same commission basis as that on which sales are now made in the market. Thus our farmers can command a natural protection, far more effective than any artificial one. On the other hand the industrial classes do not appear to understand—I, That when they buy home-grown produce they buy "food and work," and when they buy foreign produce they buy "food" only. 2, That if quality and nutritive value are taken into consideration, we buy nothing cheap from abroad—prices for most things being higher now than were paid to our farmers fifty years ago. 3, That the industrial classes constitute the chief consumers of the nation, and determine the extent of employment that should be available for themselves. 4, That by concentrating their purchases upon home-grown produce they would secure more work at increased wages, with better food at the same prices. The limits of a letter do not enable me to enter into the numerous details incidental to the preparation, transit, distribution and realisation of produce, and to indicate the preventable losses of quality, quantity, and value that take place in every commodity in each of the stages named. Neither can I dwell upon the extra labour that would be created by the diversion to home-produce of some of the capital that now unnecessarily goes abroad to pay for foreign labour. To obtain a practical result it is desirable that a conference be held of representative farmers, working men and others, who would meet for several days and carry out a series of definite trials with produce of all kinds, at the same time to discuss the subject in all its bearings; thus they would not only hear but actually see what can be accomplished by organisation and co-operation for the systematic distribution and profitable sale of home produce. I have prepared the details of such a conference, and indicated the lines on which it would result in practical utility, and I forward herewith a copy of the document. D. Tallerman, Author of "Farm Produce Realisation," 15, Rochester Square, London, N.W., December 13, 1892.

FLOWERS AT CHRISTMAS IN SOUTH DEVON.—I think the enclosed list of flowers, picked by me here on Christmas Day, all growing out-of-doors, may interest your readers:—Yellow Banksian Roses, three bunches; pink China Roses, Magna Charta, Pauline Labonté, red and China Roses, Lapageria rosea—all of these have been growing on a west wall since 1878; Cytisus, Scabious various; Carnations, Jasminum nudiflorum, Heartease, Erica mediterranea, Iberis, Arabis albidia, Chimonanthus fragrans, Leptospermum prostratum; Violeta Czar, Marie Louise, and Swanley White, blue Periwinkle, Polyanthus, Garrya elliptica, Centaurea montana, Christmas Roses, Tussilago fragrans, Chrysanthemum various; Geranium sanguineum, Schizostylis coccinea, Choisya ternata, double white Daisies; Rosemary, Fuchsia glohosa, Mignonette, besides scarlet Rhododendron, double Wallflower, Laurustinus, Andromeda, Berberis Darwinii and B. stenophylla, white Veronica, Escallonia macrantha, Cydonia japonica alba, and Arbutus. Gertrude Rolle.

TRADE NOTICE.

Messrs. Hurst & Sons of Houndsditch, celebrate the jubilee of their firm, and supply in their catalogue portraits of the founders and of the present head of the firm. The firm is relinquishing its trial ground at Chelmsford, and has taken much more extensive grounds at Kelvedon.

ENQUIRY.

"He that questioneth much shall learn much."—BACON.

LOCAL BOARD.—Will some reader kindly state where a Book containing the formation and duties of a Local Board can be obtained, or give the title of a book bearing upon the subject? Hortus.

THE WEATHER.

[By the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

The districts indicated by number in the first column are the following:—

- 0, Scotland, N. Principal Wheat-producing Districts—
- 1, Scotland, E.; 2, England, N.E.; 3, England, E.;
- 4, Midland Counties; 5, England, S.
- Principal Grazing, &c., Districts—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; (* Channel Islands.)

THE PAST WEEK.

The following summary record of the weather for the week ending December 24, is furnished from the Meteorological Office:—

"The weather was mild during the greater part of the period, but towards its close it became much colder. During the middle part of the week thick fog prevailed in the east and south-east. Very little or no rain was experienced, except in the extreme north and west.

"The temperature was above the mean in all districts, the excess varying from between 1° and 3° in Great Britain to as much as 5° or 6° over Ireland. The highest of the maxima were recorded on the first day of the period, and varied from 50° in 'England, S.' to 57° in 'Scotland, E.,' and 58° in 'Ireland, S.' The lowest of the minima were registered, as a rule, on the 24th, and ranged from 12° in 'Scotland, E.,' 15° in the 'Midland Counties,' 17° in 'Scotland, N.,' 18° in 'Scotland,' and 19° in 'England, N.E.,' to 31° in 'Ireland, N.,' 34° in the 'Channel Islands,' and 38° in 'Ireland, S.' During the earlier part of the week the night minima were very high for the time of year.

"The rainfall was less than the mean in all districts. Over the greater part of England the fall was scarcely appreciable.

"The bright sunshine was very deficient generally, the possible amount of duration ranging from 23 in 'England, N.W.,' and 17 in 'England, E.,' to only 3 in 'Scotland, W.,' and 2 in 'Ireland, S.'"

MARKETS.

COVENT GARDEN, December 29.

[We cannot accept any editorial responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they fluctuate, not only from day to day, but often several times in one day, ED.]

MARKET virtually closed during the better part of this week. James Webber, Wholesale Apple Market.

POTATOS.

The frosty weather has stopped many of the farmers loading, consequently prices are rather firmer. J. E. Thomas.

SEEDS.

LONDON: Dec. 28.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., write that, owing to the holidays, and also to the dense fog, there was no business doing to-day in seeds. As regards Red Clover seed, American advices speak of strong markets, short supplies, and a large domestic demand. Ryegrass keep firm. The severe weather raises values for blue Pens and Haricot Beans. Bird seeds are without quotable variation. In Rape seed the tendency is upwards. Other articles at this quiet season call for no remark.

FRUITS AND VEGETABLES.

ON account of the Christmas holidays, the various metropolitan markets were closed during the first part of the week, and since then quotations have been somewhat irregular.

STRATFORD, Dec. 28.—The supplies to this market have been excellent during the past week, and, with a large attendance of buyers, a brisk trade was done at the undermentioned quotations:—Cabbages, 1s. 6d. to 2s. 6d. per tally; Savoy, 2s. to 4s. do.; Greens, 1s. to 1s. 6d. per bunch; Cauliflowers, 6d. to 1s. per dozen; Turnips, 1s. 6d. to 2s. per dozen bunches; do., 30s. to 45s. per ton; Carrots, household, 40s. to 50s. do.; do., cattle-feeding, 28s. to 35s. do.; Parsnips, 8d. to 1s. per score; Mangolds, 15s. to 20s. per ton; Swedes, 18s. to 20s. do.; Onions, English, 120s. to 140s. do.; do., Dutch, 5s. to 5s. 3d. per bag; do., Bordeaux, 5s. 6d. to 6s. per case; Apples

English, 2s. to 6s. per bushel; do., American, 12s. to 20s. per barrel; Brussels Sprouts, 1s. to 1s. 6d. per half-sieve; do., 2s. to 2s. 6d. per sieve; Celery, 6d. to 1s. per roll; Horse-radish, 1s. 9d. to 2s. per bundle.

FARRINGTON: Dec. 29.—Quotations:—American Apples, 12s. to 14s. per barrel; Spies, Canadian, 13s. do.; Onions, 5s. per bag; Grapes, 13s. 6d. per box; green stuff, same as last reported.

POTATOS.

Owing to the holidays, the markets were closed until Wednesday, when prices ruled as under:—

LONDON AVERAGES: Dec. 23.—Magnums, 50s. to 70s.; Champions, 50s. to 60s.; Hebrons, 75s. to 85s.; White Elephants, 70s. to 80s.; Early Rose, 60s. to 70s.; Bruce Magnums, 70s. to 80s. per ton.

STRATFORD: Dec. 28.—Quotations:—Magnums, 47s. 6d. to 65s.; Bruce do., 55s. to 67s. 6d.; Imperators, 50s. to 70s.; Main-crop Kidneys, 60s. to 80s.; foreign, 50s. to 80s. per ton.

FARRINGTON, Dec. 29.—Quotations:—Magnums, 60s. to 70s.; Hebrons, 70s. to 75s.; Giants, 70s. to 75s. per ton. For other sorts, see last report.

CORN.

Averages.—Official statement of the average prices of British corn, imperial measure (quarter) for the week ending December 21, and for the corresponding period last year:—1892: Wheat, 25s. 9d.; Barley, 24s. 6d.; Oats, 10s. 10d. 1891: Wheat, 36s. 6d.; Barley, 29s. 1d.; Oats, 20s. 9d.

HAY.

The holidays have much interfered with business: the following are the most reliable figures obtainable:—Clover, 80s. to 100s.; hay, 80s. to 100s.; and straw, 31s. to 36s. per load.

NOTICES TO CORRESPONDENTS.

*** PHOTOGRAPHS, DRAWINGS, OR SPECIMENS.—We shall be pleased to receive from our Correspondents notes relating to interesting Gardens, together with Specimens or Illustrations of interesting Plants. Although circumstances prevent us in all cases from reproducing them, we are nevertheless glad to receive them, and as far as possible to utilise them for the benefit of readers.

CABBAGE STUART & MEIN'S No. 1: Perplexed. You sowed about the right time, i.e., in the first week of August, for turning in, in the spring and summer, but the mild open season caused the plants to become fit for table long in advance of the proper time—in fact, equal in earliness to the usual mid-July sowing. This untimely development has not favoured large growth, hence the smallness of the heads. If you have doubts about the genuineness of the seed supplied, why do you not send some heads of the Cabbage to the dealer?

CORRECTION: Christmas Flowers at Whiteley's. In the last paragraph, p. 764, for 200 read 300 acres.

EXCRESCENCE ON VINE: Y. Such growths are not uncommon. They have been attributed to the action of a slime-fungus, and this view has been corroborated lately by two French botanists in the *Journal de Botanique*, October, 1892, p. 355. We fear there is nothing to be done but cut away the affected parts and burn them.

NAMES OF PLANTS: Lee's Gardens. *Lælia albidia*.

NAMES OF FRUITS: W. R. A, Brabaot Bellefleur; B, Easter Beurrié; C, Bergamotte d'Esperen; D, Ne Plus Meuris.

PEAR WILLIAMS' BON CHRÉTIEN: J. R. H. There is no earlier variety of this Pear.

NEW CHRYSANTHEMUMS.

NORMAN DAVIS

Begs to intimate that he has among the New Chrysanthemums of the present season, several of exceptionally fine quality, including the two magnificent New Crimson Japanese—

WILLIAM SEWARD & J. SHRIMPTON,

the finest introductions of recent years, and which will be distributed by him during the coming spring. *CATALOGUE ON APPLICATION.*

CHRYSANTHEMUM NURSERIES,
LILFORD ROAD, CAMBERWELL, LONDON, S.E.

ANTHONY WATERER

Invites an inspection from intending Planters to the following well-grown TREES, having stout, clean stems, with handsomely-furnished, well-balanced heads, and from frequently transplanting are splendidly rooted; the girth of the stem is taken at 4 feet from the ground:—

- ACER DASYCARPUM, 14 to 20 feet, girth 4 to 8 inches.
- " WIERI LACINIATUM, 10 to 14 feet, girth 3 to 5 inches.
- " NEGUNDO VARIEGATUM, Standards, 8 to 10 feet.
- " REITENRACHI, 12 to 14 feet, girth 4 to 5 inches.
- " SCHWEDLERI, 12 to 18 feet, girth 4 to 8 inches.
- " WORLEYI, 12 to 14 feet, girth 3 to 6 inches.
- ASH, Mountain, 12 to 14 feet, girth 4 to 5 inches.
- BEECH, Purple, Pyramids, and Standards, 10 to 20 feet, girth 4 to 9 inches.
- BIRCH, Silver, 12 to 14 feet, girth 3 to 5 inches.
- CERASUS SEROTINA (American Bird Cherry), 12 to 16 feet, girth 6 to 7 inches.
- CHESTNUTS, Horse, 14 to 20 feet, girth 6 to 11 inches.
- " Double White, 14 to 16 feet, girth 6 to 8 inches.
- " Scarlet, 12 to 18 feet, girth 4 to 10 inches.
- " Spanish, 12 to 14 feet, girth 4 to 5 inches.
- ELMS, English, 10 to 12 feet, girth 3 to 6 inches.
- " Guernsey, 16 to 18 feet, girth 3 to 9 inches.
- LIMES, 12, 16, and 20 feet, girth 3 to 10 inches.
- " EUCHLORA or DASYSTYLA, 12 to 14 feet, girth 4 to 6 inches.
- " Silver-leaved (*Tilia argeotea*), 12 to 14 feet, girth 5 to 6 inches.
- LIQUIDAMBAR, 6 to 10 feet.
- MAPLE, Norway, 12 to 16 feet.
- OAK, English, 12 to 14 feet, girth 4 to 5 inches.
- " Scarlet American, 12 to 14 feet, girth 4 to 5 inches.
- PLANES (English-grown), 12 to 16 feet, girth 4 to 6 inches.
- POPLAR CANADENSIS NOVA (the true variety), 12 to 16 feet, girth 6 to 7 inches.
- SYCAMORE, Common, 12 to 17 feet, girth 4 to 7 inches.
- " Purple, 14 to 16 feet, girth 6 to 7 inches.
- THORNS, Double Pink, 8 to 10 feet.
- " " Scarlet, 8 to 10 feet.
- " " White, 8 to 10 feet.
- TULIP TREES, 8 to 10 feet.
- WALNUT, Common, 10 to 12 feet.

WEeping TREES.

- BEECH, Weeping, Pyramids, and Standards, 8 to 12 feet.
- " Weeping, Purple, Pyramids and Standards, 7 to 12 feet.
- BIRCH, Young's Weeping, Pyramids and Standards, 8 to 14 feet.
- " Cut-leaved Weeping, Pyramids and Standards, 10 to 12 feet.
- ELMS, Weeping, Pyramids and Standards, 7 to 14 feet.
- LARCH, Weeping, Pyramids, 8 to 10 feet.
- POPLAR, Weeping, Pyramids and Standards, 10 to 12 feet.

CROMPTON & FAWKES,
HORTICULTURAL BUILDERS,
CHELMSFORD.

BOOK of Photo-Lithographed Sketches of Winter Gardens, Ranges of Hotheouses, Vineries, Architectural Conservatories, &c., of various Designs and Sizes, recently constructed, erected, fitted, and heated complete by us in different parts of the country; with particulars of the most successful Hotwater Heating Apparatus of the century.
Post-free on application.

FIXED.

THE IMPROVED GARDEN GULLY (VINCE'S PATENT).

This useful invention is a great improvement on the ordinary Garden Grating, and is especially suitable for hilly walks and drives. As they never get stopped by rubbish or sand they effectually prevent the washing away of the gravel in heavy storms, and they save half the labour in cleaning out the cesspools. The prices are:—

6-in., 1s 6d.; 8-in., 2s.; 10-in., 3s.; 12-in., 6s. 6d. 15-in., 8s.
(The larger sizes are very strong for carriage drives.)
Full Particulars and Testimonials on application.

DARLINGTON.

MESSENGER & CO.'S New CATALOGUE of Greenhouses and Heating Apparatus,

Just issued, will be found the most complete, practical, and reliable guide to all about to build, alter, or heat Greenhouses. Illustrations of every description of Glasshouse, from the largest range of Winter Gardens to the simplest forms of Portable Greenhouses, Plant Protectors, and Garden Frames; also of all the best kind of Boilers, Hot-water Pipes, and all appliances for heating. This Catalogue, possessing hundreds of illustrations of all the latest improvements in greenhouse building and heating, is on a scale never before attempted. It should be in the hands of every one interested in gardening, as it contains many practical hints on the subjects of which it treats, the result of many years' experience. Price, 2s. post-free.

A large number of the illustrations are taken from greenhouses erected by us in various parts of the country; an inspection of this Catalogue shows, therefore, buildings the efficiency of which has been well tested by actual use. The advantages possessed by us enable us to carry out work with the utmost promptness, and in the very best style, at prices which defy competition. Surveys made, and gentlemen waited on in any part of the country. Plans and Estimates free on application.

MESSENGER & COMPANY, LOUGHBOROUGH.

NOTICE TO ADVERTISERS.—*In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all. Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisements which they wish repeated.*

GARDENERS AND OTHERS WANTING SITUATIONS 26 words, including name and address, 1s. 6d., and 6d. for every additional line (about nine words) or part of a line. These Advertisements must be prepaid. This scale does not apply to announcements of Vacant Situations, which are charged at the ordinary scale.
Births, Deaths, and Marriages, 5s. each insertion.

POSITION.—*Advertisers are specially requested to note, that under no circumstances whatever can any particular position be guaranteed for advertisements occupying less space than an entire column.*

POSTAL ORDERS.—*To Advertisers, Subscribers, and Others.—It is very important in remitting by Postal Order that it should be filled in payable at No. 42, DRURY LANE, to A. G. MARTIN, as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.*

N.B.—The best and safest means of Remitting is by POST-OFFICE MONEY ORDER.

Advertisements for the current week MUST reach the Office not later than Thursday noon.

All Advertisements should be addressed to the PUBLISHER.

Publishing Office and Office for Advertisements, 41, WELLINGTON ST., STRAND, W.C.

SUBSCRIPTIONS.

All Subscriptions payable in advance. The United Kingdom, 12 months, 15s.; 6 months, 7s. 6d.; 3 months, 3s. 9d. All Foreign Subscriptions, including Postage, 17s. 6d. for 12 months; Post-office Orders to be made payable at the Post-Office, 42, Drury Lane, W.C., to A. G. MARTIN.

Subscribers who experience any difficulty in obtaining their Copies regularly, are particularly requested to communicate with the Publisher (in cases of delay in the delivery by post, the cover should be forwarded with complaint).

WANTED, a HEAD GARDENER, in Herefordshire, where four or five are kept. A civil, sober, and obliging Man, who thoroughly understands his business, and is not afraid of work. Preference will be given to a middle-aged man without family. Reply, with full particulars as to age, experience, &c., by letter only, to A. K., D. Gosden & Co., 17, Tavistock Street, Covent Garden, W.C.

WANTED, a FOREMAN, for the Herbaceous and Alpine Department. State age, wages required, and give fullest information as to situations held since leaving school. References or copies of testimonials should also be sent to RICHARD SMITH and CO., St. John's Nurseries, Worcester.

WANTED, an INDOOR FOREMAN, in a Nobleman's Garden in the North of Ireland, where only Protestants are employed. A sharp, active man, with a good knowledge of Fruit and Plant Culture, and accustomed to House Decoration; 18s. per week, with rooms, fuel, and light.—TREVITHICK, Caledon Park Gardens, Tyrone.

WANTED, a PROPAGATOR, under a Foreman. An active young man, who has been employed in Propagating Rhododendrons and all Hardy Shrubs. Handy with his Knife, &c. State where employed, age, experience, and wages required. A rising position.—CHARLES NOBLE, Bagshot.

WANTED, MEN used to Fruit and Flower Growing under Glass.—State wages required and previous experience to FOREMAN, Turnford Hall Nurseries, Broxbourne, Herts.

WANTED, TWO or THREE young MEN, used to Cucumbers, Tomatos, and Flower Growing.—Apply, F. E. SPARKES, Victoria Nursery, Worthing.

WANTED, ONE or TWO active MEN for propagating and growing Chrysanthemums, Bedding, and other Soft-wooded plants. Must be quick at potting. Wages, 18s. to 20s. per week. Situation permanent to suitable bands.—JOHN STEVENS, The Nurseries, Coventry.

Trade.

WANTED, a MAN, to take Charge of Cut Flower Department; must be well up in Choice Stuff, including the usual run of Orchids for Cut Blooms.—H. DICKINSON, Shardlow, near Derby.

WANTED, a young MAN; one with some experience as a London Market Grower preferred.—J. GRIFFIN, Florist, Market Hall, Southport, Lancashire.

WANTED, a young MAN, used to the general routine of a Market Nursery. Wages, 18s. per week.—HOWARD, Nurseryman, Southgate.

WANT PLACES.

TO GARDENERS, AND OTHERS SEEKING SITUATIONS.

Advertisers are cautioned against having letters addressed to initials at Post-offices, as all Letters so addressed are opened by the authorities and returned to the sender.

B. S. WILLIAMS AND SON beg to intimate that they have at present in their Nursery and upon their Register some excellent Men, competent either to fill the situation of HEAD GARDENER, BAILIFF, FOREMAN, or JOURNEYMAN. Ladies and Gentlemen requiring any of the above will please send full particulars, when the best selections for the different capacities will be made.—Victoria and Paradise Nurseries, Upper Holloway, N.

Gardeners, Farm-Bailiffs, Foresters, &c.

DICKSONS, Royal Nurseries, Chester, are always in a position to RECOMMEND MEN of the highest respectability, and thoroughly practical at their business. All particulars on application. Telegraphic and Postal Address—"DICKSONS, CHESTER."

F. SANDER AND CO. can recommend several highly qualified and energetic HEAD and UNDER GARDENERS, of excellent character, and proved ability; men thoroughly fitted for all the various duties of their profession. For all particulars, please apply to—**F. SANDER AND CO., St. Albans.**

RICHARD SMITH AND CO. beg to announce that they are constantly receiving applications from Gardeners seeking situations, and that they will be able to supply any Lady or Gentleman with particulars, &c.—St. John's Nurseries, Worcester.

GARDENERS.—Our complete and extensive register of GARDENERS OPEN FOR ENGAGEMENT is at the service of any Lady or Gentleman wishing to secure the services of trust-worthy reliable men.—DICKSONS and CO., 1, Waterloo Place, Edinburgh. Established over a Century.

GARDENER (HEAD); age 30.—**J. DUMBLE,** Gardener to Sir Charles Phillips, Bart., Prieton Castle, Haverfordwest, is desirous of recommending his General Foreman, H. Butcher, to any Lady or Gentleman requiring a thoroughly competent man. He has a good knowledge of the different branches of Gardening, is well acquainted with the Cultivation of Fruit (In-door and Out), Flowers and Vegetables, is also a good hand at Table Decorations.

GARDENER (HEAD).—**W. B. FISHER,** Gardener to the EARL CAWDORE, Stackpole Court, Pembroke, will be pleased to recommend Charles Davies to any Lady or Gentleman who is in want of a first-class man.

GARDENER (HEAD).—Age 32, married, no family. A GENTLEMAN wishes to highly recommend his Head Gardener as a thorough practical man.—**COLE, The Gardens, Fogleigh, Box, Wilts.**

GARDENER (HEAD); age 35, married.—**Mr. W. SWAN,** Gardener and Steward to J. P. Bryce, Esq., Bystock, Exmouth, can with every confidence recommend a thoroughly practical man conversant with the requirements of a large establishment and all things pertaining to Horticulture. First-class Orchard Grower and General Plantsman. Highest possible character.

GARDENER (HEAD).—Recommended as an experienced Head Gardener, also well qualified to take Charge and Management of Timber, or of moderate sized Estate. First-class Accountant and Book-keeper. Reference, Sir GEORGE RUSSELL, Bt., M.P., Swallowfield Park, Reading.

GARDENER (HEAD), where three or four are kept.—Age 33, married, no family. Eighteen years' experience. Six years' good character. Vines, Cucumbers, Melons, Flower and Kitchen Garden.—**GEO. GOODSELL, The Gardens, Hazelwood, Morden, Surrey.**

GARDENER (HEAD).—Age 33, single at present. Eighteen years' general experience in high-class Gardening and House Decorations in large Establishments. Abstainer. Well recommended from Nobleman's places.—Particulars to GARDENER, 73, Windsor Street, Fisherton, Salisbury.

GARDENER (HEAD), age 32, married, one child.—**JOHN WILDING,** Wilkey House Gardens, Ruyton-Eleven-Towns, Shropshire, is open to engage with any Lady or Gentleman requiring the services of a good practical man. Can be highly recommended by E. Broughall, Esq.

GARDENER (HEAD WORKING).—Age 29; one child, aged five years; thirteen years' experience in good gardens; good testimonials.—**F. WELLS, 29, Hampstead Road, Dorking.**

GARDENER (HEAD WORKING).—Age 30, no family. Thoroughly experienced in all branches, especially Ferns and Grapes. Seven years' good character, five and a half and ten years previous.—**HOTTS, 2, Hope Terrace, Barcham Wood, Elstree, Herts.**

GARDENER (SINGLE-HANDED, or otherwise).—Young man (age 23); eight years' experience both Inside and Out, and can be highly recommended from last and previous employers. Abstainer.—**C. HURTON, Fiskerton Neas, Lincoln.**

GARDENER (SINGLE-HANDED, or otherwise).—Age 26, married, no family; eight and a half years' practical experience, Inside and Out. Excellent testimonials. Two years Single-handed.—**R. N., Gardeners' Chronicle Office, 41, Wellington Street, Strand, W.C.**

GARDENER (SINGLE-HANDED).—Age 26, married; respectable. Good experience and reference.—**H. J., 22, College Street, Putney.**

GARDENER (SECOND, or SINGLE-HANDED).—Age 21; has had good experience in all branches, Outside and under Glass. Good character.—**C. RICHARDSON, 5, Merton Place, Blackheath Hill, Greenwich, S E.**

GARDENER (SECOND, or SINGLE-HANDED).—Age 26; experienced both Inside and Out. Four years' good character from last place.—**W. KEEN, Roe Green, Kingsbury, Middlesex.**

GARDENER (SECOND).—Age 28; eleven years' experience in good Establishments, Inside and Out. Good recommendations.—**C. BARROW, Thorncombe Street, Bramley, Guildford.**

GARDENER (UNDER).—Situation wanted by young Man (age 24). No objection to one or two Cows. Two years good character. Leaving through no fault.—**W. DEAN, 3, Cavendish Place, Haverock Road, Croydon.**

HOLLOWAY'S OINTMENT AND PILLS.—Diseases of the skin.—No case of disease of the skin, be its nature what it may, has failed to be benefited when these potent remedies have been properly applied. In scrofulous and scorbutic affections they are especially serviceable. Scoury and eruptions, which had resisted all other modes of treatment and gradually become worse from year to year, have been completely cured by Holloway's cooling Ointment and purifying Pills, which root out the disease from the blood itself, and leave the constitution free from every morbid taint. In the nursery Holloway's Ointment should be ever at hand; it will give ease to sprains, contusions, burns, scalds, and infantile eruptions, and may always safely be applied by any ordinary attendant.

AWARDED TWENTY PRIZE MEDALS

AT INTERNATIONAL EXHIBITIONS AT HOME AND ABROAD.

KEITH'S PATENT BOILERS, THE "CHALLENGE," "VIADUCT," "PYTHON," &c.,

FOR HOT-WATER HEATING, "STAND FIRST," require no building work around them, are entirely water-jacketed, and heat from 50 feet up to 20,000 feet of 4-inch pipe respectively. Many thousands are in use all over the world, and the Boilers are unrivalled in power and economy.

Manufactured under 30 James Keith's Patents in Great Britain, United States, and Canada.

This Engraving "illustrates the most powerful form of Boiler that has yet been made for Hot-water Circulation."—Extract from Hoon, on *Warming by Hot-water*, New Edition, 1891.

KEITH'S "PYTHON" BOILER, as illustrated, has 1,000 square feet of effective heating-surface, with $17\frac{1}{2}$ square feet of fire-grate area, heats about 20,000 feet of 4-inch pipe, and is the Most Powerful and Complete Sectional "Special" Hot-water Heating Boiler in the World.

JAMES KEITH (C.E., Assoc. M.Inst.C.E.), Gas, Hydraulic, Heating, Ventilating, and Consulting Engineer. Established 1823. Contractor to Her Majesty's Government. 57, HOLBORN VIADUCT, LONDON, E.C., ALSO AT EDINBURGH AND ARBROATH.
